Road building in very dry climat is beset with troubles the reverse those in most parts of the countr The average road builder is contin ally striving to improve the draina of his roads, and to keep water awa from them. They are best maintain by dragging, but in a country whe there is very little rain a well-dragg road is a luxury. In the Imperial Va ley, for instance, water obtained pr marily for irrigation is used to w highways before dragging ther Water has also been diverted from ir gation to road building in Arizona a New Mexico. In Utah, after attemp ing without success to keep grav roads in good condition by sprinklin them with watering carts, an exper ment is now being made with mo drastic methods, the roads bein drenched instead of sprinkled. I most cases, however, oil is used rath than water, but unless it is of an u usually good quality for the purpos the results are not good. The du from a road sprinkled with an unsui able oil, in the very dry regions, sometimes almost suffocating, ar more objectionable than that from a unoiled road.

MEASURING HAY

A question which often comes to th Cultivator has to do with estimatin weight of hay in stack or mow whe dimensions are known. This is question involving several angl which should be understood befo one can make very accurate estimat The entire question is discussed Circular No. 67 of the United Stat department of agriculture, "Measurin Hay in Ricks or Stacks." It will be interest to those who wish to estima weights of hay or straw.

DEMONSTRATION BY CORN GROWERS

Continued from Page 431

what we call the King Phillip variety. It is a variety of Flint corn and that is all we knew about it. We haven't had experience in seed selection. If a man in spite of all this, and in spite of the general ignorance of the people in raising corn, can deliver the goods in quality equal to the best raised in the Middle West, and according to the Sperry Flour Company, our quality is a whole lot better, what can we do with experience and study of our conditions? It seems to me if we are going to get into the game and make it what it ought to be, that it would be a good idea to form a corn growers' association, and get a first class man from the Middle West, say from Iowa, and pay him to come out here and teach us how to raise corn according to the most scientific methods, and tell us how to overcome the problems we California farmers are up against. We will work it out eventually, but we will work it out quicker by having a man who has already worked out the problems.

Another good thing would be the laying of plans to get hold of 100 to 150 acres of land for raising seed. Iowa seed corn is quoted at $3.75 a bushel, f.o.b. cars. We don't care so much about the price of the corn; it would cost only about 35 cents an acre.

As I said before the corn industry is far reaching in its results. In the Midde West corn is raised for fattening cattle and hogs, and very much of this corn is sold as beef and pork, and this can be made possible right here in California. We certainly need something like that in this state. Such an industry stands for state advancement.

In another Cultivator we will quote from addresses by J. M. Bigger, a practical grower, also by Mr. McLeod, a grain expert of the Sperry Company.

PASS IT

The Farmers' Protective League is urging the passage of an act defining the crime of criminal syndicalism and prescribing punishment. Section 1 defines:

"Criminal syndicalism is the doctrine which advocates crime, sabotage, violence, or other unlawful methods of terrorism as a means of accomplishing industrial or political reform. The advocacy of such doctrine, whether by word of mouth or writing, is a felony punishable as in this act otherwise provided."

Other sections provide punishment for one who advocates or teaches propriety or necessity of crime, sabotage, violence or other unlawful methods of terrorism. It appeals to us that such a bill could have no great opposition except from those who wish to commit or encourage the crimes referred to.

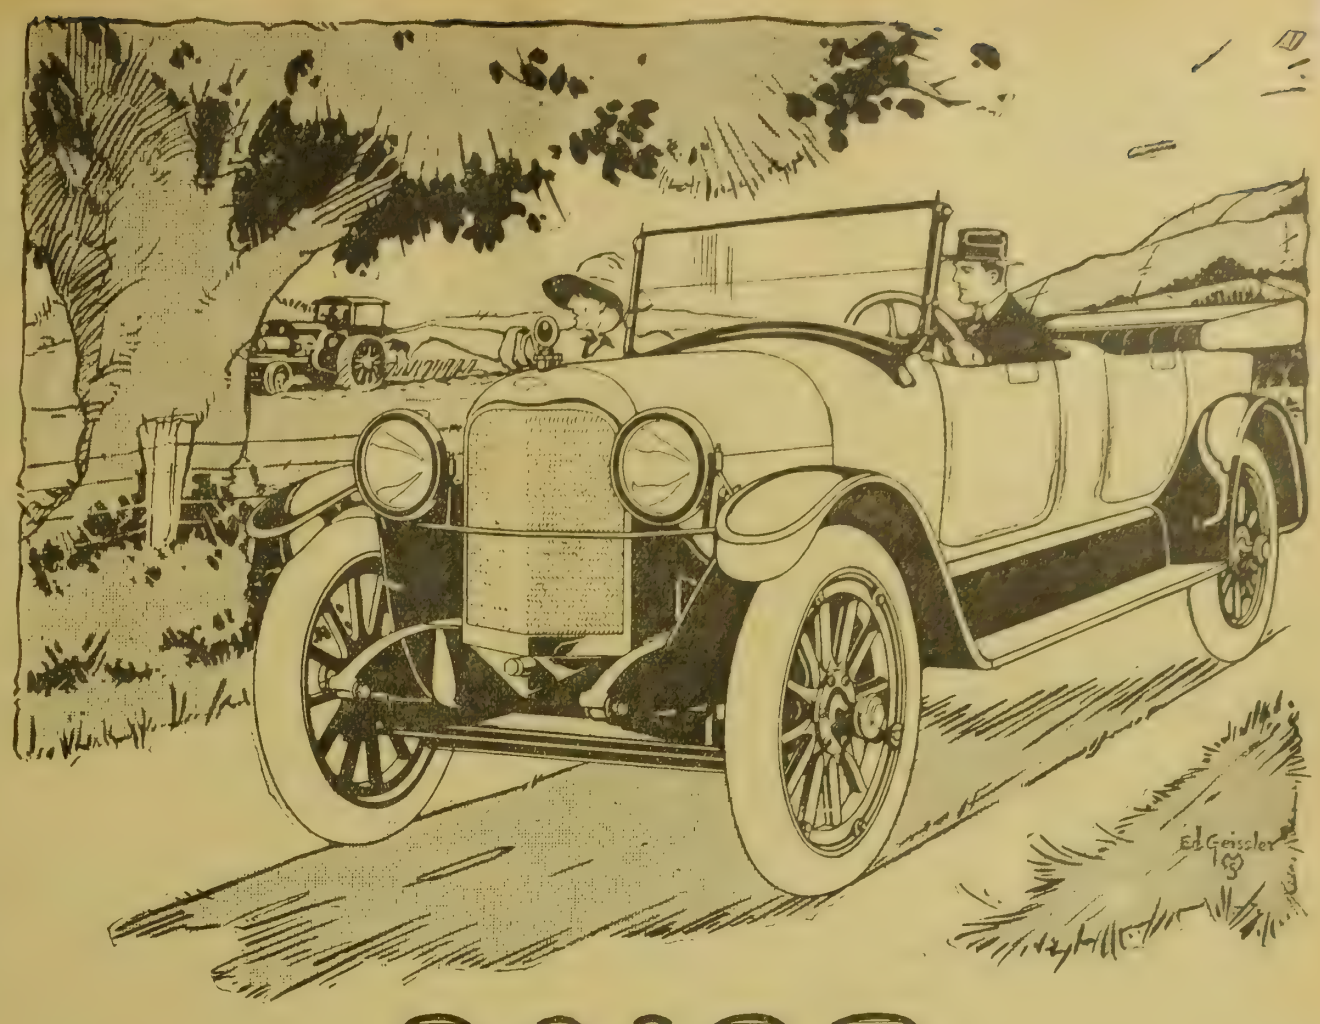
MAKERS OF NORTHERN CALIFORNIA

One of the classiest publications which has come to our table in a long time is "Makers of Northern California," a compilation of biographical matter with portraits of many men and women who are responsible for the great advancement which has been made in the North, especially in the Sacramento Valley and in the cities of San Francisco and Sacramento. It was issued by the Sacramento Union and adds to the permanent historical matter of California.

GIVES BUILDING TO SAN DIEGO

The International Harvester Company of America has donated to the city of San Diego its building and the ornamentals on the grounds around it in the International Exposition grounds. This building is one of the more beautiful on the grounds, and the action of the company is giving it to San Diego has brought forth most appreciative expression.

Mr. Clayton F. Palmer of the Los Angeles city schools has made extended report as to agricultural practice in demonstration schools in that city. There are fields covering several acres which are used for demonstration grounds and about 40 teachers are employed in giving agricultural instruction or, more particularly, instruction in gardening. The idea in the city schools is not to make farmers but to give city bred pupils something of a knowledge of how things grow.



PAIGE

The Most Beautiful Car in America

The Final Test of Quality

IT IS a matter of record in fifteen of the principal cities that Paige used cars bring a higher price—proportionate to first cost — than any other American automobiles.

And here, after all is said and done, is the final test of quality.

A used car has been "through the mill." Its motor and all of its working parts have been subjected to constant strain.

Its "finish" has been knocked off—*if it will come off at all.*

Its gears, its rear axle and its transmission have endured the punishment of day-in and day-out pounding. All of its weakness is plainly evident—and likewise its *strength.*

The used car either stands before you a broken down, dispirited "has been"--or a strong, robust champion of many battles--ready and eager for all the service that man can give it.

That, we repeat, is the final test of quality.

And in this test the Paige stands supreme. *After fifteen, twenty-five, thirty-five thousand miles of service, there is still enough GOODNESS left in a Paige to command the record price in used car markets.*

Frankly, now, is there anything that we could tell you about our product that would be more convincing? Could you have any better guarantee that a Paige is all that we claim it to be—all that you could possibly expect it to be?

As to the selection of a model, this is simply a matter of your own personal requirements.

In our line there are two seven-passenger cars, a five-passenger car and two roadsters. You, alone, can make a choice, but please remember that you can't make a *mistake.* For all of these models are Paiges—blood brothers of the same strain. That is the really important thing.

But don't lose any time. See your Paige Dealer today. Let him give you the kind of demonstration that will definitely settle your automobile problem, and place your order while we can still promise early deliveries.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Grow a garden. Teach the kiddies to work it. It's a pleasure and an education which they should not be deprived of. Doesn't the photo of a real California garden with real California boys inspire with a desire to have a garden of your own?

WHAT SHALL WE PRODUCE?

Grow everything this year. It will mean individual prosperity and national safety.

We say "grow everything", yet it is a time for using judgment. Staples are the safest and the most needed. The one most often referred to is the potato. In every city vacant town lots have been planted; farmers have planted extensively and yet it appears that satisfactory prices must obtain. California's potatoes will be the earliest in the market, and while the spring grown crop is a poorer keeper the immediate demand will probably care for it at once. However, the planting season for California's spring crop is practically past.

As to wheat, spring planting over much of the East will be heavy. But a wire from Washington under date of April 7 shows condition of winter wheat the United States over as 63.4 per cent, while the ten years' average on same date is 86.2. California shows better with this year's condition 83 per cent of normal.

Next in favor are beans. They are a staple; they will be in great demand and present prices are the highest which have ever prevailed. Prices to the grower of Limas are now around $9.00 and $10.00. Blackeyes, Whites, Pinks and others all show most satisfactory conditions. Next week's Cultivator will have information regarding methods of planting and growing.

California will plant largely to rice. The Sacramento and San Joaquin Valleys will produce large and the Imperial Valley will plant some rice, and thousands of acres which have never produced anything but mesquite will this year grow alfalfa and grain for stock. The present week's rain has done a world of good in many sections of the state.

The fruit crop may not be a bumper one, but every preparation is made for its conservation. Let every orchardist thin his fruit, if the trees are overloaded. Let the best of care and cultivation be given, for every can and sack of holdover fruit has been practically cleaned from the market. Prune buyers are freely offering six cents or more. The cooperative associations will probably net still better. The way to produce the largest, meatiest and most profitable prune is to irrigate heavily and cultivate continuously.

Plans are in the making for an immense sugar crop. California will produce more this year than any preceding year. We believe every factory will exceed its former output.

Many an orchardist with trees not yet in bearing is planning for beans, corn and grain sorghums or something between. The discouraged poultryman is looking about for opportunity to grow his own grains. At present feed prices egg production is almost prohibited.

In addition, safeguard the moisture in the soil; every attention should be given to fullest use of irrigation waters. We have heard it said that if Germany had fully appreciated the value of irrigation by using the waters of her rivers she could have fed her people. Western America has learned the lesson of irrigation and upon us rests a great responsibility.

LABOR IS SCARCE

Possibly the most serious problem will be that of labor. It will be a year of "overtime". Every farmer's hours may be 16 rather than ten. To the end that this difficulty may be minimized labor saving implements must be provided and efficiency secured in every motion.

ONE WASTE TO BE SAVED

At a conference of agricultural experts at St. Louis, Secretary of Agriculture Huston and others suggested that "It is necessary to divert the grain and other products used in distilleries and breweries to other sources. So from an economic and not a moral standpoint prohibition during the war is necessary." And recommendation has been made to congress that with this serious situation now facing the world it is worse than folly to destroy the economic worth of thousands of tons of grain.

NO OVERPRODUCTION

In any case, don't fear overproduction. If the war should stop today Europe will still starve unless America feeds her. And prices for all foodstuffs are bound to be high. Both patriotism and chance for profits should move the farmer to produce to the limit. Never in the world's history was there such a shortage of food. It has even been seriously suggested that unless farmers strain every effort to increase production the government must turn farmer, either with its trained soldiers or otherwise. The war we have entered is not of our choosing, but the conditions it has created put a big problem and a big opportunity up to the farmer.

GROW A GARDEN

One feature which will this year prove profitable and satisfactory is the home garden. The orchardist may say his ground is worth too much to give up to the growing of green stuff which he can buy from the "Chinee" vegetable man for a nickel or two bits. This may be true, but we believe that where a plot of ground is available and plenty of fertilizer is used, a crisp head of lettuce or a few beans or ears of corn will by their better quality convince the home gardener that greater satisfaction is had in the home grown stuff, and if properly handled the greatest profit of the ranch may be had in the little garden patch.

EDUCATIONAL AIDS

The federal department of agriculture is aiding in the campaign for more and better production, especially with regard to gardening and truck farming. The California state experiment station has called conferences of its staff and is consulting with our leading agriculturists and endeavoring in every way to be helpful in the campaign. College presidents of the southern part of the state have gathered together and advised as to means of encouraging production.

The experienced farmer may ask why all this effort after our years of experience, but these must understand that there are thousands this year endeavoring to produce who have no experience and they will make many mistakes. In the vacant lot campaign in Los Angeles a street car ride of a dozen or more blocks shows the failures which are being made in this farming attempt. Weeds are receiving more of the soil's nourishment than the crops.

HOLD FAIRS

Above all we need more and better agricultural fairs. Our state fair should be built up and the present effort to hold a 30-day agricultural fair and exposition in the southern end of the state should be encouraged, as should be every district or county fair. It has been suggested that "Energy and money should not be wasted on this type of entertainment." We protest, for if ever there was a period when the inspiration and education which comes from a truly agricultural fair was needed it is the present. The French realize this, and at this moment when every possible effort is being made to drive an enemy from her soil she is also making every effort to feed her own people. Two of her principal agricultural communities are now holding agricultural fairs. If France, with her intensive cultural methods, feels the need of still more intensive methods and is encouraging them, America surely should be as wise.

HOME ECONOMICS

While it is a year for producing to the limit, it is also a year for conserving to the limit, so pardon a preachment to the homemaker. Notwithstanding prices are high most of us are in a situation where we are not willing to deny ourselves most of the food articles we are used to. There are those, however, who of necessity must economize. Assume for a moment that some of these are of the type which recently stormed the city hall in New York and demanded bread. There are all stages from that up. These people were suffering because of the high prices, but perhaps more because of their lack of ability to meet the conditions. Their menu is limited. Possibly it consists of meat, potatoes and bread. Their ability in cookery is limited. Before high prices came they had been used to purchase the very cheapest cuts of meat; when the cheap meats became high they had no option but to go without because they had no ability to adapt themselves to other foods. The homemaker who can plan other dishes and conserve on the more common ones which the poorer cook feels she must have should aid to this extent. Because a family has accustomed itself to a few kinds of food is no reason why it should not accustom itself to others equally nourishing when the prices of the favored foods have soared beyond reason.

The department of agriculture is issuing some very practical circulars, "Food Thrift Series 1917" which contain help of immediate value to the searcher for economical and nourishing foods. These may be secured free by anyone who writes for them to Office of Information, Department of Agriculture, Washington, D. C. The same office also publishes other bulletins on foods which will be sent on request. Another series of particular benefit at this time is "Food Series 1917". Our state university at Berkeley has also recently published "Home and Farm Canning" which gives specific directions for saving surplus vegetables and fruits by canning. If advantage is taken of these and other aids freely at hand it will go a long way toward solving the food problem before us.

Agricultural Notes

Spain reports ample supply o wheat, the 1916 production being wel over that for 1915.

Potash as a by-product of cemen manufacture is now being produced i a cement plant of Ontario, Canada.

For guarding railroad bridges an crossings Europe is using at least 500, 000 men, or an average of five me for every mile of track.

Southern vegetable growers ar marking containers with quantity o contents. The department of agricul ture has ruled that crates and no quart or pint boxes must be marked.

A press dispatch from Seward Alaska, says that 136 miles of th government railroad are now in opera tion, with trains running each wa daily.

Ecuador's rice crop for 1916 was a total failure due to drouth and it wa necessary to import the country's sup ply from the United States. This yea however has given plenty of rain an the estimated production is 15,00 tons.

War has revolutionized the tillag of soil in the Scandinavian countrie by introducing the work of tractors The tractors are as a rule purchase on the community plan, several farm ers banding together in making th purchase.

Philippine lumber is supplantin Oregon pine in the Hong Kong mar ket. Formerly exports of Oregon pin to this port aggregated 10,000,00 board feet annually. High freight rate in the trans-Pacific trade have force its displacement.

Uruguay finished a live stock cen sus in January. It shows a total o 7,942,212 head of cattle in that country The taking of this cattle census i only one of various measures whic the government is adopting for the de velopment of its live stock industry the chief source of the country' wealth.

Holland, although in normal time a great exporter of dairy products, i now suffering from the decrease in milk. This is attributed to a lack of the stimulating and nourishing fodder now almost unobtainable, which was imported in large quantities before the war and was added to the usual native cattle feed.

The confectionery industry of the United States represents the investment of $110,000,000 capital, turning out confectionery annually to the value of $183,000,000. On the basis of a population of 102,000,000, this means a net expenditure of $1.80 a year for every man, woman, and child in continental United States.

The capacity of the national forest range is gradually being increased by protection against overgrazing and improved methods of handling the stock. New areas are also being brought into use by the development of watering places, while the eradication of poisonous plants is reducing the losses suffered by the stockmen.

An indication of present tendencies toward state bond issues for good roads is shown in the following list of issues recently voted or now being agitated: Pennslyvania, $50,000,000; Illinois, $60,000,000; Colorado, $50,000,000; New Jersey, $7,000,000; Louisiana, $20,000,000; California, $15,000,000. To these may be added $75,000,000 appropriated by the federal government which will be duplicated by the various states, making an additional $150,000,000, or a total of $352,000,000.

Agricultural News Notes of the Pacific Coast

Northern California

May 1 will mark the opening of the trout season.

The state fair opens in Sacramento September 8.

Farmers' short courses at Davis will be held May 29-June 1.

A farm center has been organized at Elk Creek, Glenn County.

Middletown, Lake County, has formed a local of the Patrons of Husbandry.

The Glenn County farm bureau has worked out a very complete marketing system.

Shasta and Trinity Counties will soon began a war of extermination on coyotes.

An experimental planting of long staple cotton will be made near Esparto in Yolo County.

The California Prune and Apricot Growers' Association is making a final campaign for membership.

Thousands of acres of lands in Butte, Glenn, Yuba, Colusa and Yolo Counties have been leased by Hindoos for rice planting.

Arbuckle, Colusa County, reports prospects for a heavy almond crop this year, the frost having done practically no damage.

The Glenn County farm bureau announces the following schedule: Orland April 16-17, Jacinto 19-20, Elk Creek 23-24, Plaza 25-27.

The Nevada County Cannery Association has disposed of its final lot of 12,590 pounds of dried pears. This closes out their 1916 pack.

The farm adviser of Solano County has made a survey of that county with the view of taking up marketing of live stock by auction sale.

Members of the Glenn County farm bureau are planning their agricultural exhibits to be made during the county fair, to be held September 26-29.

The Mendocino Stockmen's Association is today holding a meeting at Ukiah. Protection of stock interests of the county will be discussed.

Several rice growers of the district about Gridley, Butte County, are planting their last year's rice fields to melilotus, which they expect to choke out the water grass.

Experimental work in the destruction of wild mustard by spraying with sulphate of iron is being conducted by Horticultural Commissioner Gould of Yolo County at the state farm.

April 10 was squirrel execution day in Yolo County. The board of supervisors and the directors of the farm bureau made every effort to bring out all the farmers in the county with their shotguns.

"Both for economic and patriotic reasons", Secretary of Agriculture Houston is appealing to American farmers to strive for highest efficiency in production and conservation of agricultural food products.

Because of unusually late and heavy snow storms in Northern California and Southern Oregon many cattle have been deprived of grazing. Some farmers in those sections have conceived the idea of bringing in hay and grain by parcels post to tide the cattle over.

The California assembly committee of agriculture has decided that all oranges offered for sale and shipment in California must meet the eight-to-one test unless they have been "left long enough on the trees to be substantially colored."

Central California

Today is cleanup day at Patterson.

Madera wants a fruit packing plant.

The Dinuba grange holds its meeting today.

Turlock is assured of the building of a milk condensary.

Work on the new sugar factory at Manteca is being rushed.

Modesto is planning the formation of a street tree improvement district.

The Prune and Apricot Growers have begun another campaign for securing membership.

The olive cannery at Lindsay is signing up acreage in canning tomatoes to be handled this summer.

Fig growers of Stanislaus County are meeting today in Ceres to consider marketing prices of figs for 1917.

Hay shortage is serious throughout the state. Prices are higher, it is reported, than at any time since 1864.

Dairymen of Merced County have formed a cooperative cow testing association with an initial membership owning 700 cows.

Prune and apricot growers of Tulare County met in Visalia last week to discuss the business of the Prune and Apricot Growers' Association.

Swine raisers of Tulare County are considering a plan to establish a monthly market day similar to that now observed in Kern County.

W. A. Sprott, manager of the Tulare County Citrus Exchange, has been in Sacramento conferring with legislators on the citrus standard of maturity bill.

News has been received of the death at Hanford of Elias Gallup. Mr. Gallup was one of the pioneer pure bred poultry and Poland-China growers of Kings County.

A recent report issued by the Turlock Irrigation District shows that there are in that district 116,399 acres planted to crops. Thirty-seven per cent of this is in alfalfa.

A new plan for ridding Stanislaus County of rabbits is being urged on the supervisors. This is the payment of a bounty of five cents per head, later to be raised to ten cents.

Horticultural Commissioner Roullard urged deciduous fruit growers this spring to avail themselves of the heat from smudge pots in their orchards to protect the blossoms and young fruit.

Mark Basset of Hanford recently received 13 cents per pound for a carload of hogs shipped to the San Francisco market. The hogs were all grain-fed Poland-Chinas and averaged 200 pounds.

Tulare County's citrus industry, according to report of the Tulare County board of trade, brings in the largest returns of any single industry in the county. This year's figures are $5,767,819.

County Horticultural Commissioner Roullard of Fresno states that he is trying to secure a lady beetle which feeds on the citrus fruit mealy bug to see if it will destroy the mealy bug which is destroying grapes in Fresno County.

Alfalfa growers of the Dinuba and Kingsburg district are interesting themselves in the formation of an alfalfa growers' association. A form of agreement has been drawn up and signatures of growers are now being secured.

Southern California

Several farmers at Murrietta are dry-farming alfalfa.

Work will soon be begun on the construction of the La Mesa dam in San Diego County.

Ten sugar beet growers' associations have been organized in Southern California this spring.

Stocks of Lima beans in California March 1 are reported to total 212,949 sacks, Blackeyes 70,688.

W. B. Parker of the state university is taking charge of the farm bureau organization movement in Riverside County.

More than 200 Mexicans and Japanese orange pickers in the Arlington packing houses went out on strike last week.

Banning has organized a farm bureau center with M. F. Gillman director. A membership of 100 is already reported.

Proposal to establish a bean canning plant at Santa Paula is being considered by business men and farmers in that section.

S. S. Rogers of the state university farm at Davis was in Oxnard yesterday to talk to farmers on the growing of vegetables for canneries.

The bean crop on the Irvine ranch of Orange County will total $1,260,000 in value. Buyers are reported in the field offering from $9.00 to $9.30.

There is friction between the board of supervisors of San Diego County and the farm bureau, and further support of the farm adviser has been withdrawn.

Nearly 13,000 acres have been planted to cantaloupes in the Imperial Valley this year. Brawley, which has the largest acreage, has almost 5000 acres in melons.

An apricot grower at Fillmore, Ventura County, used smudge pots successfully in his orchard during the recent frosts and reports that his crop showed no damage.

Two hundred Mexicans were brought in from El Paso last week to work in the orange groves at Riverside and Redlands to take the place of the striking pickers.

The apricot crop of Orange County is estimated at between $250,000 and $300,000. Contracts are reported being made at 11 cents per pound. Most of the growers are holding for better.

The city of Los Angeles has filed application with the state water commission to appropriate waters of Rock Creek, Sawmill Creek and Baker Creek, all tributary to the Owens River.

That the flood control bill allowing formation of flood control districts embracing two or more counties will pass the legislature is the prediction of Francis Cuttle of Riverside, who has just returned from Sacramento.

The longer bean picking season in Ventura this year has much reduced the amount of county aid to indigents. It is stated that those who have received county aid stuck to the job as long as there were any beans to be picked.

Eight packing houses of Riverside are reported to be planning to close down until the present labor situation is settled. They have asked the railroads to bring in 1000 men to work in the groves. The present wage scale is $1.75 to $2.25 per day.

The Coast

Cove, Oregon, reports hay selling at from $18 to $20 a ton.

Apple growers of the Wenatchee district expect to ship out 8000 carloads this year.

Idaho bee raisers report a loss of 50 per cent of their colonies from the severe cold winter.

Lambs are selling at Union, Oregon, at $13.50. One sale of 248 head was reported at this price without a cut.

Farmers of Fremont County, Idaho, are organizing a farm bureau and hope to have a county agent appointed soon.

Apple growers of the Willamette Valley have organized a fruit exchange controlling some 15,000 acres of bearing trees.

The North Portland Union Stock Yards reports top sales of hogs at $14.45, with the bulk of the sales at $14.25 and $14.35.

The sale of 103 steers at Nampa, Idaho, is reported by the manager of the Nampa Live Stock Commission Company at $10,094.

The federal farm loan board has announced that interest rate on its loans will be five per cent and the rate on bonds issued by the land banks, 4½ per cent.

Central Oregon stockmen are anxiously hoping for warmer weather that will melt the snow, which still covers the range land, as the feed is getting very short.

It is estimated that four-fifths of the water available for irrigation and domestic use in the state of Oregon comes from the timber clad slopes of the national forests.

Pure bred cattle owners of Yamhill County gathered at the office of the county agriculturist last week to discuss methods of improving their breeds, especially by the bringing in of registered sires.

Two farmers near Chandler, Arizona, were last week arrested for flooding the roads with irrigating water. These were the first arrests made on this charge.

April 6 was Arbor Day through Northern Arizona. Southern Arizona held its Arbor Day two months ago. The season is much later in the northern part of the state.

Three counties in Washington contemplate road bond issues aggregating $2,000,000. Petitions which are being circulated in this connection call for a system of concrete roads.

Stockmen of the Northwest who are now delivering cattle on contract prices ranging from eight to nine dollars are feeling most unhappy because if it were not for the contracts they would be getting $9.50 or better.

The New Mexico Wool Growers' Association estimates that coyotes are costing sheepmen of New Mexico every year more than a million and a quarter dollars. The association is planning a campaign of extermination.

A comparative table of top prices for live stock at the Portland stock yards for the past three years shows the top price for steers on March 29 to have been $9.75 against $7.75 in 1915 and $8.50 in 1916. The top price for cows on same date was $8.00, $6.65 in 1915, $7.50 in 1916. Top hog prices this year $14.50, $7.75 in 1915, $9.25 in $1916.

Borrow Money at 6 per cent and make 30 per cent with an IDEAL GREEN FEED SILO

Now is the time to place your order for an IDEAL GREEN FEED SILO. Put that first crop of alfalfa into it. It won't make good hay, but the alfalfa, foxtail and weeds will make excellent silage. Have silage to feed this summer when green feed is gone. You can thus increase your milk profits 25 per cent and reduce feeding costs 15 to 20 per cent during the coming dry season. The silo will be empty in time to fill with corn this fall for winter feeding.

Refrigerator Type Doors; Air and Water Tight Foundation Joint; Proper Design; Selected Materials and Painstaking Workmanship make the Ideal Green Feed Silo a Safe, Profitable Investment for the Dairyman or Stock Raiser. Send for Catalog.

Acme Feed Cutter and Silo Filler

Mounted on Truck **Low Feed Table** **Rigid Construction**
All Steel Frame **Automatic Feeding Device** **Light Running**
Positive Safety Device **Reversible Feed Rollers** **Easy to Handle**

EQUIPPED WITH ALFALFA MEAL MAKING ATTACHMENT

An excellent quality of alfalfa meal can be produced on this machine at a cost not exceeding half of that for baling.

SAVE $3.00 PER TON ON DRY FEED

Run it through an Acme Feed Cutter so that the coarse hay as well as the fine will be entirely consumed by your cattle.

California State Fair 1916

The Type We Are Breeding For

Hardy, prolific sows of best blood lines and breeding. Strong, upstanding, prepotent boars. In short the best possible specimens of the Berkshire breed. We plan to do this by breeding large numbers and from them making a rigid selection.

James Mills Orchard Corporation

Hamilton City, California

D. O. Lively Stock Farm's

FIRST ANNUAL SALE OF

REGISTERED HEREFORD CATTLE

Will be held under the auspices of the American Hereford Cattle Breeders' Association at

Mayfield, California, Thursday, May 3, 1917

The offering will be made up of sixty-five head—twenty bulls and forty-five females. A splendid opportunity to start a pure bred herd. Write for catalog.

D. O. LIVELY STOCK FARM, 215 Hobart Bldg., San Francisco

Use Tuberculin Tested Sires in Your Herd

WE HAVE A NICE LOT OF SHORTHORN BULLS and HEIFERS THAT WILL SELL FAST WHEN THE SPRING FEED COMES. SELECT YOURS NOW FROM THE BRIGHTON FARM HERD.

Northern California Live Stock Notes

Written for California Cultivator By W. S. Guilford

GOPHERS AND LIVE STOCK

There are many thousand acres of "dry" alfalfa in California. This is alfalfa planted on good loam soil on ridges or along streams, that will yield one to three or four crops without irrigation.

I wonder if anyone has figured out how much the live stock carrying capacity of ranches having such fields could be cut down by allowing gophers to work in them unmolested?

There are stands of alfalfa that have been absolutely ruined by gophers and many others where the crop is very materially reduced.

A good trapper with simple traps can keep a field comparatively free from gophers at small expense as compared to the results obtained. Some ranchers pay a trapper five cents apiece for gophers. At first a trapper can make good money at that, but when the gophers begin to get scarce he may quit the job. It might be possible for a half dozen ranchers to keep a trapper busy.

This is one of the little items—often overlooked on a ranch—that will pay big returns.

MILKING MACHINES

The perfection of farm tools and machinery has gone forward at a very rapid rate during the past few years. Now thousands of milking machines are in successful use all over America.

A recent report to the Highland Society of Scotland pretty well sums up the situation. It concludes "that there are several reliable milking machines now on the market, and their success or failure in everyday use depends entirely on the care bestowed on them and the interest taken in their working."

PURE BRED STOCK PRICES

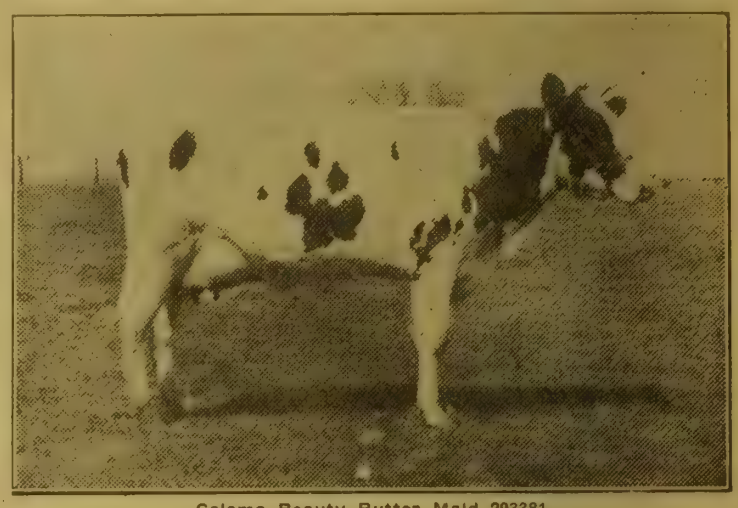
Reports of sales of registered live stock in Europe indicate higher prices for good animals, and the sales in the Middle West are holding up to a high standard.

One hundred and forty-four Herefords sold in Missouri for $184,450, an average of $1281, with one bull selling, to go to Canada, at $11,900.

With prospects for continued high prices of meats and other food an investment in pure bred animals, even at the present high prices, would seem to be good business. For instance, farmers who are selling 260-pound hogs for $24 at home can well afford to pay $50 to $150 for good pure bred sows with which to add new blood and strengthen their herds. And no one can afford to use a scrub bull or ram at any price.

HOLD OVER FEED

"I never like to feed the last forkful of hay on the place," said a prosperous stockman recently. "Even if grass is here and hay ready to cut soon, there is a feeling of security in having hay left over from season to season that I like to experience." Which is pretty good gospel. To have more stock than feed means either suffering or sale at a sacrifice price.



Coloma Beauty Butter Maid 293381

A Holstein belonging to Alex Whaley. She has produced 426 pounds of milk and 19.44 pounds butter on 80 per cent basis in seven days.

Value of Finely Cut Alfalfa

TOUCHING upon the value of cut alfalfa, the Minden Butter Manufacturing Company, of Douglas County, Nevada, writes to the De Laval Dairy Supply Company:

"To give you an idea as to results we obtained by feeding hogs with alfalfa meal and buttermilk, against straight alfalfa fed in racks and buttermilk in troughs, can give you comparative figures as follows:

"About a year ago we took in 100 head of stock hogs, average 105 pounds each, fed them for two months on straight buttermilk and loose alfalfa, fed in racks. During this time we fed out one and one-half tons of third crop alfalfa. At the end of two months these hogs were put in our fattening pen at an average weight of 158 pounds each, and then topped off on a heavy mixed mash of ground corn and barley, mixed with buttermilk, fed for two months and put on the market at an average weight of 206 pounds. The next lot of 100 hogs taken in weighed 98 pounds each and were fed for two months on one and one-half tons of ground alfalfa meal, mixed thoroughly with the buttermilk, and were then put in our fattening pens at an average weight of 163 pounds. This lot of hogs were topped off on the same mixture of feed as the first lot, only that we fed them small portions of the ground alfalfa in the dry meal condition in a special trough. These we put on the market at an average weight of 218 pounds.

"From this schedule you will note that the second lot of hogs fed on the ground alfalfa meal gained 12 pounds in the first pen and seven pounds in the fattening pen, over the lot of hogs fed on the same feeds with the whole alfalfa. Our whole alfalfa in this case we figured at eight dollars per ton, with a cost of $2.15 per ton for grinding, and our actual profit by reason of feeding the alfalfa meal was 1900 pounds, at seven cents per pound, or $133, less the cost of grinding, which amounted to $3.25 or thereabout.

"May also state that we have experimented with other feeds, such as bran, wheat, barley and oats, and after trying them all we have come to the conclusion that our method of feeding alfalfa meal, ground barley and corn, along with our buttermilk, is the most profitable by a long way.

"The above are the exact figures that our demonstrations have shown and we are quite sure will prove of great interest to anyone who is interested in the hog business. Alfalfa meal, however, we would not recommend as a fattener, but we can recommend it as a mighty good feed to put the frame on the critter."

Dairying is more thoroughly studied today than ever before. It is being made a practical science by thousands of progressive farmers the country over.

Field Notes from the Live Stock Men

A. W. Morris & Sons have a group of good ones just going on official test in their registered Holstein herd, and within the next couple of weeks there will be some good records to report.

The American Berkshire Association has provided for special premiums amounting to $1200 at the National Swine Show to be held at Omaha, Nebraska, which together with $800 offered by the National Swine Growers' Association, will make a classification of $2000 for Berkshires at that show.

W. H. Waugh writes: "I have just learned that $88,000 worth of hogs have left Riverside, San Bernardino and Imperial Counties for Nebraska, where they will be fed. Many people here have made the mistake of disposing of their stock on account of high feed cost and they will wish they had them back before snow flies.

Fred W. Kiesel, president of the California Holstein-Friesian Association, has called a meeting of the association to be held at Hotel Hughson, Modesto, on the evening of Wednesday, April 18 at 8 o'clock. A good program has been arranged and the occasion will be one of the get together kind for Holstein breeders and dairymen.

At the H. I. Shaw dispersal sale, the first sale of the kind ever held in San Diego County, the registered Holsteins averaged $244. The top price of the sale was $425 for a five-year-old granddaughter of Juliana King of Riverside. In the same sale the California Sales and Pedigree Company also sold 27 head of grade Holsteins for Mr. Shaw at an average of $100.

Fifteen granddaughters of Prince Gelsche Walker and Aralia De Kol, and 20 good cows and heifers bred to a 34-pound sire ought to be attraction enough for one sale of registered Holsteins, but they are only a part of the good ones that will be sold at auction on May 22 for Stalder Brothers by California Breeders' Sales and Pedigree Company. In the same sale Stalder Brothers will sell 20 grade Holsteins and Jersey heifers and 16 head of registered Percheron stallions, mares and colts.

Jersey Breeders will be offered a rare chance to buy some of the greatest registered animals in the West on May 17 when C. G. McFarland's Willowwood Herd will be dispersed at public auction by California Breeders' Sales and Pedigree Co. The herd consists of 60 head of cows, heifers and young bulls. Thirteen of the cows have average records of 516 pounds butter in one year, all in Register of Merit, and most of the heifers in the herd are out of these cows and by richly bred sires.

E. A. Clausen, well known San Francisco attorney, is breaking into the middle of the limelight with his herd of registered Holstein-Friesians. At this writing one of his cows on official test is practically sure of making above 33 pounds butter in seven days, and with a very fair chance of a record well above that figure. She is bred to high production as she is a daughter of Changeling Butter Boy and is a three-quarter sister to Changeling Tidy Abbekerk Wayne, the great cow that recently made 44.42 pounds butter in seven days in Dr. Work's herd in Colorado.

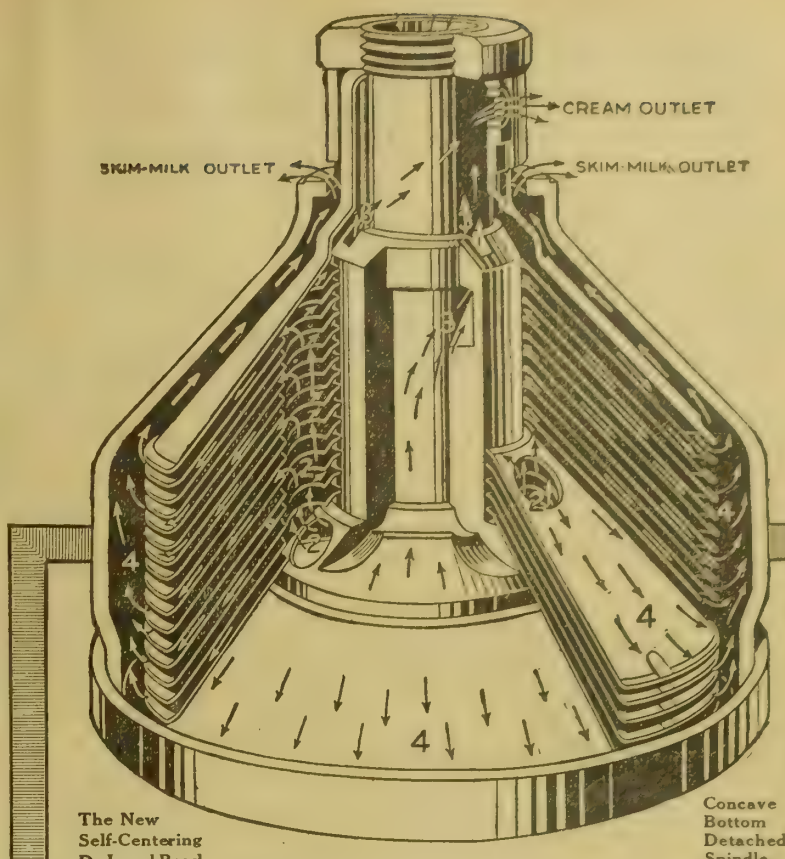
Kenneth W. Abbott, Milpitas, continues to take long steps forward in his constructive development of a high class herd of registered Holstein-Friesians. The latest achievement in his herd is the seven-day official records of the junior four-year-old Mabel Haskins Colantha Girl, who made 578.6 pounds milk and 33.70 pounds butter. She is a daughter of Mabel Haskins of San Jose, 32.77 pounds butter in seven days as a junior four-year-old, this record also having been made under Mr. Abbott's ownership. This latest record is the state record in class, and also makes a combination of the highest record dam and daughter yet developed in California.

R. C. Sturgeon, on his ranch west of Tulare is building up a stock farm, starting in with Holstein-Friesian cattle and Duroc-Jersey hogs. Among his sows is a pure bred specimen purchased from C. A. Hoover of Oregon, another young sow bought from Wilde & Sons of Genoa, Nebraska, the heaviest winner at the National Swine Show at Omaha. One of Mr. Sturgeon's gilts took second prize in her class at the last state fair, and first prize at Fresno and Hanford. Mr. Sturgeon writes: "I have just received a boar pig from H. S. Fain at Emmetsburg, Iowa. He is sired by Cherry Chief's Model and his dam is one of the greatest brood sows in Iowa or the West and is one of the very few sows left sired by Golden Model the 2nd, the foundations of the Golden Models."

Bridgford Co., Knightsen, is doing wonderful work in official testing of registered Holstein-Friesians when it is taken into consideration that many of the cows and heifers are not yet acclimated. Among recent records made we find the following seven-day official records: Ormsby Mechthilde Pietertje, 581 pounds milk and 31.70 pounds butter; Miss Pontiac Nudine of Springvale, 622.1 pounds milk and 30.03 pounds butter; Mercedes Inka Hengerveld, 640.5 pounds milk and 28.20 pounds butter; Pauline Soldene De Kol 3d, a senior three-year-old, 449.6 pounds milk and 27.78 pounds butter; Adirondac Wietske Dairy Maid, a four-year-old with second calf, 601 pounds milk and 27.73 pounds butter; Oakvale Jennie Korndyke, 627.5 pounds milk and 27.04 pounds butter; Panje Hengerveld De Kol, 509.6 pounds milk and 26.76 pounds butter; Upland Zeffie Wayne, a four-year-old with second calf, 586.3 pounds milk and 25.78 pounds butter and 2888 pounds milk and 105.52 pounds milk in 30 days with best day's milk 109 pounds; Rilla Canary, 586.4 pounds milk and 24.56 pounds butter; Miss Korndyke Mercedes, 522.5 pounds milk and 24.56 pounds butter; Countess Katie Hengerveld, a senior three-year-old, 464.30 pounds milk and 22.59 pounds butter; Pauline De Kol Pledge 2nd, a senior two-year-old, 443 pounds milk and 19 pounds butter, and Bos Antonia Cornucopia, a junior two-year-old, 445.8 pounds milk and 17.10 pounds butter. In summarizing these records an outstanding feature is the unusually high milk records in connection with the high butter records, a combination that is being constantly sought after in the best constructive breeding operations.

The Henderson Company, Jay Dutter, manager, announces "The sale of a fine young herd sire and three heifers, Holstein-Friesians, to Geo. Carr. Mr. Carr has shown splendid judgment in the selection of his foundation animals, the bull sired by King of the Black and Whites, who promises to be one of the greatest bulls of the breed, being a son of King Colantha Clothilde, the great son of Colanthat Johanna Lad. This young bull, Manteca King of the Blacks and Whites, is a very fine individual whose dam at two years made 17.84 pounds butter in seven days and 331 pounds milk. She is a daughter of Belle Segis, the great daughter of King Segis (one of the greatest, if not the greatest bull of his day), she with a record of 31.87 pounds butter in seven days. Manteca's mother, while she was a wonder at two years, promises to be much greater. She was sired by the same sire as King of the Black and Whites. This line of breeding has produced wonderful results, the 13 nearest dams of this young bull averaging 30 pounds of butter in seven days, including some of the greatest cows in the world. The females selected to breed to the young sire were: America Pontiac Jewel, sire King Pontiac Jewel, and Trientje Pontiac Plum, and Pearl Pietertje Segis 2nd, sire King of the Pontiacs Plum, all granddaughters of King of the Pontiacs."

Henderson Company also announce "A. Beffa, A. A. Quackenbush and A. R. Strother have purchased each a young herd sire, whose sire is Supreme Glista Pietje, whose dam, Glista Eglantine, a 32-pound cow, was sired by Prince Ybma Spofford 6th, the bull who has the greatest percentage of 30-pound daughters of any bull living or dead. He was owned by Cornell University. He sired only 11 daughters before his death, eight of which are living. Six of the eight have exceeded 30 pounds of butter in seven days. Supreme Glista Pietje was bred to a few cows in New York before we purchased him, and at recent sales these animals, all yearlings or under, have brought from $700 to $1500."



The New Self-Centering De Laval Bowl

Concave Bottom Detached Spindle

The Supremacy of the NEW DE LAVAL

THERE may be some question as to who makes the best wagon or the best plow or the best watch, but when it comes to cream separators the supremacy of the De Laval is acknowledged at once by every fair minded and impartial man who is familiar with the cream separator situation.

Thousands and thousands of tests, the world over, have proven that the De Laval skims the cleanest.

The construction of the New De Laval keeps it in a class by itself.

It outlasts and outwears all other makes by far, and can be run with much less cost for repairs.

The world-wide De Laval organization, with agents and representatives in almost every locality where cows are milked, ready to serve you, insures that the buyer of a De Laval will get quick and valuable service when he needs it.

More De Lavals are sold every year than all other makes combined.

The New De Laval has greater capacity than the 1916 style, is simpler in construction, has fewer and interchangeable discs, is easier to wash, and the skimming efficiency is even greater.

Each New De Laval is equipped with a Bell Speed Indicator.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

New Catalog will be mailed upon request

DE LAVAL DAIRY SUPPLY COMPANY

Barley Beards—Tuberculosis

I have a cow that has three hard lumps on the neck just back of the jaw and in a line directly below the ear. It all started about three months ago with a large swelling along the jaw and under the tongue which interfered with her eating. I fed her soft feed and applied a mustard ointment until the swelling went down, leaving the three lumps about the size of half an apple. She eats and drinks well now and is not going down in flesh or milk. I also have another cow that has a hard lump under the jaw well back toward the neck. Please tell me what it is and what to do for it.—Subscriber, Madera.

I have a cow that on exertion seems to have difficulty in breathing, sticks out her tongue and coughs violently, has a foul breath and occasionally a small swelling appears on the side of the neck just back of the jaw which festers and breaks. Please give treatment.—Subscriber, Lemoore.

Kindly tell if there is any remedy for my milch cow that has gotten a fox tail or barley beard into her throat. Must I simply grease the throat where the foreign substance seems to be working and wait its coming out or can I by outward or inward applications cure it or give relief to the cow that coughs quite badly with the malady?—Subscriber, El Centro.

Probably it is tuberculosis in each case. The one having two cows with the swellings makes me think that at least in that case it is tuberculosis. Do not be too much alarmed about it because the swellings being where they are there is less danger of there being others where it would affect the milk or meat. If in either case the trouble is due to barley beards working through the tissues there is but one remedy: That is to open the cavity and wash it out thoroughly every day with some good antiseptic solution until healed. It would be better to call in the nearest veterinarian and have him test the whole herd for tuberculosis and take his advice about it, or if you have a large herd it might be well to report it to the state veterinarian at Sacramento and he may think it best to send some one to look after it at the expense of the state.

SPECIAL PRIZES

The Holstein-Friesian Association of America announces its special prizes for the season of 1917. At the national dairy show it will award $1500 in cash prizes. Practically every state fair will also receive attention from the association. At the California state fair at Sacramento the association award will be 15 per cent cash on general classification; in the five-day butterfat contest a trophy or silver cup to the first prize winner for a registered Holstein; a trophy or silver cup will also be awarded at the Butte County Spring Exposition at Chico for the best herd of registered Holstein-Friesian cattle; at the Arizona state fair 20 per cent cash will be paid on general classification.

THE SHORTHORN IN AMERICA

The April 1 number of "The Shorthorn in America," the quarterly publication issued by the American Shorthorn Breeders' Association, judging from the character of the matter and the illustrations, must be regarded as the most useful one yet issued, though they have all been of a high order—a distinct compliment to the Shorthorn interests.

KENDALL'S SPAVIN TREATMENT

Known for 40 Years as Kendall's Spavin Cure

A New Name But the Same Old Reliable Remedy

FARMERS and horsemen everywhere will be glad to know that this change is in the *name only*—that there is no change whatever in the famous old-time formula that has rendered such remarkable service in horse ailments—Bone Spavin, Ringbone, Splint, Curb, Sprains and Lameness—by the counter-irritant method.

Whether you get Kendall's under the old label or the new, the quality and efficiency is the *same* old reliable—with a 40-year-old reputation.

Get it of your druggist—$1.00 per bottle—six for $5.00—and ask for book "Treatise on the Horse"—or write

The Imperial Valley Pig Club Contest

THERE is a lesson for grown farmers in the fact that 47 young farmers toiled unsparingly for 105 days feeding pigs until they were fat hogs, then hauled them 20 miles on a hot day to the city of Brawley, where they were placed in the whitewashed pens along the main street and were there weighed, judged, and later auctioned off. This fact also proves without a doubt that "Pig Clubs" have come to stay in California and demonstrates that there is considerable profit in fattening hogs, for not one of the youngsters raised hogs at a loss, at present prices.

The pig clubs in this valley were organized by different high schools in five cities of the valley, under the auspices of the Imperial County farm bureau, and the United States department of agriculture. Young folks from 13 to 18 years of age were eligible to enter as contestants. Each started with three pigs of known age and weight at the beginning of the contest, December 9, 1916, and finished with two at the close, March 24, 1917. Each contestant alone fed his pigs and kept accurate records of all feeds given, at prices prevailing during the winter, and were standard over the valley. Even the time in caring for the pigs was included in the cost, at the rate of 15 cents per hour. The pigs at the start were valued at eight and one-half cents per pound. They were weighed at the start and at such times as designated by the judges.

Imperial Valley Pig Club Contest
On the streets of Brawley the show was made. Photo and article by C. P. Short.

At the end of the contest there were 47 out of the 53 who started, that finished. All of the principal breeds of hogs were represented, as well as numerous crosses. The results obtained differed in many ways, and a variety of feeds and rations were fed.

At the end of the contest, on the invitation of the Brawley chamber of commerce, the hogs were hauled to that city for final judging, awarding of prizes, exhibition, and sale, by auction of the individual pens of hogs. It was interesting that the boys and girls hauled their hogs an average of 20 miles, and that in several cases, instead of a shrinkage, an actual gain was made. The great amount of interest that was shown by the community was evidenced by the large list of prizes offered, and the fact that 1200 people turned out to see the hogs on "Pig Day".

The hogs were judged on the following basis: Value of stock judged as fat hogs, 40 per cent; profit made, 50 per cent; essay on method of feeding, 5 per cent; records of feeding, 5 per cent. The 47 who finished were distributed as follows: Brawley 15, Calexico 7, El Centro 10, Imperial 6, Holtville 12.

Howard Farnsworth was the winner in El Centro, with two Durocs; Eldridge Moores was a winner in Imperial with two Chester-White boars; Joseph Guiotti of Holtville fed two Durocs at a cost of $27.24, which at the auction sold for $70.85 at a weight of 465 pounds. The two hogs made a gain of 349 pounds, and made an actual net profit of $37.02. These hogs brought a pound rate of 15.25 cents.

In the Brawley district many notable gains were made. Don Weaver, winner of a $50 cash prize, fed two pigs weighing 190 pounds at the start, 450 gallons of skim milk, 266 pounds rolled milo, 492 pounds head milo, and seven pounds Indian corn, at a cost of $20.84. At the close of the contest these hogs weighed 593 pounds, and sold at $13.35 cents, making a gain of 403 pounds, and a profit of $42.18 net.

Peter Schartz, winner of a trip to the state farm school at Davis, fed 260 gallons skim milk, 314 pounds rolled milo, 285 pounds head milo, six pounds tankage, and 25 pounds Indian corn, to his two pigs, which weighed at the start 82 pounds. These two Chester Whites at a feed cost of $16.82 made a weight of 431 pounds, or average gain of 3.3 pounds per day. They sold at 15.08 cents, and made a net profit of $40.14. The average price paid by the packers at the auction was only 13.30 cents, and the highest was 18.25 cents.

Results such as these are remarkable and were not attained by any wonderful or remarkable method of feeding, but instead, by feeding the best common feeds carefully. The pigs were not fed sparingly, but forced along. The fact also should be remembered that the best gains and the best profits were made from good stock; not all pure breds, but good grade hogs.

And these boys and girls did have an incentive not only for the profit that their individual hogs were making, but also for the distinction of winning. The town merchants backed the contest royally by offering prizes. In Brawley alone there was $150 in cash prizes, three pure bred gilts, and numerous other prizes, such as clothes, lumber, etc.

One boy started to feed his pigs at the same time his father started to feed a pen of pigs the same size. The man sold his hogs a few days before the close of the pig contest, averaging in weight only 100 pounds. The son's hogs averaged 206 pounds. Maybe this is an extreme case, and though you do better than this man, can you beat his boy who fattened 40-pound pigs to 206-pound hogs in 105 days? There is no reason why you cannot.

SWINE DAY

May 29 to June 1 inclusive will be Farmers' Week at the university farm. Wednesday, May 30, will be Swine Day. Hundreds of farmers will be at the university farm during this week to attend the program, meetings, etc Practically every live stock organization in the state will hold a meeting at the farm during this week, and there will be a two days' Holstein sale.

The board of directors of the California Swine Breeders' Association considers this an excellent time to hold an auction sale for hogs. This association finds that much of the most vital work that it might do remains undone from lack of funds, and has decided to hold an auction sale for the purpose of increasing its working capital. The plan is as follows:

Members are asked to send a gilt or sow, age eight months to three years, to this sale, paying the shipping expenses to Davis and all sale expenses.

Kill Lice This Way

With one hand stroke the hair the wrong way, with the other sift in Dr. Hess Instant Louse Killer. Rub well into the skin. Try it and see how easily you can rid your horses, cattle and calves of lice. You'll find

Dr. Hess Instant Louse Killer

an excellent thing in the poultry yard. Sprinkle freely in nests, on roosts, about pens, yards, houses, run-ways. Don't fail to put it into the dust bath. That's the easy way. Fowls and chicks will work it all through their feathers—no guilty louse escapes. It comes in handy sifting-top cans.

1 lb. 25c; 3 lbs. 60c (except in Canada)

Wanted to hear from owner of farm or unimproved land for sale. O. K. Hawley, Baldwin, Wis.

GARDEN NOTES

Continued from Page 433

paratively costless spray or dusting on the start may be much more effective than more stringent measures a few days later.

And in irrigation of the garden, keep in mind that a light sprinkling with the nozzle is often mistaken for irrigation. Wetting of the surface may not reach to the little rootlets but only crust the surface so as to do more harm than no irrigation at all.

The application of water in a furrow alongside the little plants is much more economical than sprinkling. If sprinkling is done do not apply at midday when the sun may scald.

Many claim they cannot raise a garden because they do not have water under pressure. We have seen in the Imperial Valley magnificent gardens where the irrigation was all done with the use of water from the ditch where light wooden gates were so arranged that every time the water was let into the settling pool for domestic or barn use a portion of the stream was diverted and practically without attendance the plants were perfectly irrigated.

Do not let the water touch the tops of young plants if possible to irrigate without. It may cause scald or induce fungus growth, damping off, or other troubles. The great melon and lettuce fields of the Imperial have the plants set on the edge of ridges just above the furrow where the water is run.

After irrigation rake or cultivate lightly. The wheel hoe is perhaps one of the most economical appliances in the garden or for small field crops. Where this is used finish with small hand hoe and fingers, pulling the weeds from around the young plants.

If choice is permitted choose the sandy strip of the ranch for the garden. It is far easier to cultivate than the sticky, gumbo-type of soil. It is almost impossible to use too much well-rotted manure in the garden. In its absence use commercial fertilizer. Coarse manure applied over the surface aids in retaining moisture. If the soil is heavy use freely of lime to offset any acid. If using burnt lime, crushed, use 1000 pounds per acre, if air-slaked twice that or perhaps 1500 pounds per acre. Complete fertilizer may be applied at the rate of one-half ton per acre.

It takes sun to make young plants grow. If the garden is an intercrop in the orchard and the trees are large enough so as to shade to any extent be sure the rows run north and south so as to get full effect of the sun for part of the day.

PONY WINNERS RECEIVE THEIR PONIES

The three Shetland ponies given away by California Cultivator March 24 were awarded to the following:

Earl McAllister, Kern County.

Torance G. Spike Jr., Fresno County.

Verna Cole, Ventura County.

Earl McAllister and Verna Cole, who have received their ponies, are delighted with them, and ask the Cultivator to publish the following:

Bakersfield, April 1, 1917.

Dear Pony Man.

I want to thank my many friends who helped me in the California Cultivator contest as I won first prize, "Sparkle" and her pretty outfit. I have received them and I am well pleased.

EARL McALLISTER.

Sespe, Cal., March 31, 1917.

Pony Man, California Cultivator.

Dear Sir: I received "Lightfoot" and his outfit and he is sure a dandy. I didn't expect to get such a fine outfit. And many, many thanks for him and his outfit. I am going to have my picture taken as soon as possible and will send you one. Thanking you again very kindly, I am yours truly,

VERNA COLE.

The pony awarded to Torance G. Spike Jr. is en route.

Household Department

THE GATHERING PLACE

Life changes all our thoughts of heaven;
At first we think of streets of gold,
Of gates of pearl and dazzling light,
Of shining wings and robes of white
And things all strange to mortal sight.
But in the afterward of years
It is a more familiar place:
A home unhurt by sighs or tears,
Where waiteth many a well-known face.
With passing months it comes more near,
It grows more real day by day;
Not strange nor cold, but very dear—
The glad homeland not far away,
Where none are sick, or poor, or lone,
The place where we shall find our own.
And as we think of all we knew
Who there have met to part no more,
Our longing hearts desire home, too,
With all the strife and trouble o'er.
—Robert Browning.

HOW THEY SAVED THE HOME

"I DON'T see," said Mrs. Grant, "how we're ever going to keep the place, to say nothing of getting a living, now your father's gone."

"I don't see," answered her 16-year-old daughter Leta, who sat by the window sewing, "how we're going to get along without father in any way."

The family had come to California a few years before and had bought a small place, setting out the greater part to apples. Two acres in front contained a "mixed" orchard, various kinds of fruit planted for the family use and pleasure. Several rows of berries of different kinds, and currants, asparagus, and rhubarb, proved that the family liked variety, and that Mr. Grant believed in growing all he could to save buying. A good garden of various vegetables was well started, so they would not starve for the present. But clothes and incidentals would need cash, to say nothing of the interest that would come due next spring. The eggs from their hundred hens bought their simple groceries, besides the necessary feed, and they had a good cow, that kept them in milk and butter most of the year.

The immediate problem was therefore simple, but the necessity of looking ahead kept Mrs. Grant awake nights. She did not want to lose the home—they would be in worse case than ever then.

"Leta," she said one morning, "we must use less cream, and make more butter to sell. And I'm going to buy a hundred incubator chicks, besides setting every hen that gets broody, so we'll have more eggs to sell next year."

"We might raise some ducks or turkeys," suggested Leta.

"I don't like ducks," answered her mother. "They eat too much. But we might try some turkeys. They could have the pasture lot to run in, and they bring a good price in the fall."

The next month was a busy one, but the weather was favorable, and they had good luck with their young poultry. Then one morning Leta came in with a few ripe berries in her hand.

"There are going to be loads of berries, mother," she said. "They are ripening fast, too."

"Well, that's good," said her mother. "There ought to be a good many to sell. But we have no way to deliver them."

"Perhaps we could get Mr. Lummis to carry them with his."

"We can't bother him all the time No, we've got to think up some other way.

"Let's put out a sign, mother, said Leta; 'Fresh berries for sale.' Lots of people don't have berries, and such numbers of automobiles pass here with folks from town. They might like some, too."

"I suppose we might try it," said Mrs. Grant doubtfully, "but I don't count much on signs."

"Let's make it different, mother, from the dirty old signs we see generally. Let's make a nice one, and put the word 'today' on, and change it often."

So Mrs. Grant made a neat signboard, and nailed it to the gate post. Leta, who had some skill in lettering, made a pasteboard sign which was tacked to the board. This read "Fresh berries today." No attention was paid to the sign the first day, and even Leta felt somewhat discouraged, but the day after a wagon stopped, and the driver bought two baskets of loganberries. There was scarcely a day after this while the berries lasted that they did not have one or more calls. Some people bought regularly, while one or two customers wanted a whole case for canning. Any day there were berries left over Mrs. Grant would can or preserve them the next day, so as never to sell any but fresh fruit, and never waste any.

Soon the garden began to ripen more vegetables than they could use, and they added "vegetables" to their "for sale" sign. It appeared that vegetables fresh from the garden made as true an appeal as the berries, not only to city folks, but also to those ranchers who preferred to confine their attention to their main crop, and not "bother" with vegetables.

Several peach and cherry trees began to bear a fair crop this year, and for the early peaches and some extra fine cherries they found a ready sale. Everything they did not need to eat or did not sell, they put up in small jars, neatly labelled, and the close of the summer found them with about 300 jars of various kinds of fruit and vegetables, besides an order they had filled for one of their automobile customers, a business woman in the city. In addition to the fruit, they had canned tomatoes and beans, and had put by vegetables enough to last them until the next summer. Winter cabbage and some other vegetables were set out, the young pullets began to lay promptly, and the spring calf had paid for what little butcher's meat they used.

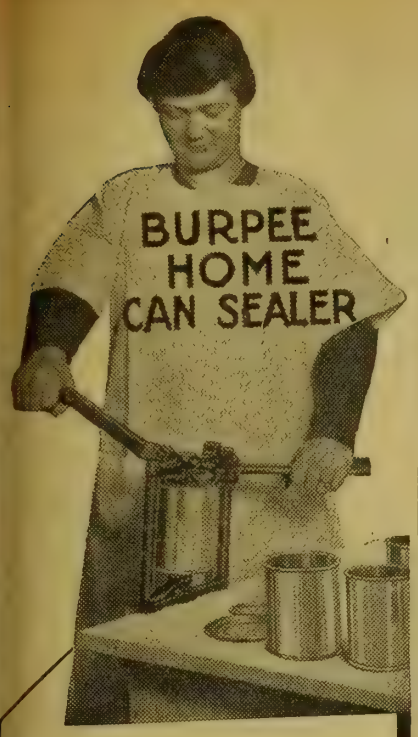
The first of December Mrs. Grant opened the sealed box into which they had been dropping change all summer, and she and Leta counted out their cash savings—$31.40.

"Pretty good, I call it," Mrs. Grant said, as she contemplated the neat piles, "especially when we had to hire the cultivating done. Well, I'll put $20 in the bank toward the interest, and we must make the rest do for what clothes we need this winter. Lucky father laid in a good supply of wood last spring. I don't think we shall need any more until next spring. But we need a good deal more money than that. And what are we going to do this winter? I could do plain sewing, but there's not much in it for so much hard work. I might bake bread. They tell me there is always a good sale for home-made bread in town, but I don't know how it would be out here. I might try."

And try she did, for Mrs. Grant was not one to let the grass grow under her feet. The sign now read "Fresh bread Tuesdays and Thursdays" and "Canned fruits." Leta had been well instructed in plain cooking, and was a great help to her mother in the kitchen as well as in the garden. Mrs. Grant could make extra good bread, and soon found that she could sell all she had time to make. As the winter passed, she added brown bread, gingerbread, cookies, and doughnuts, on certain days. Her bank account grew slowly but steadily during the winter. She retained old customers and made new ones, and as spring approached she found herself with a new problem on her hands. The customers who had become used to the good home cooking did not want it to stop, but two pairs of hands could not keep up with the steady baking required as well as do the garden work and attend to the chickens and cow. Now chickens must be hatched, garden must be planted, and berries would soon be ripe. Should she let one branch of her business go, and if so, which?

Just then luck stepped in, as luck so often seems to do, and helped her to a solution. Some cousins, a brother and sister, living in the East, wrote her that the young man had been ordered to go West and live outdoors, and he and his sister, who were alone in the world, wanted some chance to earn a living in not too strenuous a way. Could Mrs. Grant suggest anything? Mrs. Grant wrote back promptly that if they were willing to give her the help she needed, they were welcome to a home with her and her daughter as long as they cared to stay.

The offer was accepted; a tent for the young man soon appeared in the orchard, and two more willing hands made the summer's work fly. There was of course more fruit than the past year, but more customers, too, so



CAN YOUR OWN PRODUCTS

Don't throw your surplus fruits and vegetables to the hogs. Turn them into profit. Can them with a BURPEE HOME CAN SEALER. Then sell them at top prices, or keep them for your own use.

No Solder Needed!

No solder nor acid are required with the BURPEE HOME CAN SEALER. Séals sanitary cans absolutely airtight. So simple a child can use it. So cheap that no home can afford to be without it. It's the greatest canning device of the age. Clamps to any kitchen table. Satisfaction absolutely guaranteed or money back.

Send for Free Book

It tells all about the simple, easy method of canning fruits, vegetables and meats. A book of recipes compiled with the assistance of U. S. Dept. of Agriculture is sent free with each sealer.

Write for full information.

there was left less fruit to put up. The interest had been paid promptly, and something had been put in the bank toward paying off the principal, and Mrs. Grant and her daughter looked forward to buying a horse another year if everything went well. But they were satisfied that their signboard paid, with solid work behind to back it up. With continued good health, the home would certainly be paid for in a few years, and best of all, mother and daughter were together in the home the father had begun for them.—Farm, Stock and Home.

HOUSEHOLD QUERIES

Milo Recipes

Please give recipes for preparing ground milo or milo meal for the table. —Subscriber, Holtville.

Prof. M. E. Jaffa of the University of California, Berkeley, writes: "We have not made any experiments along this line but such experiments have been made elsewhere and recipes offered for the use of ground sorghums and small corns, such as the Egyptian corn, milo and kaoliang."

Prof. Jaffa sends copy of Bulletin 158, "Proso (millet) and Kaolaing as Table Foods," published by the agricultural experiment station, Brookings, South Dakota, in which we note: "Meal made from the grain sorghums ground locally is not infrequently used in the making of batter cakes and similar articles of food. . . . There seems little reason why, when properly milled, it should not be used in much the same manner as corn meal." We would advise the inquirer to write United States Department of Agriculture, Washington, D. C., and ask for such bulletins as are available on the subject.

Hotel Hot Cakes

Two-thirds kafir flour, one-third wheat flour. Three teaspoons baking powder to one quart of dry flour; four eggs, a little salt and sugar; sufficient milk to make three to four quarts batter. Add one half cup maple syrup. If the batter stands over night it is better.

Kafir Muffins

Two cups kafir flour; one cup wheat flour; one tablespoon sugar; one level teaspoon salt; two eggs beaten separately; one piece butter size of large walnut; two heaping teaspoons baking powder; add one pint sour milk in which one-fourth level teaspoon of baking soda has been dissolved. Batter must be thin. Most cooks on first trial make it too thick.

Kafir popped the same as popcorn has a delicious flavor. It is sweeter than popcorn, softer, and does not have the hard center often found in popped popcorn. It merits general use on popcorn stands and in candy stores.

Feterita Brown Bread (four loaves)

Feterita meal, 1½ half cups, rye meal, one cup, molasses, one cup, salt, one teaspoon, graham flour, 1½ cups, sour milk, 2½ cups, soda, one heaping teaspoon, chopped raisins, one cup.

Mix well, fill one-pound baking powder cans two-thirds full with batter. Put covers on cans and steam four hours. This may be done in a large kettle. The water should not be too deep—if it reaches one-half the height of the can it will be enough.

Golden Feterita Bread

Feterita meal, three-quarters cup, sugar, one-quarter cup, salt, half teaspoon, egg, one, flour, one and a quarter cups, baking powder, five level teaspoons, milk, one cup, butter (melted) one or two teaspoons.

Mix and sift dry ingredients. Add milk, eggs well beaten and butter. Bake in shallow buttered pans in hot oven 20 minutes.

TROUBLE THAT NEVER CAME

Oh, I worry over this thing and I worry over that,
But I notice when the atmosphere has cleared
That the bad luck I had looked for didn't come and knock me flat,
And I didn't have the trouble that I feared.
Oh, I like to start the morning with an apprehensive sigh,
For I find a bit of worry to my taste.
But I cannot help a-thinking as the years go speeding by
That an awful lot of worry goes to waste.—Pittsburg Post.

When writing advertisers, mention the Cultivator.

From Shell to Griddle

Written for California Cultivator By Jean A. Koethen

A SUCCESSFUL poultryman never allows a chicken to die on his place." This is the motto of George W. Masterson of Duarte, poultry judge and fancier on the side, orange grower by profession. "It doesn't matter what you do with the chicken to beat him to it," says Mr. Masterson, "but beat him somehow and don't let him die."

Pretty good advice for the beginner, isn't it? Indeed, I suspect we are all too prone to consider a sick chick as good as dead and not worth fussing with. Better than fussing with sick chicks, however, is the care that never lets them get sick, if it has to sit up all night to keep them warm.

Being a fancier and aiming at quality rather than numbers, Mr. Masterson raises his chicks in small flocks. Sometimes they are brooded by a mother hen, sometimes in a "toasty" warm south front brooder house heated by brooder stoves, one for each brood, and this spring he plans to try capons as mothers, keeping the chicks the first three weeks in the brooder house, then transferring them to the care of the capon. The morning I was there all the chicks were in the brooder house, a snug building about 12 x 16, divided by low wire fences into four compartments and with the south side all glass. The chicks in the first compartment were recently from the incubator and were revelling in the warmth of their brooder stove and of the sun which streamed in at the south window. Those in the fourth compartment were perhaps six weeks old and no longer required artificial heat. Not over 25 chicks were in any one compartment, and the number in the fourth was much less than this.

All chicks are hatched by incubator. When hatching time comes the eggs are moistened with warm water, and the incubator is closed till the hatch is over. The chicks rest quietly in the nursery the first night after they are hatched, and the second evening, about 48 hours after the first chick breaks the shell, are removed to the brooder or to the coop containing the hen that is to mother them. No feed is given till the next morning when the chicks receive a feeding of commercial chick feed. Then they are put back into the brooder to warm up. A ring of inch mesh poultry wire 12 inches high keeps them close to the brooder stove the first few days. As they grow older this is removed and the chicks given leave to wander over the whole compartment.

No one method of feeding is followed exclusively, but the following is the one which has been found most satisfactory:

The first five days nothing is fed but a good grade of commercial chick feed. At the end of the fifth day a hopper of plain bran is added. This is left before the chicks. At the end of the eighth day feedmeal, beefscrap and charcoal are added to the bran according to the following formula: Bran two parts, feed meal two parts, beef scrap one part, charcoal one part. This is kept before them till they are three months old, when they are given a mash composed of 100 pounds laying mash as put up by various dealers and 100 pounds fine ground oats. This makes a splendid growing feed. The pullets are kept on it till they are seven months old, and the cockerels until matured.

When the chicks are three weeks of age the chick feed, which has so far been their only scratch feed, is dropped, and in its place is given a mixture of one part oat groats, two parts wheat and two parts cracked corn. When they are four months old this is changed again to a scratch feed of equal parts cracked corn, whole feed oats, wheat and hulled barley. They are fed liberally on this until matured.

Mr. Masterson is a firm believer in the virtues of buttermilk or clabbered milk for chicks. They receive no water until they are ten days old. When they have been two days in the brooder they are given their first drink, which is buttermilk. A shallow pan six inches in diameter is filled with the milk and a brick laid across to keep the chicks from getting their feet into the milk. After ten days a fountain of fresh water is placed in the pen and the milk given only in the morning. At the end of the fourth week it is discontinued altogether, not because it is no longer beneficial, but because the quantity is limited and it is not so greatly needed after this time. Sweet milk for chicks Mr. Masterson does not believe in, nor does he recommend draining off the whey and feeding the sour milk in the form of cottage cheese.

When the chicks are five weeks old they are ready to roost. Other breeds might take a little more time or a little less, according to rapidity of development, but Rhode Island Reds when properly fed are ready for their first roosts at this age. These roosts are made of laths about three-eighths of an inch apart. The hover is moved onto this slatted platform for a few nights until the chicks have become accustomed to their new roosts, then is removed, and lo and behold! the chicks are roosting. Three weeks later they are transferred to the colony houses where they are to remain till matured.

The following "dont's", which Mr. Masterson commends to beginners, will carry no little weight:

Don't put off doing a little job when you first notice that it needs doing. A stitch in time saves nine.

Don't neglect to feed green feed every day. This is an essential part of the program in a paying poultry plant.

Don't neglect to give fresh water frequently. This is only second in importance to feeding green feed.

Don't neglect the chickens unless you want them to neglect you. If you keep them (properly) they will keep you.

Finally, never let a chick die if you can possibly keep it alive.

COLUMBIAN WYANDOTTES

The average popularity of a variety is usually due, not alone to its merits but more to advertising and sending large entries to the popular shows, etc. The breeders that have taken up Columbian Wyandottes have bred them more for their great beauty and usefulness than from a business standpoint. And all during this time by painstaking methods they have been perfecting them both as to general appearance and profitable qualities until today we feel sure that we really have the twentieth century business fowl, a bird that breeds comparatively true to standard, a fast grower and perpetual layer, laying through storm and cold weather, hardy and gentle, beginning to lay at from four to five months old, hence a source of pleasure and profit. With such a dandy little "queen" to work for some 200 staunch admirers are all working together, hand in hand under the name of the National Columbian Wyandotte Club to see that she is not robbed of what rightfully belongs to her, popularity.—National Columbian Wyandotte Club.

BEET PULP FOR POULTRY

J. R. Henderson of Covina writes: "I saw an inquiry in Cultivator last week about the value of beet pulp for poultry, and I would add to the reply given that Mr. Harrison of Pasadena, the well known breeder of Rhode Island Reds, uses it in his dry mash and seems to think highly of it. I myself have used it in a wet mash for fowls and have tried it out as a food for geese. The fowls liked it very well, and always cleaned it all up, but the geese would have nothing whatever to say to it after the first day or two.

"If any readers can offer suggestions for protecting poultry from thieves we shall be very glad to hear from them in this part of the country."

DECEMBER LAYERS

Mr. and Mrs. John McKeig of Alta Loma report that 250 pullets hatched April 28, 1916, of Doctor Blackshaw's White Leghorn strain laid in December, 1916, 4187 eggs, an average of 16.75 per pullet.

Madera County supervisors are asked to provide fencing necessary for rabbit drives.

HAY

Under date of April 7 Scott, Magner & Miller say:

Receipts past week 1711 tons; last week 2063 tons. Receipts past two weeks quite heavy, much more than for several weeks past.

All holders understand the situation is acute and stocks in country lower than were ever known before at this time of the year. Stockmen from Idaho, Montana and other districts east, have been buying through these districts everything available at extreme prices. Several carloads of poor quality have arrived from Oregon during the week but owing to high prices paid this has been held at prices in line with that asked for our California crop. Our market steadily advanced during the week and we believe will go higher.

Choice wheat hay is today selling at $31 per ton, other grades in proportion. Alfalfa is practically nominal.

We quote the average wholesale price of hay in carload lots on today's market as follows, viz:

BOTH BLADES CUT

The Scientifically made Giant Tree Pruner

ABSOLUTELY THE BEST EVER PRODUCED

THIS IS WHY Most tree pruners have one cutting edge. The Giant has TWO, running parallel so you are SURE TO GET A CLEAN CUT EVERY TIME with the grain of the wood PRESSED TOGETHER with tree limb uninjured. THE GIANT TREE PRUNER (made in three sizes) will cut any tree limb that the knives will span and will cut it square off, close up or at any angle. Because of the clean job the wound will heal over much quicker than if torn or split. Each knife made of best tempered steel, castings strong and substantial. California orchardists say it is the best they ever saw. Descriptive circular sent on request.

Twenty-five dollars of the amount the sow brings is to be donated to the California Swine Breeders' Association. The net, after subtracting the above mentioned items, goes to the owner.

JERSEY BREEDERS' ASSOCIATION ORGANIZED AT ORLAND

Written for California Cultivator
By J. M. Roberts

The energetic Jersey breeders of Glenn County have formed a Jersey Breeders' Association at Orland with approximately 50 charter members.

A meeting in charge of J. M. Roberts, field agent in California for the American Jersey Cattle Club, was called on the afternoon of March 17 at Orland. Jersey breeders from all over Northern California were present. Hon. Peter J. Shields of Sacramento gave a splendid address on the history of Jersey cattle and their adaptability to California conditions.

Prof. E. C. Voorhies of the Animal Industry Division of the University of California, also gave an interesting talk on the effect of an organization of breeders on the advertising and selling end of the live stock business. Farm Adviser W. H. Heileman of Glenn County and Deputy State Dairy Inspector Hugh D. Cameron, assured the breeders of their cooperation and congratulated the new organization upon its auspicious start.

The Butte County Spring Exposition was represented at the meeting by Messrs. Eames, Folk and Dencl. Mr. Eames heartily indorsed the movement of the Jersey men and extended an invitation to everyone to come to the big spring fair at Chico, which is to be held in May. Chico's support of the Orland Live Stock Show, to be held next fall, was also promised by the delegation.

N. H. Locke of Lockeford was present. Mr. Locke gave a very interesting talk on the California Jersey, also his reason for being in the Jersey business since 1857.

California Breeders Sales and Pedigree Co.—20 registered Holstein bulls, Chico, May 24, 1917.

California Breeders Sales and Pedigree Co.—180 registered Holsteins, University Farm, Davis, first week in June. Date to be announced later.

Succulence greatly increases the efficiency of the cow's ration; consequently root crops or corn ensilage should form a predominating factor in making up her winter rations. The benefit from root crops and corn ensilage comes mainly through the favorable effect on the cow's system.

The record of the cost of feed is just as important as the record of milk and butterfat produced. Frequently the cow with the big feed bill is the cow that makes the most profit.

Cows Fail to Get With Calf

No Reason to Slaughter

Hundreds of perfectly good cows go to the butcher's block every year because of failure to get with calf. There the valuable full-blood brings just as few cents per pound on the hoof as the orneriest scrub.

Most of this slaughter is unnecessary. The apparent barrenness can be prevented—the cows saved to continually produce good profits in healthy calves and milk. But the longer they are allowed to go without getting with calf, the less chance there is of successful breeding.

Barrenness or Sterility, like Abortion, Retention of After-birth and Premature Birth, is nearly always caused by infection of the reproductive organs by the germs of Contagious Abortion, etc. Unless this infection is promptly overcome by the use of a powerful but safe antiseptic, it may permanently affect the reproductive organs so that the cow will continually fail to stick.

Every time a cow drops a calf—whether alive or dead—by premature birth or aborting,, whether the after-birth is retained or not, her reproductive organs should be flushed out. At this time the disinfecting solution can be injected clear up into the uterus, infection will be prevented and success at the next breeding made reasonably certain. Heifers or cows that fail to get with calf, will usually "stick" after a short treatment of this kind.

This treatment can only be successful through the use of a safe, non-irritating disinfectant with great germicidal and antiseptic qualities. Used as a douche, the powerful germicide Bacili-Kil (commonly called B-K) dissolves the slimy albuminous matter in uterus, destroys the disease germs, brings the after-birth, kills the bad odors, heals the tissues, leaves everything in a clean, natural, healthy condition.

B-K is scientifically correct for this work. It does not irritate, but is soothing and healing to the torn membranes and does not cause straining. Other germicides such as carbolic acid, cresol, iodine, etc., tend to irritate, do not dissolve the slimy albumins, but tend to coagulate or thicken them, thereby preventing destruction of the germs and cleansing of the tissues.

The remarkable germ-killing strength of B-K is plainly marked and guaranteed on every package. B-K contains no poison, acid nor oil. It is safe and clean and easy to use. B-K may be used freely in the drinking water, helping to destroy germs which accumulate in tanks, also helping to disinfect mouths, throats, and digestive tracts.

B-K is handy. You have in one jug ready for use by just mixing with water, your treatment for cows, bulls and calves; also the cleanest, safest and best disinfectant you can possibly have for general use. No special mixing of various ingredients—saves trouble and mistakes, insures promptness, accuracy, convenience and successful results.

Leading breeders throughout the country bear ample testimony to the valuable aid they have received in using B-K in treating barrenness and similar ailments among their cows. One breeder says: "I want B-K for I know that it is doing me good. Cows that have been barren for more than a year getting with calf; two good strong full-time calves and four cows that are due next month that have every appearance of going full time. Had already lost seventeen calves by Abortion and Calf Scours."

B-K is sold by dairy and farm supply houses, druggists, general stores, etc., everywhere. If your dealer does not have it, send us his name.

Write for additional testimony from users, and the reasons why B-K is so uniformly successful in this work. Send for bulletin No. 52, "Contagious Abortion —Prevention and Control." Bulletin No. 136, "How to Save Every Calf."

Boys and Girls Send in Your Names!

WE GIVE AWAY SHETLAND PONIES

This is the Easiest and Best way to get one. Any Reader may send in the name of any boy or girl.

The Best Pet and Playmate any Child Can Have

Wouldn't you like to have us send you a fine pony like this?

Just the Prize Every Boy and Girl Wants Most

How to Get a Shetland Pony

The California Cultivator, the big agricultural and live stock weekly of California, is going to give away some more Shetland ponies, and you might just as well have one as anybody. Send in your name and address today so we can tell you all about it. It costs no money to enter or take part. Already the Pony Man has given away 151 Shetland ponies to boys and girls for doing a little work that you or any boy or girl can easily do during spare time. Many other boys and girls say it is easy, and I believe you will say it is too.

These Shetlands we give away are fine, valuable little horses, all trained for children to ride and drive. Read the letters we are printing and see what the other boys and girls say who have won our prize ponies.

A Shetland pony is the nicest pet and playmate any child can have. They are fine to ride and drive to school for they are perfectly safe and by nature are great pets and very strong, useful animals, too. Many boys and girls who have to walk to school have sent to California Cultivator for a Shetland pony.

The Pony Man had never heard of any of these other boys or girls until they sent him their names and addresses so he could write and tell them how to go ahead.

Three more fine Shetlands and outfits will be given away Thursday, May 31, 1917, to boys and girls who do some work for us that will be easy to do. The sooner you send in your name the sooner you can get started.

Each Pony Is Gentle and Broken to Ride and Drive

These Ponies Are Fine to Ride to School

A PRIZE FOR EVERY BOY AND GIRL

And here is another important point. If you send us your name and address at once you will be entitled to take part in the Extra Prize Awards and you can sure earn a fine camera and gold watch or other valuable prize. You cannot lose, everyone taking part will receive a prize or cash for the work done.

"King," a beautiful young Shetland and pretty outfit consisting of a fine four-wheeled pony runabout and nickel mounted leather pony harness is the first prize, and that is the one you want and you might just as well have "King" as anybody. Send us your name and address right away so you can get started at once and get a pony for yourself. Besides "King" we are going to give away two other fine Shetlands, "Stepper" and "Beauty", and a pretty saddle outfit with each one. As soon as we hear from you we will send you pictures of other boys and girls and the ponies they got and tell you how to go ahead. If you already have a pony and know some other boy and girl who would like to have one, please tell them about these ponies we are going to give away.

DELIGHTED WITH THEIR PONIES

I have already given away 151 Shetland ponies and pony rigs to boys and girls and if you haven't a pony now is your time to get one. You will be just as well pleased as the others. I have not the space here to print all the nice letters the boys and girls have written me, but I will send many more when I hear from you. Some have been offered $200 for their ponies and outfits, and would not accept it, so you see these are valuable prizes we give away.

Rialto, Cal., December 27, 1916.

Pony Man, California Cultivator.

I take pleasure this morning in writing you a few lines for Percy, thanking you for the nice prizes he received. He certainly was delighted with them. If the other contestants were as pleased as Percy they certainly were a happy lot on Christmas morning. Yours truly,

MRS. W. F. FOWLER.

WAS OFFERED $200 FOR HIS PONY AND OUTFIT

Here is a letter from Earl Frederick, who won first prize pony and outfit about a year ago. He was offered $200 for his prize, but would not sell it. "King" and his pretty outfit are just as nice as Earl's pony and outfit. Here is Earl's letter:

"Dear Pony Man: I received 'Bingo' and the buggy and harness which I was fortunate enough to win, and I am well pleased, as it is a better outfit than I really expected. I have been offered $200 for it, but of course it is not for sale. I want to thank you for it and advise any boy who wants a Shetland pony to enter and work and earn one, for it is sure a pleasure to ride or drive a pony like the one I got. I will have my picture taken with the outfit and send you one. Again thanking you, I remain, your friend,

EARL FREDERICK."

Marina, Cal., January 14, 1917.

Dear Pony Man:

I am very much pleased with my watch. It keeps accurate time. I have only had to set the hands once. I feel very well rewarded with it for the little work I did for you. I feel as though I have not done enough for you. I would like to enter any other campaign that you have, so please let me know about it.

Very truly,
THOMAS SAMUELS.

Sacramento, Cal., February 12, 1917.

California Cultivator, Los Angeles.

Dear Sirs—I wish to thank you very much for the way in which you conducted the recent campaign in which I took part. Your paper is very well known throughout the country which makes soliciting much easier and encourages one to work harder. The system you have in keeping the contestants informed as to their standing could not be improved upon.

I worked as hard as I knew how and although I was not fortunate enough to carry off the first prize I am very well satisfied with the second, which at present I would hate very much to part with.

The pony is just great. I am growing more fond of her every day and she is as gentle as a kitten. So far I have been riding her but as she either drives or rides I intend to get a small cart so that I may give some of my interested friends a ride.

Again thanking you for your kind treatment during the contest and dandy pony and saddle I received, I remain Yours very truly,

JACK HENDERSON.

TAUGHT HIS PONY TRICKS

"I am sending you a picture of myself and 'Colonel' and his outfit. I was sure glad to get him, for I think him peaches and cream. He drives fine and I ride him also. He will lie down, shake hands, jump over a stick, stand on his hind legs, and try to do most anything I tell him. He seems to understand what I say. Again thanking you for 'Colonel' and outfit, also those who took the paper, I remain, "ELMER LINDSAY."

WINNERS OF OTHER PONIES RECENTLY GIVEN AWAY

Beulah DeWitt, Ventura County.
Raymond Moyer, Riverside County.
Margaret Rae, San Bernardino County.
Marguerite Rinn, Sacramento County.
Gertrude Fawcett, San Joaquin County.

FISK Non-Skid TIRES

They have the stamina, the strength and the endurance of blooded stock. Our long experience in tire making enables us to build Fisk Tires with a pedigree and get those qualities which stand for real dollar-for-dollar value to the man who buys them. ***Fisk Tires are purebred tires.***

Every user knows it and knows too that there is no greater tire value on the market.

Buy at least one—compare the value you get in Fisk with any other make of tire—thousands of Fisk buyers began to use Fisk by making that dollar-for-dollar comparison, and they are using Fisk today.

"When you pay more than Fisk prices you pay for something that does not exist"—that's something to remember when buying tires.

A special feature of Fisk Tire Value is the policy of Free Service through Fisk Branches in more than 125 principal cities throughout the country. There are Fisk Branches in your State, where your home dealer buys direct and is always sure of promptest attention to your wants. And when the Branch is convenient you can go there any time, *whether you use Fisk Tires or not,* and make use of the only uniform and complete Free Tire Service in the country. There is no charge at any time except for supplies and actual repairs. Take the first opportunity to get acquainted with *Fisk Service,* Fisk Organization, Fisk Methods and Fisk Products.

Time to Re-tire?
(Buy Fisk)

If you do not find a Fisk Branch in the partial list below that is convenient to where you live, write for complete list—there may be one nearer you.

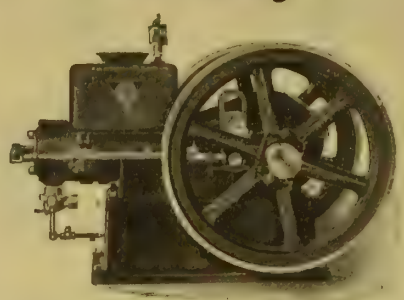
The Best Gas Engine to Buy

ALPHA



WHEN selecting a gas engine, the most important thing is to get a good engine. There is no economy in buying an engine that is going to require frequent repairs and that is likely to balk just at the time you need most to use it.

The wise man considers service, reliability and durability first, and price second. Selected on this basis, the ALPHA is the logical engine to choose, because it is the simplest and most durable in construction and the most reliable in operation. It runs smoothly and powerfully on a minimum consumption of either gasoline or kerosene, and operates on a simple magneto without the use of any batteries.

It is so simple that a woman or a boy can start and operate it, and the sensitive governor, which acts the instant there is the slightest variation in the load, insures steady running without any waste of fuel.

Before you put any money into a gas engine, investigate the ALPHA—and remember that the man who buys the best is never sorry.

"The Old Lines"

EVERYBODY speaks of them as "the old lines," many perhaps without realizing how thoroughly new and up to date are all these **Champion, Deering, McCormick, Milwaukee, Osborne** and **Plano** mowers, rakes and tedders. What really good improvement was ever made in haying machines that did not show itself first on one of these machines? Where can you find mowers, rakes, or tedders that need so little adjustment, so few repairs, or that are so easy to repair when they do need it? Nowhere. These old standard machines, known to farmers for three quarters of a century, can still be depended upon to get in all the hay from any field and to make the work light for the farmer.

When you need a mower, rake, or tedder, see the local dealers who handle the **International Harvester** lines. We can remind you here that our machines have always done good work, but the dealer can show you why they still do it. You will find that the local dealer has just the size and style you need. Buy from him.

California Cultivator

Vol. XLVIII No. 16 LOS ANGELES: April 21, 1917 One Dollar Yearly

Great Opportunity for Bean Producers

California Called Upon to Produce Food as Never Before. Stick to Staples. Beans Offer Great Opportunity. Millions of Sacks Already Produced Should be Doubled This Year. Planting Information.

OVERENTHUSIASTIC people, appreciating the situation confronting the United States and the world, say "Plant everything everywhere", but in planting as well as fighting there is need for keeping cool-headed. Plant intelligently and plant with an idea of continuing with the game until harvest. Hundreds of acres will be planted to crops which will never be harvested with any profit, but let Cultivator readers consider "Why? What? Where? When?"

Beans will give a great supply of food which will in part make up for the shortage of winter wheat which now appears probable. Spring wheat planting will be large but we need more beans.

In planting beans, don't plant Limas on the desert nor Teparies in the ocean. So pardon some of the simplest elementary points in bean culture, for there are many of us who need these elementary lessons.

Variety and Locality

First, as to locality and varieties, let us quote a bit from "Bean Culture in California", written for Cultivator readers by Geo. W. Hendry and given in our issue of May 13, 1915. The principal commercial varieties in this state are Limas, Pinks, Large Whites, Blackeyes, Bayous, Small Whites and Teparies. The Lima is sensitive to frost, demands more or less humidity, and will not stand hot, drying winds. Plant near the ocean. Pinks are grown more or less in all sections of California and will stand a degree of drouth and heat. Large Whites, Sacramento and San Joaquin delta sections, unproductive under heat and drouth. Mexican Reds are fairly successful in interior valleys. Blackeyes, a cow pea and different botanically from the other beans, grown in valleys both interior and nearer the ocean, will stand more heat and drouth than Pinks, used as summer green manure crop. Bayous not grown extensively, mostly near banks of San Joaquin and Sacramento Rivers. Small White will not stand heat and drouth, cool, humid climate necessary to best development, grown in Monterey, San Luis Obispo and Santa Barbara Counties. Teparies developed by the Arizona experiment station, grown for centuries by Indians under hot desert conditions, Rather poorly received in market when first introduced, the past year have sold at long prices. The Mexican Pinto is a new variety which stands drouth, grown most successfully at attitudes of 4500 to 5000 feet.

Soil Preparation

Soil usually preferred by the bean is the loam type, but fairly good success is secured on adobe. Sandy soil may answer. This depends, however, upon the subsoil conditions.

While planting is in the springtime, preparation of the seedbed should begin in the fall. Deep plowing, at least eight inches deep, thorough harrowing and conserving every drop of moisture that has fallen will be a great aid in securing a big crop at lowest cost. If such preparation has not been made, great care in securing a perfect seed bed will now be necessary. Plow deeply and harrow until a perfect dust mulch is secured. If the late plowing is done use sub-surface packer or in some way pack the soil so that it will hold every drop of moisture. After settling the soil go over the field two or three times with the heavy harrow and after the lightest rain harrow again.

Seed Per Acre

This table and some of the other facts following are taken from "Bean Culture" by V. C. Bryant of the state experiment station.

The first column shows pounds of seed to plant per acre where there is a minimum amount of moisture to produce crop, the second when abundant and the last column average.

Characteristic Bean Leaves

The upper narrow pointed leaf is that of the Tepary. The stems are very short. Evaporation reduced to the minimum. Heat and drouth resistance great. Lower leaf of ordinary bean vastly greater evaporating surface.

	Lbs.	Lbs.	Lbs.
Tepary	7	18	10 to 12
Small White	8	20	12 to 15
Blackeyes	12	25	18 to 20
Pinks	15	30	20 to 22
Mexican Red	15	30	20 to 22
Large White	15	30	20 to 22
Lady Washingtons	15	30	20 to 22
Cranberries	18	35	22 to 25
Bayou	20	35	27 to 30
Red Kidney	20	40	30 to 32
Limas	..	..	50 to 60

Planting

Rows 30 to 36 inches. Plants in row six to eight inches. There are regular bean planters or a grain drill may be adapted. If an 11-row grain drill with seven inches between tubes is used fit it by plugging all the cups except the second, sixth and tenth. This spaces rows 28 inches. The depth depends upon soil, as an average, an inch and a half of moist earth over the seed which with deep dust mulch provides for a depth of three inches from the surface. Bear in mind this depends on character and condition of soil.

Time of Planting

In the interior valleys plant the crop at such a time that it will not blossom during the extremely hot summer months. If blossoms appear at this time the hot wind will "blight" them so that the beans will not "set." If beans are planted as late as the last of May or the first of June they will usually bloom late enough to avoid this trouble. The exception is where the Tepary is grown in some of the dryer localities. In this case it is necessary to plant earlier to make use of rainfall. Along the coast and in the delta areas some time during the month of May is usually the best time to plant.

In the interior valleys where irrigation water is available beans can be successfully grown as a second crop. In this case the land should be irrigated and the seedbed thoroughly prepared as outlined above. This work should be rushed so that the beans can be planted by July 1.

Cultivation

Conserve moisture by surface mulch two or three inches deep by an occasional cultivation. Cultivate no deeper than is desirable to have the surface mulch. Deeper cultivation produces excessive drying by exposing the moist soil from below and will also disturb surface roots. Thorough shallow cultivation should be given every two or three weeks until the beans begin to "set".

Irrigation

Beans should receive very little irrigation. Plenty of moisture should be stored within the soil before planting and a surface mulch maintained in order to hold it. Where grown as a second crop, or where the soil dries out before a seedbed is formed a thorough irrigation should be given and the mulch established before planting. It will not be necessary to irrigate the growing crop, except on very light, sandy soil. If irrigation is necessary thoroughly cultivate after. Many fine looking fields fail to set beans because they have been irrigated too much and cultivated too little.

Insects

Bean weevil appears in midsummer and enters the bean while green. They remain within the beans during harvesting and threshing and continue to breed and reproduce within the stored beans. If the beans are planted late the trouble will be somewhat avoided, as the adult insect will have to deposit her eggs elsewhere before the bean pods have developed. Fumigate with carbon bisulphide at the time the beans are stored, and if treated in this manner very little damage will result. Other insects are the black and green aphids, red spiders, thrips and wire worms. The aphids can be avoided by planting late, as they do their work in the early part of the season. The red spider can be controlled by dusting with dry or spraying with atomic sulphur. There is no practical control for the thrips; it is one of the chances that the bean grower has to take. Wire worms begin by attacking the seed and continue working on the growing plant. For the wire worm apply 1000 pounds of freshly air-slaked lime per acre.

Cost of Production

This will be higher than usual this year. Seed is extremely high and the figures below, considering former prices, are only to give a basis for figuring approximately the cost per acre: Plowing $2.00, sub-surface packing and fining soil $1.40, seed $1.00, seeding 35 cents, three cultivations $1.50, hoeing $1.00, harvesting $1.00, threshing at 25 cents per cwt. (probably too low) $2.75, sacks and cleaning $1.60, total $12.60. This is for the smaller beans; Limas cost per acre probably around $20. In addition there is irrigation, if needed, cost depending upon locality. Average yield per acre one-half ton or 1200 pounds.

NOTES

Get Good Seed—Where one can secure cheaply enough possibly seed which was weevil-infested but which has been treated may answer. It must be planted much thicker than good seed, however, and labor is too expensive to run any chance this year.

With Limas seed of several different strains are grown and these each have their friends. The kind which is known to be adapted to the section will do best.

A liberal supply of sulphur will prevent mildew and possibly do much good.

Inoculate seed, that is, if the soil needs it. Soil which has grown successful crops of beans, alfalfa soils, or almost any soil rich in humus will probably not require inoculation in order to secure successful bean crops, but where one is planting under desert conditions or in places where leguminous crops have not been produced crops will be materially increased by inoculation with nitrifying bacterial cultures. This may be done by using soils known to be inoculated or, far simpler, by the use of cultures which now may be purchased of almost any seed concern. Full directions for using these cultures are given by the dealers.

Harvest is several months off but some who would plant beans have said "There is no thresher near." But even in some of the most successful bean growing sections the old pioneer way of "tramping" out the beans is still followed when necessary. With

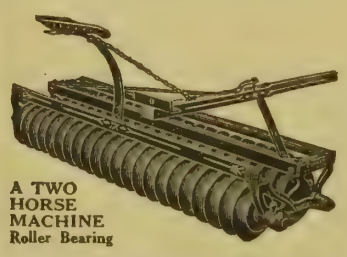
Saves Moisture

The Culti-Packer does every one of the three things necessary to save moisture in dry seasons—it pulverizes the soil, firms out all large air spaces and stirs the surface to form a mulch.

If you want to beat the drought, Culti-Pack your fields after plowing, then again after seeding to firm the soil about the seed, and finally use the Culti-Packer on the wheat, corn, oats, etc., until it begins to joint.

Order a Culti-Packer from your John Deere dealer before the dry weather sets in.

Showing how rear wheels split the ridges left by front wheels thus forming a mulch.



A TWO HORSE MACHINE
Roller Bearing

FREE BOOK "Soil Sense"

Tells how the Culti-Packer is used for saving moisture and for nine other important farm jobs. 48 pages, 100 soil photographs.

What are Pedigreed Trees? We want You to Reason Before You Buy Citrus Trees.

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries,—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertilizer, labor, investment tied up in land—these are the big factors that go to pot if, years after the trees are planted, the grove bears miscellaneous offspring.

Oroville Grower Explains Method of Pruning Young Olive Trees

By C. L. Chaffin in The Olive Grower

MOST growers will have finished pruning their young olives by the first of February, but it is not too early to consider the plan or method to be used next season.

One-Year-Old Trees

When the trees were set out they were headed back to one main stem 20 inches above the ground. Twelve-inch tree protectors were put on so that the new growth came out on the upper ten inches. These new shoots, which are to form the laterals, were thinned out at the end of the first year's growth. From three to five were left to form the main laterals, these being spaced as far apart as possible. In no case were these headed back, i. e., the ends clipped back. Heading back a vigorous growing olive tree by a method similar to that practiced with certain deciduous fruit trees does not make it more stocky but hinders its development. The olive tree, which makes a strong vegetative growth of say four feet in one year, will tend to reduce its growth the following season. It does not need to be cut back but, if left alone, will usually check itself; whereas if vigorously cut back it may be forced to throw out more vegetative growth to regain its balance, thus defeating the very object for which the heading back is done.

Thus for the first year we have from three to five laterals well spaced between ten inches and 20 inches above the ground. These laterals are not cut back nor are the small branches thinned out.

When the trees are pruned this way the first year, the second, third and fourth years the pruning is very simple. It is only necessary to remove the cross limbs and crooked or broken branches. In some cases it may be advisable to thin out a few small limbs. The main laterals should always be kept in mind, pruning each year to keep them straight, properly spaced, and growing in the proper direction to make a strong, open, symmetrical goblet-shaped tree.

The real injuries which result from clipping back the main laterals are, (1) It causes a crooked lateral, for the branches in an olive tree come at right angles to the main branch. Crooked laterals check sap flow and cause many suckers to grow. (2) It removes part of the foliage which is very much needed to strengthen and extend the root system. (3) It causes the laterals to be weak, due to several right angle turns and it makes a bad appearance, thus reflecting discredit upon the orchardist.

It has been our practice to leave as much of the foliage as possible on the trees. The olive, being an evergreen tree and some of the leaves remaining on the tree for three years, needs all the foliage possible in order to make the fastest growth.

Each year any trees that may have been blown over or do not stand straight should be straightened and tied to stakes. One-year-old trees, which should be over three-quarters of an inch in diameter when planted, very seldom blow over. If they are properly staked when two or three years old, they probably will not need staking after four unless the ground gets very soft and the wind unusually strong.

The writer has recently completed the job of pruning and staking 350 acres of young olives near Oroville. A map was made of each block showing the individual trees and indicating their present size and condition, An accurate account was kept of the materials and time required for this work, and at the current rate paid for labor the cost was as follows: One year trees, 60 acres cost 45 cents per acre; two year trees, 50 acres cost 50 cents per acre; three year trees, 150 acres cost 55 cents per acre; four year trees, 60 acres cost 65 cents per acre; five year trees, 30 acres cost 70 cents per acre.

The average cost per acre for pruning, staking and mapping the 350 acres was 52 cents.

The Ideal Walnut

IN a discussion as to the walnut and its culture L. D. Bachelor of the experiment station staff at Riverside gives as his idea of the ideal:

"Before taking up a discussion of the merits of our present day varieties of walnuts, it will be well to consider the characteristics which may be looked for in a so-called 'ideal variety.' It is not to be expected that an ideal or perfect variety of walnut will ever be found any more than a perfect apple, a perfect orange or a perfect man. An ideal is necessary, however, as a guide in any progressive undertaking, and the more nearly we approach such an ideal, the greater our success.

"Heavy production is the first and most important quality. A fancy market nut may be unprofitable if the tree is a light producer. The average production for the state is less than 1000 pounds per acre, amounting to about 50 pounds per tree. This low yield is due in part to the wide variation among our seedling trees. Certain trees in a grove may produce as high as 200 pounds, while others may average less than 20 pounds. Since individual mature grove trees produce as high as 200 pounds of nuts as a yearly average, this figure should not be considered as too high a standard to set. Many solitary trees with plenty of room for top and root development will exceed this standard nearly 100 per cent. Due observance should be made, however, that such trees usually experience ideal environmental conditions for the development of the one individual, while trees in a grove are keenly competing with each other for sunlight and moisture.

"Precociousness or ability to reach profitable bearing at an early age is a desirable character in any fruit if this tendency does not impair the future usefulness of the tree. Whereas the 'prolific' variety will possibly average 30 pounds of nuts per tree the fourth year, most varieties now grown will fall short of this standard about 50 per cent.

"The character of the nuts of varieties and seedling trees varies widely and may make a difference of nearly 100 per cent in the selling price. Commercial seedling nuts are graded in three sizes, namely: the second grade includes nuts which will pass through a square hole 1 1-32 of an inch in diameter; the first grade will not pass through the 1 1-32-inch hole but will drop through a 1 3-8-inch square opening; a third grade includes all nuts known as the Jumbo grade. By far the greatest commercial demand is for the medium sized or first grade nut. Regardless of size, the nuts should be uniform in shape and relatively smooth, presenting the appearance of standardized product. This is not possible with seedling trees for although this product is graded strictly for size, the nuts vary in shape to a considerable extent. Of course these last two points, uniformity and smoothness, are simply market fancies, but there is a commercial premium of three or four cents per pound on them nevertheless. The color of the shell is of minor importance as the bleaching process makes up for a deficiency in this regard. The shell should be of medium thickness and well sealed so it will pass through the packing house machinery without injury, and yet it should be easily cracked with a small nut cracker. The very thin shelled varieties are apt to crack open during the harvesting processes, becoming contaminated and spoil in storage. They are also more apt to be injured by sunburn and perforation than the thick shelled sorts. The meat should crack out whole. It should be plump, light colored, filled out evenly, pleasant flavored and should compose about 50 per cent of the total weight of the nut. There is very little stress laid on quality ac-

cording to the present commercial grading so long as the nut is not actually bitter; however, as the named varieties become better known and sold under their true names the public is certain to put a premium on good quality as they do with food stuffs. There is a decided antipathy at present for the dark kerneled nuts and better prices are realized for the light meated varieties when other characters are at all equal.

"The blooming season of the different varieties may have considerable bearing on their adaptation to certain localities. The French varieties, as the Franquette, and Mayette; and the Eureka are from one to two months later than the soft shell seedlings in starting growth in the spring. The factor of lateness may avoid frosts and make such varieties preferable for the cooler sections. It seems to be a matter of observation that the late blooming varieties also avoid blight infection to some degree during most seasons; while the early varieties often encounter damp weather which is favorable to the spread of this disease. The tendency for the variety to either avoid or resist the blight is a very important considerations. Whereas no perfectly immune variety has ever been discovered, nevertheless a varying amount of injury is a matter of common observation in studying the several varieties now being propagated.

"A consideration of the adaptation of varieties to the various soil and climatic conditions of the state is of prime importance in choosing the sort for one's local conditions. Although the French types are successfully grown in Central and Northern California and in Oregon, they are a total failure in the chief walnut sections of the South. Even greater sensitiveness to environment may be observed in comparing the behavior of the Franquette and Eureka grown in Santa Clara and San Joaquin Valleys. The Franquette seems to be adapted to conditions found in the Santa Clara Valley whereas the Eureka thrives best in the San Joaquin Valley. Certain varieties may endure the adversity of a light sandy soil much better than their surrounding neighbors. The densely foliated sorts should withstand to a greater degree than the sparsely leaved ones, the high temperature and low humidity of the inland valleys; sunburning of the twigs, trunks and nuts is a serious factor to be contended with in such localities. As our knowledge of varieties increases everything points to an eventual production of a greater number of varieties, each of which will be especially adapted to a particular soil and climatic condition. In selecting varieties for the new sections, a thorough study should be made of the few trees of the locality and the behavior of varieties to the various soil and climatic conditions."

DATE SET FOR UNIVERSITY FARM PICNIC

One of the biggest agricultural events in the state, "Picnic Day" at the university farm, Davis, has been set for next Saturday, April 28. This event has grown from a mere picnic under the trees to a gathering at which last year 15,000 people were present and 2800 automobiles were accommodated.

Picnic Day is managed by the students at the university farm and consists of exhibits, lectures and demonstrations by the divisions of the experiment station, stock judging contest, athletic contests, speeches by prominent Californians, and a parade featuring floats of an ornamental and humorous nature, and some of the finest live stock in the state.

The lectures and demonstrations of the divisions will be of such nature that a great deal of information can be obtained in a short time concerning hog feeding, truck gardening, poultry raising or other branches of agriculture.

Members of the faculty and student guides will be on hand at all times to answer questions and give information.

Accommodations will be arranged for 30,000 people, and will include a guide service to conduct parties around the farm; a free checking station and information bureau. A playground will be made where small children can be left in competent charge, and coffee and cream will be served to those bringing their own lunches.

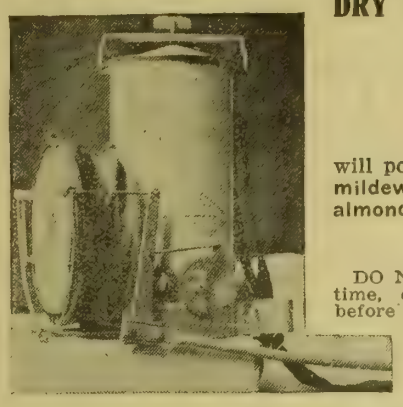
BE ON YOUR GUARD

RED SPIDER and MILDEW are active NOW. Every bit of your crop will be needed this year. Are you doing all you can to save it?

"A Puff in Time Saves the Vine."

DRY SULPHUR applied with the

American Beauty Dust Sprayer



will positively destroy red spider, mite, and mildew on vines and trees—grape, prune, almond, citrus fruits, etc.

Mr. ORANGE-GROWER

DO NOT let your red spiders multiply. Save time, expense, and fruit by "getting them" before they "get you." Do you know how much damage they cause in your groves? Dust now. Get an American Beauty at once. The best dust sprayer that money can buy.

For sale by all progressive dealers. If your dealer can not supply you, send us $11.00 for a vineyard size, or $13.50 for an orchard size machine, and we will send you an AMERICAN BEAUTY DUST SPRAYER, all charges paid. Try it a week. If it is not entirely satisfactory, return it at our expense, and we will cheerfully refund your money. Send for circular and price list today.

160 ACRE FARMS IN WESTERN CANADA FREE

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat near $2 a bushel offers great profits to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops.

You can get a Homestead of 160 acres FREE and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of **Oats, Barley and Flax.**

Mixed farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war. The Government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

Gilbert Roche, San Diego, Cal. — Canadian Government Exhibit, Canadian Gov't Agt.

SULPHUR

Fleur de Soufre, Anchor Brand, Velvet Flowers of Sulphur and Eagle Brand.

Packed in barrels and double sacks are the fluffiest Sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH. SEND FOR ILLUSTRATED BOOKLET, also PRICE LIST and SAMPLES.

We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The magnitude of the bean industry is impressed at least to a small degree by the photograph on the cover page and by the illustrations of plowing on Page 464. In the matter of Lima beans a very small section of Southern California produces more than any other similar amount of land in the world, and our reputation is world wide. In Small Whites thousands of tons go to Boston and often come back to California in cans. This year's production will probably be greater than any previous year's. Hence we take pleasure in talking for more and better beans in this week's Cultivator. This is no year for new varieties. Stick to the staples. Produce more and better.

EFFICIENCY

Touching one point which we made on this page last week:

Labor is going to be scarce and high. Every farmer should fortify himself by supplying his ranch with the latest labor saving machinery and equipment. Right now is the time for you, Mr. Farmer, to push your production to the limit. Use every means at your command to bring into use all the labor saving machinery you can possibly use. It will be dollars in your pocket.

Labor saving implements of every form should be brought into action. Where a tractor will save one or two men it will justify a material investment. Cultivators which will work two or three rows of beans, beets or other product should be used instead of one-row cultivators. Instead of planting with the hoe use planter or drill.

It costs money to equip, but it takes equipment to make money. This is the year when patriotism and profit both demand efficiency.

MORE LABORERS

While highest efficiency demands fullest preparation, it is very probable that the labor situation will not be so serious as anticipated by many.

The Farmers' Protective League is urging the passage of a bill empowering the governor to increase summer vacation period in all schools and colleges to enable pupils to aid in farm work. Already in Los Angeles the upper classes of the high schools have been excused to aid in sugar beet thinning. This will not afford hardened ranch labor, but at the same time it will give, as a rule, a most effective force, if properly directed. Again, as on former occasions, it is very probable that clerks and others may be excused in time of stress to aid in the harvesting campaign.

Effort is now being made to perfect a systematic organization or group of organizations which may be able to distribute and aid this type of labor.

THE STATE COUNCIL

The California State Council for Defense, which was recently appointed by Governor Stephens, announces a survey of California for a food mobilization campaign. In the endeavor to spread the gospel of greater production the council has appointed meetings for various sections of the state. These will be held during the present week and continue through the next. Addresses are being made on methods of work, and farmers are being shown the necessity for highest production.

PATRIOTIC RESPONSIBILITY

Secretary Houston wires under date of April 15 to Cultivator readers:

"I desire to call your attention to president's appeal to the nation appearing Monday morning. Hope you can display it in full, emphasizing in full the parts addressed to farmers. Your cooperation will be appreciated."

The president says:

"My fellow countrymen:

"The entrance of our beloved country into the grim and terrible war for democracy and human rights which has shaken the world, creates so many problems of national life and action which call for immediate consideration and settlement but I hope you will permit me to address to you a few words of earnest counsel and appeal with regard to them."

The president then refers to the army and navy both being forced into preparation for the great task before them. "There is not a single selfish element, so far as I know, in the cause we are fighting for." "We are fighting for the rights of mankind and for the future peace and security of the world." "To do this great thing worthily and successfully we must devote ourselves to service without regard to profit and with energy and intelligence." "Besides fighting, these, then, are the things we must do:

"We must supply abundant food for ourselves and the army and for the nations with whom we have made common cause.

"We must build ships.

"We must mine coal.

"We must improve railways.

"We must develop to the limit every industry.

"Above all, to the farmers:

"The supreme need of our own nation and of the nations with which we are cooperating for an abundance of supply, especially for the present year, is superlative. Without abundant food, alike for the armies and the peoples now at war, the whole great enterprise upon which we have embarked will break down and fail. The world's food reserves are low. Not only during the present emergency but for some time after peace shall have come both our own people and a large proportion of the people of Europe must rely upon the harvests in America. Upon the farmers of this country, therefore, in large measure rests the fate of the war and the fate of the nations.

"The supreme test of the nation has come. We must all speak, act and serve together!"

HOGS AT $3000

Chicago is reporting some prices on live hogs; 12 cents, then 14, 15, 16, 16½. We are not certain, but we believe 17 has been touched. The like has never before been known.

California hogs are still higher priced. Humphrey's boar at $3000 per one hog seems to be, as Frost would say, "Some hawg", but he is a long producer, and blood will tell.

BE FAIR TO THE BOY

We recently saw a cartoon in an Eastern farm paper showing a farmer being handed a roll of bills by the purchaser of his boy's pony. The boy, with tears running down his face and arm about the pony's neck, sees his pet being sold and of course the money going into dad's hands. Under the cartoon is this:

"Resolved, That I will never again sell any animal belonging to one of the children and pocket the money. Hereafter the horse, calf, pig or other pet shall be his to keep or sell, and if sold, the money shall be his."

The father can do no more unfair thing than to sell the property which by all right belongs to his son, and as a matter of policy such treatment of the youngster is the best method of destroying any desire to remain on the farm.

A BIT COLD

Monday morning was somewhat nippy. Newspaper reports, which we hope are exaggerated, claim that in Sutter and Yuba Counties the cold was severe enough to materially injure even apricots and prunes and severely injure less hardy garden truck. The wire shows lowest temperatures that morning at Red Bluff, 34; at Sacramento, 38. This would not indicate any severe injury.

Wednesday morning was the coldest in the south. At San Bernardino a temperature of 31 was registered and at Los Angeles, 36. It is thought that this will not injure even the most tender plants.

HONEY

Phone messages from some of the larger honey producers indicate uncertainty as to the coming output. All producers are hoping for a rain. If this should be given during the next few days there is every promise of a big crop. If, on the other hand, a drying wind should sweep over the sage the crop will be cut far below normal. Producers are in position to take advantage of favorable conditions, and the output will be immense if the rain does come.

DRY MARCH

March, 1917, was about the dryest ever. March is a month of heavy precipitation; the normal is around three inches. In many sections the precipitation this year was not much over one-eighth inch, in fact, no rain at all. Too bad, but we are still hoping. Meantime, let every producer conserve every drop possible.

Agricultural Notes

Siam has planted 200,000 acres more to rice this year than last.

Florida's shipments of oranges are so far much behind last year's.

A bonus for grain production on hitherto unused lands is this year.

The United States secured from Odessa, Russia, last year 385,000 pounds of beet seed.

Frosted oranges from Florida last month brought as low as ten cents per box on the Chicago market.

Over a million and a quarter acres of land in the United States were devoted to raising tobacco in 1915.

Several cars of frozen and decayed Florida oranges were ordered dumped from the rails in Pittsburg last week.

Japan has harvested an enormous crop of rice, more than 12,000,000 bushels in excess of her last year's crop.

The American Railroad Association reports the net shortage of freight cars in the United States on March 1, as 124,973.

Bean oil is being shipped to Seattle in large quantities from Dairen, Manchuria. Counting shipments made since February 1 and those now on the way the total is 40,000 tons.

New Zealand's average yield of wheat per acre during 1916-17 harvest was 25.15 bushels; oats, 30.88 bushels. The total yield of these grains is much less than the previous year.

Estimated shipments of fruits to the United States from the Porto Rico Fruit Growers' League from March 10 to July 1 will be 444,000 crates of pineapples, 91,000 boxes grapefruit, 7500 boxes oranges.

The handling of modern tractors and other improved farm machinery is being taught to mutilated French soldiers in the great school at St. Etienne which is devoted to training the crippled veterans to work suited to their disabilities.

The area of the Bermuda onion crop for Texas for 1917 was estimated on March 15 at 12,050 acres, an increase of about 2000 acres over the area for 1916, when that state shipped out 4903 carloads. The average yield per acre last year was 225 crates.

"If we are to have war, we must have roads; if we have peace, we must also have roads. It may be that I can be of the most service to my country, whether in war or in peace, by promoting in every way possible the building of better highways", said Senator Bankhead at the big roads celebration at Birmingham, Alabama, April 7.

A law passed by the national congress of Peru at its last session and approved by the president of the republic on February 10, 1917, provides for a prize of $500 to be awarded for the best text from which to teach temperance in the public schools of Peru. Intemperance, especially in the mining regions, is said to be a serious problem in Peru and Bolivia.

The Automobile Association of America has prepared a special transcontinental map containing the present main travelable interstate and intrastate roads which would fit into a countrywide system that would lend itself in great degree for military purposes. One of these maps goes to President Wilson, one to Maj. Gen. Hugh L. Scott, one to Brig. Gen. Joseph E. Kuhn of the war college division, and a fourth to Director W. S. Gifford of the Council of National Defense.

Agricultural News Notes of the Pacific Coast

Northern California

Recent rains have been of great benefit to grain crops.

Biggs, Butte County, reports grain prospects the best in years.

A bill removing protection from blackbirds has been passed by the assembly.

Almond growers of Sacramento County report promise of a better than normal crop.

Several requests have been made of Colusa County supervisors for a farm adviser fund.

An armed guard has been placed on the government dam of the Orland irrigation project.

Horticultural Commissioner Gould of Yolo County estimates the almond crop at 80 per cent.

A peach grower of Oswald, Sutter County, reports sale of his entire crop on the trees at $45 per ton.

The schools of Gridley, Butte County, have an agricultural club which this year will raise corn and beans.

There will be local meetings of the Glenn County farm bureau at Elk Creek April 23, 26, 27, Plaza April 27.

Horticultural Commissioner Hassler of Eldorado County, reports very little damage to orchards from the recent frosts.

The Chico Business Men's Association is today holding a rally at Chico to urge a farm adviser for Butte County.

The Pioneer Mother-Daughter Canning Club of Orland, Glenn County, will hold its next meeting April 27 in the afternoon.

Nine hundred acres near Arbuckle, Colusa County, have been planted to sugar beets by the Sacramento Valley Sugar Company.

Hop growers are warned to reduce their acreage as the demand is small and the prices very low. There is also a large surplus of holdover.

Hereford breeders of California and the Pacific Coast have been invited to meet on the evening of May 2 at the Palace Hotel in San Francisco.

Dairymen of Northern California will meet at Colusa at an early date to consider the forming of a branch of the Northern California Milk Producers.

The Sherer Company made a recent shipment from Arbuckle, Colusa County, of three carloads of cattle to Los Angeles at an average price of $122.50 a head.

Stock growers of Mendocino County have formed an association and adopted a constitution. The association is to meet in annual convention on the first Saturday in October of this year.

A. B. Humphrey of Mayhews has sold for $3000 Grand Leader 2nd, the Berkshire boar who was grand champion at the Panama-Pacfic. Twenty of his sons and daughters were sold at the same time for $1500.

At the California Forest and Wild Flower Fete to be held at the Fairmont Hotel, San Francisco, April 24-28 the forest service will install a model ranger camp equipped with telephone, heliograph and fire fighting tools.

Two thousand sacks of Colusa County rice were sold recently to a San Francisco firm at $2.20 per sack, this price including freight charges to San Francisco. The company making the sale has on hand in the neighborhood of 30,000 sacks unsold.

Central California

Hay is bringing $32 and $32.50 a ton in Stockton.

Stanislaus County has prospects for a good crop of Smyrna figs.

The Stewart packing house at Sanger has started on Valencias.

A four-mile parade is promised at Fresno on Raisin Day, April 30.

Efforts are being made to organize a branch of the Farmers' Protective League in Stanislaus County.

A branch of the Lundy Dried Milk Products Company will be established at Newman, Stanislaus County.

The March report of the Stanislaus cow testing association shows 70 cows testing over 45 pounds butter fat.

A fund of $1000 has been assured by Coalinga for the state poultry show which will be held there November 14-18.

The F. H. Buck ranch in the Christian Colony is provided with 200 smudge pots for use in deciduous orchards.

More cattle will be allowed grazing privileges in the national forests of California during the next season than ever before.

Amendments of the workmen's compensation act, now before the state legislature, provide for bringing farm labor under compulsory state insurance.

The California Peach Growers plans to erect packing houses at Hanford, Selma and Parlier. Construction has already begun on the plant at Kingsburg.

The Lindsay-Strathmore irrigation system is now 90 per cent complete. Twenty wells ranging in depth from 90 to 204 feet are now ready to supply water.

Poplar, Tulare County, expects a large bean crop this year. Many contracts have been signed for Blackeyes on a 5½ cent basis with five cents for Teparies.

The approved grazing allowances for the national forests of California during 1917 provide for 521,000 sheep and goats, 221,000 cattle and horses and 6,600 swine.

The next meeting of the Stanislaus Fig Growers' Association is to be held at Ceres June 9. Many growers have stated that they will not contract their crop until after that date.

A 12-year lease on 356 acres of asparagus land is reported for $107,043. The deal was made between R. M. Durbin of Walnut Grove and the owner, the Vrooman Company.

The Turlock board of trade is collecting data on the dairy industry of the district. The immediate occasion for gathering this information is the possibility of securing a dried milk plant.

A plan has been announced for the building of a great dam on the Kaweah River below Three Rivers at a cost of $8,500,000. The land to be included in the project takes in part of the Lindsay-Strathmore district, the Alta district, and the property of 21 ditch companies.

The Associated Peach Growers' announce that they have control of 90 per cent of the canning peach acreage in Tulare County. A sales committee has been named to handle the crop. This committee is W. A. Sims, Farmersville, J. K. Tuttle, Mineral King, and J. W. Davidson, Visalia.

Southern California

Santa Maria will hold an agricultural fair October 24-27.

G. H. Waters of Pomona reports sale of 40 acres of apricots at $50 a ton.

Beet growers of Chino have organized an association with E. V. Wire as president.

There was much trouble in the citrus orchards of Rivera last week with gangs of striking Mexican laborers.

Manager Hamilton of the Hemet Orange Growers' Association reports sales of blood oranges at $3.35 a box.

At a recent meeting of Arlington poultrymen discussion was had of plans for protection from chicken thieves.

Apricot growers of the Hemet Valley who have suffered loss through frosts are urged to plant tomatoes for the cannery.

The Lankershim district in Los Angeles County reports a 40 per cent apricot crop in sight and hopes for a $50 a ton price.

Imperial Valley sheep growers report many sales of lambs on the Los Angeles market at prices ranging around 14 cents.

Manager Thorpe of the California Walnut Growers' Association addressed the Walnut Association at Hemet last week.

Orange growers along the foothill boulevard in Claremont are losing great quantities of fruit through the vandalism of automobile parties.

A meeting was recently held at Arlington, Riverside County, in the interests of the formation of a county farm bureau and the appointment of a farm adviser.

Enough signatures have been secured to assure the calling of an election in the Imperial irrigation district for the issuance of $2,500,000 bonds for improvements to the canal system.

The Pomona Milling Company is reported contracting Blackeye beans at six cents. It is estimated that 5000 acres will be planted to Blackeyes in the district between Pomona and Etiwanda.

The Puente Walnut Growers' Association held its annual meeting in the West Covina club house on April 10. L. D. Bachelor of the state experiment station was one of the principal speakers.

Growers of Egyptian cotton can now procure seed without the formality of application to Arizona authority as County Commissioner Waite has just released a carload of seed imported from Maricopa County.

Farmers of the Imperial Valley who have found benefit from the work of lady birds in their cantaloupe fields are asked to write to the legislature asking more aid for the work of the state insectary the coming year.

The board of supervisors of Santa Barbara County has passed an ordinance making it a misdemeanor for traction engines and farming implements to travel on oil surfaced roads unless the vehicles are so made that they will not injure them.

An incipient strike of Mexican laborers on the Limoneira Ranch at Santa Paula last week was promptly squelched. The management of the ranch two weeks ago gave all laborers a 25-cents a day raise and some of the Mexicans thought this indicated that they could get anything they asked for.

The Coast

Washington County, Oregon, will hold its fair October 2-5.

There are still 15,000 bales of hops in the hands of Oregon growers.

The Salmon River section of Idaho reports a long cold winter, with feed exhausted.

Roseburg, Oregon, will hold its strawberry festival three days beginning May 17.

The Coos and Curry Fair Association has chosen the dates September 12-15 for its annual fair.

The first shipment of Japanese Irish potatoes on the Seattle market was sold last week at $50 and $55.

The agricultural class of the Chandler high school is able to sell a good many vegetables to the townspeople.

A number of beet loading stations are being erected in districts where farmers are agreeing to plant this year.

The construction work on the Nyssa-Arcadia Drainage District of Idaho is nearly completed. The work has cost $70,000.

Potato growers of Benton County, Oregon, recently met at Irish Bend and formed a county potato growers' association.

Apple growers of the Yakima Valley are not planning to wrap their apples this season because of the high price of paper.

The state university extension department of Arizona is organizing various planting clubs among the school children. There are corn clubs, cotton clubs, sorghum, potato, pig, poultry, canning, etc., clubs.

The Round Valley Farm Improvement Association of Apache County, Arizona, has arranged for the importation of a carload of Swedish select oat seed from Portland, Oregon. The same association is now importing a carload of dairy cows.

Timely Hints for the Home Gardener

PRACTICALLY all truck crops do better on a sandy loam soil than on one that is sticky and heavy. Larger-sized crops, however, such as cabbage, tomatoes, beans, and peas, will do well on heavy soil provided it contains the necessary vegetable matter.

The soil in most backyard gardens is distinctly heavy. It will help the soil greatly if the owner works into it a good amount of finely sifted coal ashes free from all cinders. Coal ashes are used largely for the physical effect in breaking up a compact, heavy soil. Such ashes do not take the place of fertilizer.

Plentiful use of well-rotted manure is still more beneficial in breaking up heavy soil because this improves the texture and adds fertilizing material.

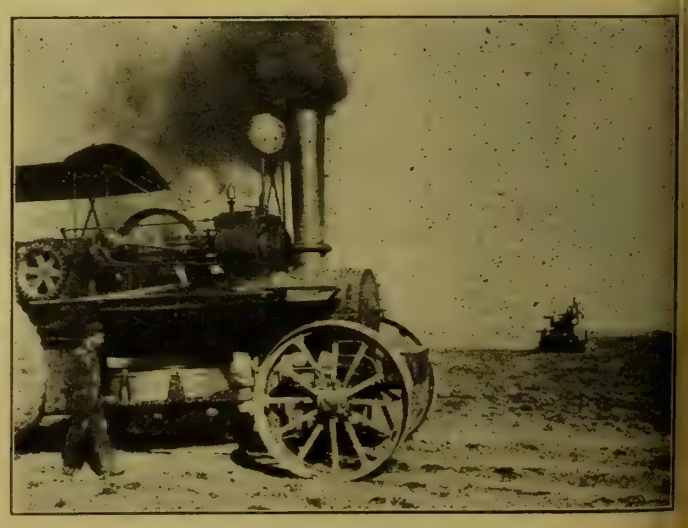
Many garden soils are sour. To offset acidity and also to improve the physical properties of the soil the garden specialists recommend the use of lime. Burnt lime should be applied at the rate of 1,000 pounds to the acre or slaked lime at the rate of about 1,500 pounds per acre. A garden plot 50 by 100 feet is approximately one-ninth of an acre.

To apply the lime, broadcast it and mix it freely with the surface soil by harrowing or raking. Lime should be applied before the crops are set out or planted and should not be applied at the same time that fertilizer or manure is put on.

Manure will greatly improve land. If well-rotted manure is not available, it may be advisable to use a complete chemical fertilizer. Apply at the rate of 800 to 1000 pounds per acre a mixture containing 2 to 4 per cent nitrogen, 8 per cent phosphoric acid, 1 to 2 per cent potash. The amateur gardener will find it easier to use ready-mixed fertilizer, which can be obtained from any reliable dealer.

Sunlight Necessary

No amount of fertilizer, watering, and cultivation will make up for the absence of sunlight in a garden. Home gardeners before attempting for the first time to use a back yard or other space should consider carefully how many hours a day any part of the yard is in shadow from buildings, fences, or trees. At least five hours of sunlight a day is necessary for a successful garden. The more sunlight they get the better it is for most vegeta-



Preparing for Bean Crop

California ships millions of dollars' worth of beans, not from back yards either, but from great ranches. One ranch alone will this year market $1,250,000 worth of beans. Great production requires great implements.

At the top: Tractor in Ventura County at fall plowing. Middle picture: Great gang of plows operated with cables by two engines a half mile apart. The lower picture shows closer view of one of engines with drum drawing the gang which is approaching. When it reaches the end it is reversed automatically and the engine a half mile away—a mere speck at the extreme right of picture—begins its work while this engine moves forward some 16 feet to be ready for the return.

bles. For this reason it is bad practice to put plants of low habit between tall-growing plants which will shade them for the greater part of the day. As a rule, foliage crops such as lettuce, spinach and kale do fairly well in partial shade, but even these must have sunshine two or three hours a day. In laying out the garden, therefore, use shadier parts for such plants and reserve the sunny spaces for those which must have plenty of sunlight to grow and fruit properly.

BEAN PLANTING NOTES

Continued from Page 459

small lots even the old time hand flail is used successfully and we have known of hundreds of sacks being threshed on great "threshing floors" of smoothed off dirt on which the vines are piled and threshing done with single animals or with teams hitched to disk cultivators. Where there is a will there is a way of threshing.

Prepare the ground in good season but don't plant seed too early. The ground wants to be warm and there are other advantages from late planting in some sections, as may be seen in the preceding article.

Cultivate shallow. Like corn, beans root near the surface.

Keep in best of condition until blossoming time. When in bloom if possible keep out of the field.

GARDEN BEANS

Written for California Cultivator
By D. F. Reichard

UNDER this heading are included string or edible pod, shell and garden Lima beans. The string or edible pod beans were first discovered in northern South America and were altogether of the vining habit. From these were developed dwarf varieties which matured in less time than the originals. With the shortening of their growing season the area of their distribution has been extended to the northern limits of the United States.

The ideal conditions for garden bean growing are plenty of warm sunshine with the air tempered by cool breezes, a friable soil that retains its moisture well, but is well drained. These conditions are found in Southern California, and fresh garden beans are obtainable eight to ten months of the year. During October and November the hardier varieties of beans are planted in frostless districts for early markets. These are harvested during February and March according to the season and are mostly sent East to those who can afford to pay for them. They bring from 20 to 40 cents per pound. The varieties used for this and the early spring plantings are almost exclusively the Canadian Wonder for the green beans and the Ventura Wonder Wax for the yellow pod beans.

In the Imperial and Coachella Valleys the weather is warm enough so that plantings may be made during February. The product of these is ready for market during April, getting in just ahead of the beans grown nearer the coast.

As spring weather comes on beans may be planted freely, first the hardier bush or dwarf varieties such as the Canadian Wonders, Early Valentine and French Mohawk. These are of the flat type and are inclined to be stringy if not picked very young These are followed by the tenderer round podded varieties such as Burpees Stringless Green Pod, which is the most popular bush bean grown; Stringless Refugee Green Pod and Early Refugee, in green pods, and Stringless Refugee Wax, Black Wax and Golden Wax in the yellow podded varieties.

By the middle of April in practically all locations any or all varieties can be planted. At this time the popular Kentucky Wonder and other pole or vining varieties and all varieties of Lima beans are put in. There are four varieties of Kentucky Wonders offered, each with its good points. The brown seeded, or Old Homestead, is the most popular. This has light green pods. The White Seeded Kentucky is becoming very popular with the market gardeners because it has a deep green pod, giving it a very attractive appearance. Besides it is more resistant to mildew than the ordinary Kentucky Wonder. The gray or speckled seeded is a particularly good variety, having deep green pods considerably broader than the other varieties. This variety must be poled to get the best results. Then there is the Kentucky Wonder Wax which has the good qualities of the other varieties of Kentuckys but with clear waxy yellow pods.

Lima beans may be planted as early as March, but to little purpose as beans will not set on the vines until warm weather has set in during July. The bush varieties are far more popular than the pole varieties although the latter will produce more pods per plant. Fordhook bush is becoming the most popular of the dwarfs on account of its plump kernels.

From the middle of August on we use only very quick maturing varieties like Early Refugee or the hardier ones like the Canadian Wonders. During the late fall months a coarse bean known as the Horse or Broad Windsor Bean, is planted for winter use. This bean is highly prized by Europeans as a shell bean.

Garden beans require fairly rich, loose, well drained soil, well cultivated to insure a quick uninterrupted growth.

The plot selected should be deeply plowed and thoroughly harrowed and leveled. If rains do not come irrigation must be resorted to. Each rain or irrigation should be followed by cultivation to make a mulch to retain moisture and destroy weeds. Bush varieties will be ready to pick six or eight weeks from planting, pole varieties and Limas, two to four weeks later.

When beans have been up four or five weeks they should be sulphured by dusting a small quantity of flowers of sulphur over the plants. This prevents mildew. As soon as the crop of green beans has been gathered it is advisable to plow the vines under. They make fine fertilizer. There are some varieties, however, that produce several crops, notably the Kentucky Wonder; green beans may be gathered for several months.

BEAN QUERIES

Irrigating at Blossoming Time

I shall plant Blackeye beans near Hemet this spring. I understand that irrigation during blossoming causes blossoms to drop. Is this true? Is there any particular time for irrigating?—Subscriber, Los Angeles.

We might answer either yes or no to the above question and both would be correct, likewise incorrect. That is, if the plants are growing, have had sufficient water and are still not suffering there would probably be no injury. However, it must be borne in mind that the blossom of most beans is very delicate and cultivation at blossoming time or working about the vines in a way to injure in the slightest the blossom may cause it to blight and drop. Again, if the plants have been allowed to dry off, irrigation might cause such a shock to the plant that the blossoms would drop, therefore the safest course would be, for the grower to anticipate blossoming time and have the plants in best condition to carry over until the beans are set. Again, the bean plant is of such a delicate nature that when cultivation is done in the morning while covered with dew the slightest injury to foliage may permit the entrance of fungus and serious injury may result.

Weevil in Beans

Notwithstanding we have repeated many times information regarding destroying weevil in beans, requests continue to come for this pest has proved exceptionally exasperating the past year. Place beans in tight room, or, better, a tight bin or box. Use carbon bisulphide full strength in shallow vessels or plates, set on top of the beans. The gas which arises from this chemical is much heavier than the air and will settle through the mass of beans. It must be used in a box as nearly air tight as possible and the beans left in the fumes 24 hours or more. Use the bisulphide at the rate of a pint to each 1000 cubic feet. This is not a preventive for after the beans are exposed to the air and the fumes of the bisulphide have entirely disappeared they are subject to another attack, therefore keep the beans or peas stored where it is impossible for insects to reach them. Before storing in the fall all beans from the field should be treated. Always bear in mind that this gas is explosive and a lighted cigar or other fire brought near it may cause serious damage.

PESTS of the GARDEN

"Corona Dry"

—is used by thousands of the largest and most successful commercial growers and planters of the nation. Why permit your garden to be ruined when at small cost you can protect it with Corona Dry—the world's best insecticide. Get from your dealer or direct from Germain Seed & Plant Co.

Does the Work OF Two Men and Six Horses

"ONE man with the Advance-Rumely "8-16" tractor can do as much or more work than two men and six horses", says an "8-16" owner who has proved it.

The "8-16" is strictly a one-man outfit. Tractor and plows are combined in a single machine and plowing is made a one-man job.

"It beats any tractor handling the plows that I've ever seen."

With the Advance-Rumely "8-16" you plow the same as you do with a horse-gang—the plows are right in front of you, the work always in sight.

You can back up with the plows, cut square corners and work close up to the fences.

"It has lots of power on the belt and at the draw-bar."

Besides handling your ground working equipment, the Advance-Rumely "8-16" will give you equal efficiency on the belt,—in fact at any power job, draw-bar or belt.

Successfully burning distillate and similar cheap fuels, the cost of operation is low.

The "8-16" has a powerful four cylinder motor, all working parts are well protected and the carburetor is equipped with a special air cleaner.

Ask our nearest branch for a catalog of this new one-man all purpose outfit.

ADVANCE-RUMELY

This line shows the manner in which water flows from an ordinary cylinder pump.

This line shows the manner in which water flows from the Luitwieler (non-pulsating) pump.

The distinctive construction of the Luitwieler makes possible an amazing saving in power and upkeep cost. It lifts the water in a steady, even stream. Thus all undue strain, friction, jar and vibration—the chief causes of all pump troubles—are eliminated.

The Luitwieler is mechanically perfect and occupies a unique position in the field of pumping machinery.

Our free Irrigation Catalog gives you full information. Ask for it.

APOLLO BEST BLOOM GALVANIZED SHEETS

Made from KEYSTONE COPPER STEEL—highest quality and most rust-resistant galvanized sheets manufactured for Culverts, Flumes, Tanks, Silos, Roofing and Siding.

Actual service tests have proved the superiority of APOLLO-KEYSTONE for all purposes where long service and resistance to corrosion are factors. Look for the Keystone added below the Apollo trade-mark—it indicates that Copper Steel is used. Apollo Roofing and Siding Products are strong, durable, fireproof and reasonable in cost. Sold by weight by leading dealers everywhere. Send for a free copy of our "Better Buildings" booklet, giving full information and building plans of great value to every farmer and owner of buildings.

AMERICAN SHEET AND TIN PLATE COMPANY, Frick Bldg., Pittsburgh, Pa.

Pacific Coast Representatives: United States Steel Products Co., San Francisco, Los Angeles, Portland and Seattle.

Beautifying Home Grounds

Written for California Cultivator By E. Braunton

THIS article is written for the home owner who does his own planning and planting and seeks to point out what best to do.

Overplanting is one of the serious shortcomings of the novice, with both trees and shrubs. This occurs in places both large and small and even where gardeners are employed. Sometimes the fault lies chiefly with some nurseryman who wished to dispose of stock and advised too much material in the way of plants, but generally it is due to lack of judgment and foresight and realization as to ultimate size the trees will attain. If quick massed effects are desired, first plant the permanent trees far enough apart so they will not touch each other at middle age, but only with greater age. Next see that none are so placed that they will interfere with roads or paths or buildings. Then make a secondary planting of fast-growing trees and shrubs of cheap sorts with the thought in mind that these shall be cut away one by one as they interfere with the trees to remain permanently.

Do not plant many of a kind in a small place. In a large garden many of a kind add simplicity and dignity but the smaller the place the greater the necessity of entertainment through variety. It is also necessary to have many of a kind to awaken and keep alive interest in watching and caring for development that comes at various times throughout the year. Time of blooming is alone a warrant for variety, and monotony should be avoided. In small places it is best to use small subjects or you will have few in number. Use shrubs rather than trees.

If you are seeking ease of growth it will be well to use some native material, and much of this may be obtained close at home. If not, and you still wish to be relieved of care and worry use Australian and South African trees and shrubs. Native material will not prove monotonous and uninteresting for it will thrive in the garden beyond its natural development in the wilds. And what could be more spectacular than our own Matilija poppy.

It matters little how somber the background if the borders and edgings are made bright with flowers of annuals and perennials. After trees and shrubs are in place plant flowering material wherever shrubs do not come out to paths. There is no necessity for the lines to be continuous along paths or roads. If a shrub grows out to point of contact, the interruption gives valid warrant for a complete change of plant material.

I am very fond of dwelling on the necessity of thorough preparation of the soil, for it is a part of the work, the only part in fact that cannot be overdone. If a tract could be dynamited five feet deep wherever the soil is heavy, it would prove an ideal bed for roots, but too much dynamiting is done without supplementary work. If all that is done is simply to shatter the soil the results accomplished are of little value, for the soil will quickly readjust itself to former position and condition. If top soil is light, porous and rich, by washing the same down in the opened crevices permanent improvement is established. Better still to throw a few shovelsful of sand in each hole and I am not sure but the addition of well-rotted manure may be of permanent benefit. But do not waste money to shatter soil and then allow it to re-cement or again solidify. In any case plow as deeply as possible and fertilize generously and make sure fertilizer is thoroughly mixed with the soil.

After planting allow every tree and shrub to develop naturally. Prune very little; few plants demand it. Some young trees may need a clearance of the stem to enable one to get under the branches, but shrubs should be allowed to grow as they will. Growth is often much retarded by heavy pruning when young. At a more mature age no injury will accrue from annual pruning. This is also good procedure with roses, many young plants being ruined permanently by severe cutting back before a proper and sufficient framework has been grown and matured to the stage of well ripened wood, for growing wood on roses needs no cutting back, only finished growth.

Aim at some variety in smaller material, not in colors, but in class. Annuals and perennials are good but climbers must have a place, and a variety of bulbs should not be forgotten. Then, too, range outside of all this. Have a few cacti or plants of a succulent nature, also a little water garden or a wet place for bog or marsh plants. A rockery or a fernery should find place, one in the sun and the other in the shade. Or if the place be small the two may be combined. Have as many features as possible, if space is available; a sundial, garden house, pergola, arbor, seats, etc., but avoid cutting up the grounds by superfluous or useless roads or paths.

The Dependable Laurestine

One of the most dependable shrubs common in nearly all lands is Viburnum tinus, the laurestine. It may be sheared without harm into any shape or size and is one of the best hedge plants we grow. When in full bloom it is as attractive as any hardy shrub I can recall. I have one ten feet high and as far across and each year give away layered plants to friends and neighbors. It is very easy to propagate from cuttings, but easier still to allow it to propagate itself by layers. Pull down some of the lower branches if they do not already lie on the soil as they should do. Bury the branch slightly under the ground at a point a few or many inches back of the tip and allow to so remain until very early spring next year when they will be sufficiently rotted to remove to place desired for permanent growth. A hundred may thus be rooted each year beneath a large laurestine.

Deciduous Flowering Shrubs

Spireas, or bridal wreath, deutzias, weigelias, and all that class of shrubs are now in bloom, and remember that the proper time to prune these is when they have done blooming, and not in the spring. But also observe those on which you wish a greater quantity and bear in mind that in the spring just before the buds swell and while the wood is still entirely dormant is the best time to propagate from cuttings. It matters little the size of the wood or what precautions are taken; if cuttings are put in at proper time or season they are almost certain to grow. Allow them to remain in temporary home until the young plants are again dormant in early spring when they may be transplanted in bare roots to permanent position and not one plant among a thousand be lost as a result of removal.

Keep up a Procession

The charm of a garden lies chiefly in finding it attractive at all times. Daffodils and Dutch bulbs in general are now past blooming. Iris, Spanish iris, anemones, ranunculus, dwarf gladioli, etc., are now blooming, as well as snapdragons, sweet Williams and spring-flowering perennials. The unmatchable Primula malacoides will soon bloom no more, and all these should have their places filled "by those who in their turn shall follow them." So plant that when the summons comes you will have plenty of material to keep up the procession throughout the season. The best gardener is the resourceful one, whether of flowers or vegetables.

Feed Hydrangeas Now

The large-flowered, or hortensia group, of hydrangeas are now coming into full leaf and should be heavily fertilized. They are gross feeders and while much need not be fed at one time, it is best to give them a dosing every two weeks. If you wish to turn the blossoms blue, try sulphate of iron in the soil. Iron filings from machine shop drills or from blacksmith shop will also aid, as will a mass of rusty nails.

What protection are you giving the birds in your vicinity? You can at least give them a pan of water to drink and bathe in on warm days.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Municipal Inheritance Tax

I have been told that there is a special law or city ordinance by which a certain per cent of the estates of deceased persons is collectable by the city, this outside of the regular inheritance tax.—Subscriber, Keyes.

There is no such ordinance in the city of Los Angeles, nor could there be under the constitution. There is a county administrator who takes charge of the estates of people who die without direct heirs in the county. For this administration we believe there is a certain small percentage charged to the estate.

Mildew—Curled Leaf

Please advise what causes the trouble with roses which are covered with a whitish mildew. The leaves are curling up. Please give cause and remedy for the curling of peach leaves.—Subscriber, Santa Ana.

The trouble with these roses is the ordinary mildew which may be controlled in part at least by the use of flowers of sulphur. Use in powder can or shake over the leaves from coarse-meshed bag. Do this in the morning when the leaves are moist with dew. If the roses are situated where they can get the full rays of the sun further affection may be prevented. The fungus which has already become established on the leaves, however, will not be destroyed. The peach leaf curl is another proposition and its control is effected only by spraying when the trees are entirely dormant. It is too late to do anything with the trees this year. Spray them next February, or before they leaf out, with Bordeaux mixture.

Hubbard Squash

Am told that Hubbard squash cannot be grown successfully in this part of the country because of insects. What sprays should be used?—Subscriber, Lemoore.

We see no reason why Hubbard squash should not be grown successfully in the Central Valley. As to insects, we take it the inquirer refers to the ordinary squash bug, about the only means of controlling which is the liberal use of repellants or else gathering by hand. If the bugs are gathered and destroyed early in the season when they first put in their appearance later control will be comparatively easy. To capture most easily lay boards near vines. The pests hide under these traps in the morning and may be easily captured. Weeds and rubbish which make hiding places should be cleaned up. Also fertilize and water vines freely so as to enable plants to repel attack. Hellebore is a good repellant ,as is gypsum or ashes which have been saturated with kerosene.

Winter Crop

What crop can be planted in September after water is turned out of ditch, which will give some return and may be harvested before the first of March?—Subscriber, Lemoore.

Barley or rye is a good winter growing crop. It may be pastured off and with natural subirrigation or with good rainfall give good return in the form of winter pasturage. With hogs perhaps a better crop would be Canadian field peas.

Flemish Beauty

When coming down Topango Canyon last summer I stopped at a ranch and bought some of the most delicious pears I have ever eaten. The owner said they were Flemish Beauties. Would like to know why they are not more generally grown.—Subscriber, Kansas City.

The Flemish Beauty is one of our most delicious pears and a tree or two for home use will bring much enjoyment. As commercial proposition, however, it is one of the poorest shippers and from that standpoint does not compare at all with the Bartlett. It is also somewhat irregular in bearing.

Greening Potatoes

Noting the article in your issue of March 17 on greening potatoes, please advise if this should be done before cutting or after. In case of treating with formaldehyde for scab should this be done before greening?—Subscriber, Victorville.

The greening and treating with formaldehyde both preceed cutting. Dip in formaldehyde just before cutting.

Pruning Grapes

Have 100 acres of grape vines which have not been pruned. Is it too late? Would they be killed or injured by pruning at this time of the year?—Subscriber, Los Angeles.

The vines will bleed seriously if pruned this late. Fearing there might be injury the question was referred to Prof. Bioletti and he answers:

"Your subscriber need have no fear of injuring his vines by pruning them at the present time. They are much more likely to be injured overbearing poor grapes if he does not prune them, and moreover if he does not prune them, he probably cannot cultivate them, and his vines may die of overbearing without producing a grape fit to harvest. The loss of sap or bleeding is not serious and in fact will be less now than it would be just as the buds commence to swell. There is indeed a slight weakening effect due to the removal of leaves after the shoots have started, so that the sooner the pruning is done the fewer leaves would be removed with a less weakening effect."

Adamson Law

Will you kindly give in your columns the synopsis of the Adamsson eight hour law. — Subscriber, Hot Springs.

As the Adamson law has to do only with railways and a small portion of their employes, only 25 per cent, it would hardly be of sufficient value to agricultural interests to give it, other than to say that it prescribes that for certain employes of the railways the eight-hour day shall obtain and that any additional hours be charged as overtime.

"Some men grow with responsibility while others only swell."

The Genuine FAIRBANKS Scale-1000 lb. Size

Large Platform-Wide Wheels

When you weigh on a FAIRBANKS Scale you don't "guess it's right"—you *know*. Most scales are correct when new, but a FAIRBANKS *stays* correct, because it has Steel to Steel Bearings and Arrow-tip Beam

There's but ONE Caterpillar Holt builds it

THOUSANDS of owners in thirty countries have nothing but praise for the wonderful Caterpillar Tractor—nothing but praise for its design and for the sound mechanical construction of it.

The famous Caterpillar track, plus the steady, powerful, economical Caterpillar motor (built entirely in the Holt shops), plus the best of materials, workmanship and inspection throughout—these have made the Caterpillar the foremost tractor of the world today. Other tractors, lacking one or more of these elements, cannot achieve the same success.

There's only one Caterpillar—Holt builds it. Don't say Caterpillar unless you refer to this tractor.

We will gladly send details on all models.

GREAT SALE

Scotch Shorthorns

Carruthers Farm

MAYFIELD, CALIFORNIA

Wednesday, May 2, 1917

AT 1 O'CLOCK

This will be the

Greatest Shorthorn Sale

ever held in the West from one farm. In this sale will be cows of rarest of Scotch breeding. Such stock can not be bought in the East, as there never before has been Count Avon stock sold at public auction.

There are eight yearling Bulls and Heifers sired by Sultan Mayflower—a bull purchased at the Harding sale by Leslie Smith, to head the Great Meadowlawn herd, which was known all over the United States for its great collection of Shorthorn matrons.

There will be ten Cruickshank Cows in the sale, which will be hard to duplicate in any herd for conformation, smoothness, size and finish.

The yearling heifers and bulls sired by a grandson of Choice Goods are large, smooth and thick, mostly all of Scotch breeding, and ought to please the eye of the most critical judge.

All the cattle are in good flesh, and anyone making a purchase to strengthen their show herds this year will have no trouble to get them in shape by fair time. This is foundation stock, tuberculin tested, and vaccinated for blackleg.

45 HEAD OF HIGH-CLASS

28 Females —SHORTHORNS— 17 Bulls

From the Following Sires:

Count Avon 334946—An International Grand Champion.

Count Glory 426982—Last year's California Grand Champion.

Mayflower Sultan 402251—A grandson of Whitehall Sultan.

Ringmaster 307894—Three successive years Grand Champion of America.

March Knight 188105—America's greatest heifer producer during his lifetime.

Fair Knight 329053—Grandson of Choice Goods and Imp. Fairplay, a Highland Champion.

Visitors will be welcome at the farm any time before the sale.
Send for copy of Catalogue.

The Dairymen's League of New York

Written for California Cultivator By Leroy Anderson

NEW York City consumes more than 2,000,000 quarts of milk daily, and this is produced on about 44,000 farms located in six states. The milk is transported from 50 to 450 miles on more than 250 special milk cars and requires over 6000 wagons for delivery in Greater New York. Taking all the work, an army of 200,000 persons is daily engaged in handling this immense amount of milk.

Prior to last October the milk dealers set the price to both producer and consumer, but then an organization known as the Dairymen's League stepped in and had something important to say about the price to the producer. Prices were then fixed for the six months beginning October 1, 1916. During the last month (March) prices have been agreed upon for the six months beginning April 1, 1917. Having won its first big battle last fall the Dairymen's League now is received in conference by the dealers and prices adjusted to the satisfaction of both parties.

The league started in a small way in 1907 with a few farmers in Orange County. In 1910 it had grown to larger proportions and was incorporated under the laws of New York. During these years the league's efforts were chiefly educational and no concerted effort was made to fix prices until the summer of 1914, then a committee was sent to New York to confer with the dealers, but the latter refused to treat with the league. Owing to the war and other disturbing economic conditions the time did not seem ripe for drastic action.

In June, 1916, the league directors met in Albany and decided to institute a strike if the dealers would not come to terms. The dealers gave the league no alternative except to fight, and encouraged by the success of the Chicago milk producers in the preceding spring the directors proceeded on the fight basis.

CLOSE OF ENTRIES IN STATE DAIRY COW COMPETITION

DAIRYMEN and breeders of dairy cattle who are considering entering cows in the state dairy cow competition are reminded that entries close May 1. Nearly 100 prizes, varying in value from $300 to $10 each, are offered for records of production, the aggregate value amounting to nearly $8000. More than one half of this amount will be awarded to grade and common cows. It will be well worth the effort of any dairyman who owns good cows to enter these in the competition, on account of the prizes they may win, the knowledge that will be gained as to the value of the individual cows, and the advertising that will be received through the publication of good records of production in the herd.

Members of cow testing associations may compete for the prizes offered for yearly herd records without extra expense, and at greatly decreased cost for prizes for individual cows and groups of cows in their herds. The complete list of prizes with copy of the rules will be found in Circular 153 of the College of Agriculture, which may be secured upon application to Director Experiment Station, Berkeley. Further information and entry blanks may be obtained from Professor F. W. Woll, University Farm, Davis.

"More and Better" is the watchword in every department of agriculture, and while dairymen for several years have been working to this end through cow testing associations, breeders and marketing associations, the duty is still more imperative because of war conditions.

Let every member of cow testing associations keep in mind the offer of the California Cultivator of three prizes of $100 each to dairies, members of cow testing associations, which make best records during the 12 months.

Entries will positively close Tuesday, May 1. This is little more than a week now and calls for immediate action. Write at once to Prof. Woll for necessary blanks.

Long Pedigreed Shorthorns

Written for California Cultivator By C. A. Briggs

Mayflower, Property of W. M. Carruthers

In green pastures in fenced yards and well kept barns on the Carruthers farm at Mayfield are about a hundred head of sleek cattle. The lordly herd sire, Count Glory, has stamped his individuality on the young stock and they promise much for the herd's future. Forty-five head are to be sold at auction on May 2 and go to build up the herds of other breeders in the state and on the coast. Mayfield Knight, a young bull bred on the place, red in color, is an especially fine specimen. He was calved March 1, 1916, and is large and well developed for his age. A roan, Sultan Twinkle, of about the same age and size is perhaps equally good. Sixteen others promise well in every way and are all worthy to be sires of good herds. The cows offered are individuals of much merit. They show good breeding and are in excellent condition.

The selection made for the sale includes many of the choicest animals in the herd. Col. Carey M. Jones, a Shorthorn auctioneer, will cry the sale. A lunch of good things will be served under the oaks, and if many come many will be fed. This will be the first auction sale of registered Shorthorn cattle ever held in the state and will mark a red letter date in California's beef cattle history.

WILLOWWOOD HERD OF

Registered Jerseys

contains 13 Register of Merit cows and heifers with yearly records averaging 516 pounds of 85 per cent butter.

Practically every heifer in the herd is a daughter of a Register of Merit cow.

You men and women who own Jerseys know what it means to have such cows and heifers.

You may buy them at your own price when we sell at public auction, to the highest bidder, absolutely without reserve or limit, the entire Willowwood Herd of

60 REGISTERED JERSEYS
owned by C. G. McFarland

Tulare, California
on Thursday, May 17, 1917

This sale will be a rare opportunity for established Jersey breeders to strengthen their herds.

Individual tuberculin test certificate with every animal over six months of age.

Salt for Stock

Highest authorities on animal feeding in both America and Europe recommend plenty of salt for stock.

We sell MORTON'S SALT BLOCKS, pure salt compressed into hard blocks under great hydraulic pressure. No waste, cheap, easy to handle, no mineral particles. Cattle and horses like it. We also sell Pure Lump Rock Salt and bulk commercial salt for mixing with hay.

If your dealer cannot supply you, write for prices. To anyone interested in salt for stock we will send free of cost a neat instructive booklet on THE RELATION OF SALT TO STOCK FEEDING, written by a well known Western authority.

Try a sample shipment.

Fuller, Leighton & Stratton
WHOLESALE SALT
615-617 E. 3rd St., Los Angeles, Calif.

HOOD FARM BREEDING POWDER

Makes barren cows and mares breed readily; destroys germs of abortion; causes cows to come in season; makes cows clean without force; stops unhealthy discharges; has been used with marvelous success by thousands of breeders. Guaranteed to cure barrenness if a cure is possible. We want you to try it. Advice free.

Prices prepaid $1.15, $2.75 and $5.00. Flexible Injection Tube 90c., or with $5.00 order 75c. Order now, mentioning this paper.

Dependable Sales Service

¶ We offer an unexcelled service for the conduct of dispersal and consignment sales of registered livestock. Sales conducted anywhere. Write for terms and dates.

California Breeders' Sales and Pedigree Co.
C. L. HUGHES, Sales Mgr., SACRAMENTO, CAL.
Col. Ben A. Rhoades, Auctioneer, Los Angeles

Organizers were put into the field and met with much encouragement from producers. A strike was ordered to begin October 1, the directors advising that it be conducted with moderation in relation to non-cooperating dairymen. However in many localities some milk was spilled and unruly dairymen otherwise taught to respect the merits of cooperation. Very little milk found its way into New York City. The strike lasted 14 days before the big dealers gave in. Several small dealers capitulated in seven days and thereby secured milk formerly purchased by their big rivals. Cooperative milk depots that had almost died came to life and now in a few villages the big dealers' plant is gasping for breath and seeing the cooperative handling nearly all the milk. The cooperative plants are now consolidating with a view to more profitably selling their product in the city.

The Dairymen's League covers all of New York state and parts of Pennsylvania, New Jersey, Connecticut, Massachusetts and Vermont, or all the district supplying milk to New York City. The membership fee is 25 cents per cow and a commission of one cent per 100 pounds for selling the milk. This money furnishes the sinews of war for the league. The government is vested in 24 directors elected from as many districts and representing the entire territory. The directors are authorized to sell the milk and no member is at liberty to sign any sale contract not approved by the directors.

The league realizes that public opinion as to the cost of producing milk and the food value of milk is a valuable asset in fighting the producer's battles. The public is being educated through advertising, and in March the sum of $17,000 was spent through New York City dailies. During the summer the advertising campaign is to be carried to the larger up-state cities, like Albany, Buffalo and Rochester.

The following schedule of prices shows what has been gained by the league as compared with the preceding year. The prices are per 100 pounds of grade B milk and in the first zone, or within 100 miles of Greater New York:

Price for 100 lbs. of 3 per cent milk.

	Year Beginning Oct. 1, 1916 League	Year Beginning Oct. 1, 1915 No League
October	$2.15	$1.71
November	2.25	1.81
December	2.25	1.81
January	2.20	1.71
February	2.15	1.66
March	2.10	1.56
April	2.05	1.36
May	2.00	1.06
June	1.90	1.01
July	2.10	1.26
August	2.55	1.41
September	2.55	1.46

Milk produced more than 100 miles from New York is considered in the second zone and producers receive 10 cents less per 100 than the above. Grade A milk receives 15 cents more per 100 and grade C milk 10 cents less per 100 than above prices. Milk testing over three per cent fat receives in addition to above prices three cents per 100 pounds for each one-tenth per cent increase in fat, up to March 31, 1916. Since that date the differential has been increased to ½ cents, another result of league endeavors.

The league is on a firm basis and dealers like to do business with it. Some smaller dealers are volunteering to pay non-league members ten cents less per 100 than members, another boost for membership. The league has been growing all winter at the rate of 60 locals per month. At present writing (April 1) the membership is approximately 36,0000, representing 440,000 cows.

Skim milk should always be used when it is available. It is not only a good flesh producer in itself but it also makes the ordinary grain feeds more digestible and so adds greatly to their value. While skim milk alone is rarely profitable, from 20 to 40 pounds being required to make a pound of meat, when mixed with grain in the proportion of three pounds to one pound of grain its value is greatly increased. Skim milk is worth about 30c per 100 pounds when used in the proportion above given.

20 well bred Heifers and A. R. O. Cows in calf to a 34 pound grandson of King of the Pontiacs.

15 granddaughters of Prince Gelsche Walker, sire of the new 34 pound junior 4 year old California champion.

These are only a part of the choice ones that we will sell for

Rosamond Farm

Stalder Bros.
RIVERSIDE, CALIFORNIA
TUESDAY, MAY 22, 1917

when the total offering will consist of

60 REGISTERED HOLSTEINS
16 REGISTERED PERCHERON STALLIONS, MARES, COLTS.
20 GRADE HOLSTEINS and JERSEY HEIFERS.

This sale is the place to buy top Holsteins and Percherons, and they go at your price, absolutely without reserve or limit.

The offering of registered Holstein bulls is of exceptional quality. It contains:

A son of a 34-pound cow sired by a son of Prince Gelsche Walker out of a 28-pound daughter of a 30-pound cow that held the world's record for milk production for one year.

A son of a 28.91-pound cow sired by the same son of Prince Gelsche Walker as above.

Five sons of a 34-pound sire and out of good dams.

Catalog in preparation. Write for one.

Elliott-Brant Rancho Guernseys Are Persistent Producers

The results of our first two years of official testing show our herd to average 10,172.28 Pounds of Milk and 507.97 Pounds of Fat. One half of these cows were heifers with first calf who averaged 8,670.24 Pounds of Milk and 436.01 Pounds of Fat (only 7 pounds under the average of all A.R. records). Our mature cows averaged 12,710.5 Pounds of Milk and 621.52 Pounds of Fat (120 pounds over the average of the mature cows of the breed).

A bull from these cows will increase the production of almost any herd.

Elliott-Brant Rancho, - Owensmouth, Cal.

BERKSHIRES

A few fine fall pigs, strong in Bandmaster, Masterpiece and Rival's Champion blood. They are strong and active with good top lines, heart girth and moderate heads. Glad to show them or send full particulars and prices.

The Remco Redwood SILO

will enable you to furnish your cows with SWEET, GREEN FEED during the LONG, DRY SEASON.

To have desirable feed means more and better milk with higher prices and a larger income. It is not only economy but sensible business judgment to provide your ranch with a REMCO REDWOOD SILO.

It will more than pay for itself every year and will last a life time.

CONSTRUCTION

The REMCO REDWOOD SILO is made from clear air dried redwood. It is built according to scientific specifications by skilled mechanics using the most approved wood working machinery.

TANKS and PIPE

We also manufacture REMCO IRRIGATION PIPE in all dimensions from two inches to twelve feet in diameter. Water tanks from 500 to 500,000 gallons.

Write us for our instructive booklets on any of the above subjects.

Northern California Live Stock Notes

Written for California Cultivator By W. S. Guilford

COOPERATIVELY OWNED SIRES

ONE of the greatest Percheron stallions in the world is owned by two farms, and he does duty in two different studs. One farm is in Illinois, one in Indiana. One-half interest in him was sold for $10,000. This stallion is the famous Carnot.

The same principle will work in the neighborhood ownership of bulls and boars and rams—if the neighbors can agree and will see the thing in the right way. Take a locality where there are 30 pure bred sows for instance owned by five different owners. A man with six sows might not think he could afford to buy a $500 boar; one costing $100 might be about his limit. But every pig sired by the $500 boar should easily be worth $5.00, maybe $10, more than those sired by the cheaper one.

Now it would surely be worth something in the way of give and take neighborliness, and little inconvenience, to accomplish this result. This is a matter worth considerable thought.

SAVE ALL THE HAY THIS YEAR

In the districts where irrigation is available there are many fields that do not raise nearly as large a total tonnage as they should. Sometimes the time of cutting the crop is delayed a few days, then this makes the irrigation late, and by the end of the season one delay or another has caused the loss of at least one full cutting during the season.

We need every pound of hay that can be produced in 1917.

HAUL THE MANURE

Every forkful of manure should be hauled out this spring and put where it will do the most good. Only in this way will the maximum production of the individual farms be obtained.

MORE IRRIGATION

The state water commission, consisting of the governor and W. F. McClure, W. A. Johnstone, A. E. Chandler and Irving Martin, has just issued report for the period from March 15 to December 1, 1916. It gives an idea of the progress which is being made in irrigation development of California. There will be millions of dollars spent for labor within the next few months.

The book contains not only a number of tables giving a mass of information regarding irrigation matters of the state but has chapters touching methods of application for permits to appropriate water, also a chapter on water rights in California, dealing with riparian rights and present practices. It is a most valuable book and should be in the library of every California irrigator.

A Great Sire

THE live stock men of the Coast opened mouths and stared when Mr. Taylor, manager of Mrs. Baldwin's great Santa Anita Rancho, paid the Morrises $12,500 for Prince Gelsche Walker. It seemed a long price. As new daughters enter the A. R. O., and now as Miss Valley Mead De Kol imported cow Hiske 24th. Juliana King of Riverside is out of former world's record two year old, Juliana De Kol. He has sired a number of cows that have produced over 1000 pounds of butter in one year and is also grand sire of the only cow in California to produce over 35 pounds of butter in seven days. He now has 25 A. R. O.

Lady Hiske Walker

Walker proves a world beater, his real worth becomes more apparent.

Lady Hiske Walker No. 197489, another daughter of the famous Santa Anita Rancho herd sire, Prince Gelsche Walker, has just finished a seven day record of 34.246 pounds of butter from 600.3 pounds of milk. This gives her the state record for California as a Junior four-year-old. She formerly held the state record as a three-year-old with 25.61 pounds of butter from 579.7 pounds of milk. At two years she produced 19.70 pounds of butter from 447 pounds of milk in seven days.

Lady Hiske Walker's dam, Hiske of Riverside, made 26.68 pounds of butter in seven days and 711 pounds of butter in one year. She is the daughter of Juliana King of Riverside and the daughters, this cow being the first to freshen as a four year old.

Miss Valley Mead De Kol Walker another daughter, produced 25.68 pounds of butter from 533 pounds of milk in seven days as a two year old. She produced 102 pounds of butter in 30 days and 754 pounds of butter in 240 days. At eight months after calving she produced 21.33 pounds of butter from 404 pounds of milk giving her the world's record in that class. She holds the California state record as a two year old.

Prince Gelsche Walker's daughters have carried off nine of the California state records. This remarkable young sire and 30 of his daughters are owned by Anita M. Baldwin, Santa Anita Rancho.

Field Notes From the Live Stock Men

Thatcher, Ennis & Williamson announce a sale of pure bred Berkshires the second week in May.

C. E. Patterson, Red Bluff, has recently purchased 20 Poland-China gilts from S. F. Williams of Orland.

The California Holstein-Friesian Association met at the Hotel Hughson Modesto, on Wednesday evening April 18. An interesting program was prepared. On the 19th the Holsteins of the Cornwell herd were sold at auction. More next week.

DUROC JERSEYS

Sows, gilts and a few boars of the best breeding FOR SALE

H. P. Slocum & Son R 1 Willows, Cal.

H. I. Marsh of Sandyacre Farm reports sales of Poland-China hogs as follows: A yearling boar to Fred Hartsook, Los Angeles County, and a 14 months' old boar sired by "Model Major" to Miller & Lux, Inc., and two boar pigs to Roy Willison of Mazatlan, Mexico, and also nine open and bred gilts to this same gentleman.

The J. S. Gibson Company's Holstein cow, Princess Jetze, has completed a seven-day test which records 30.1 pounds butter, 485.4 pounds milk, showing 4.96 per cent fat. She is the best daughter of Jetze Zwartha, the bull that was imported for the old Pierce herd from Holland at a cost of $5000. He was an undefeated show bull in both the United States and Holland.

President Keisel of the California Holstein-Friesian Association writes of the active campaign which is now being conducted for the advancement of the Black and Whites. A committee has been appointed to revise the by-laws of the association. This committee consists of Frank M. Helm, Fresno; A. R. Magruder, Ripon; W. H. Taylor, Santa Anita; Gion W. Gibson, Williams; A. W. Morris, Woodland; Owen Duffy, Napa, and J. M. Henderson Jr., Sacramento. This committee met with the president and the by-laws have now been revised. The association is in shape to begin putting in action its plans for the advancement of the interests of Holstein cattle in California, and needs in this work the cooperation of every breeder and dairyman in the state, together with the cooperation of all others who are interested in any way in the betterment of the entire dairy business.

Guy H. Miller reportes recent sales of the following young Jersey bulls: Baron Constantia 149821 to F. N. Hale. Baron Constantia is a typey youngster sired by Baron Underwood. His dam, Constantia of Venadera, is a two-year-old heifer now on yearly test doing good work. She is a daughter of Owl of Belleview, the university farm bull, and her dam is old Signora Bruce, R. M., 573 pounds butter, grand champion state fair 1908.

"Sergeant Altama 149822 to F. E. Robertson. He is sired by grand champion Altama Interest, sire of eight R. of M. heifers. His dam is Beatrice of Venadera, R. of M., 532 pounds of butter.

"To J. H. Holgate, yearling bull, Juanita's Interested Fox 141536, son of Altama Interest, dam, Juanita of Venadera, 628 pounds butter. She is another of the tested daughters of Margery Golden's Fox. Her dam, Wanda of Venadera, 609 pounds butter, is dam of three R. of M. daughters. Wanda's dam, Anita of Venadera, R. of M. 518 pounds butter as a three-year-old, is dam of seven R. of M. daughters. Anita holds world's record for number of R. of M. daughters with yearly records, Anita's dam, Nettie Underwood, is in R. of M., 668 pounds butter and is dam of three R. of M. daughters. Juanita's Interested Fox was a prize winner at the last state fair.

Toyon Farm, Los Altos, is progressing rapidly in the development of its herd of registered Holstein-Friesian cattle. The foundation was selected with high requirements as to breeding and individuality, and the beginning of official testing promises records that will be a distinct benefit to the breed. Recent creditable seven-day official records completed include: The three-year-old Finderne Soldene Korndyke, 21.25 pounds butter; the three-year-old Miss Wayne of Yuba, 25.33 pounds butter; Creamcup Colantha De Kol, 27.86 pounds butter, record made after a double case of milk fever; and the exceptionally good record of 27.90 pounds butter by the three-year-old Tulista Johanna Princess. She went on test right out of pasture, with absolutely no preparation, and barring accidents she is a sure 30-pound cow at next freshening.

W. J. Higdon, the popular Holstein and Guernsey breeder of Tulare, has just sold his entire herd of registered Guernseys and will hereafter devote his energies toward developing his registered Holstein herd. The Guernseys sold are one of the very choicest herds in the West, the females consisting of practically all three-year-old heifers with Advanced Register records around 400 pounds fat in one year. Mr. Higdon's Holstein herd is made up of well bred cows, many of which have high A.R.O. records, and these females are headed by a sire of

The 100% Silo

is the silo that's built of California Redwood. Think up all the good points a silo material should have—you'll find *every one of them* in

California Redwood

Resists rot and fire

Permanent—contains a natural preservative that prevents decay. Not affected by sun, rain or violent changes of weather.

Will not shrink, warp or swell, when properly seasoned.

Non-conducting—Redwood retains the heat necessary for perfect fermentation of silage, keeps out cold, prevents freezing.

Fire-resistant, because non-resinous.

There are many other important advantages of Redwood for silos—in fact for *all* exterior and interior building construction. "California Redwood on the Farm" contains the whole story. Ask us for it. It's free.

If your local lumber dealer does not carry Redwood send us his name and we will arrange for him to get it for you.

Ask for the Child's Story of the "Big Trees" of California—there's a copy for every child in the nation.

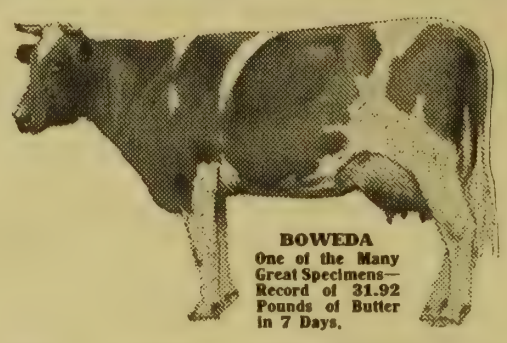
VINA CALIFORNIA, June 5, 6 and 7, 1917

America's Greatest

Holstein Auction



BOWEDA
One of the Many Great Specimens—Record of 31.92 Pounds of Butter in 7 Days.

The Board of Trustees of Leland Stanford Jr. University has decided to dispose of the entire herd of about 300 registered pure bred Holsteins on the Stanford Ranch at Vina, California, at public sale, June 5, 6 and 7, 1917.

The foundation for this world famous herd was laid by the late Governor Leland Stanford in the early 80's; and, by the intelligent introduction of new blood strains, it has been developed to a point where it is without a peer. The value of this great herd has been proven in the last year by the most successful official tests.

Cows of wonderful capacity and bulls of character have been developed at Vina.

The herd will be auctioned without reserve. This will be an unequaled opportunity for the advanced breeder, the beginner and the dairyman.

At each drop of the hammer somebody's herd will be improved.

There are more good prospects in this sale for A.R.O. work than ever before offered. Cows with big records. 40 A.R.O. cows are to be sold.

300 Registered Purebreds Tuberculin Tested

In the herd are:

40 daughters of King of the Pontiacs 14th. 84332, best individual son of King of the Pontiacs and one of the greatest show bulls in the West.

20 heifer calves of Segis De Kol Pontiac Burke 160339, all great prospects.

40 daughters of Dutchland Colantha Sir Ormsby 55055, a great son of Colantha Johanna Lad, all making good records.

Geneseo Lad 90356 and 40 very promising daughters.

Special trains will be run between Chico and Vina each day of sale.

Announcement

Knob Hill Stock Farm

Registered Poland Chinas

To My Friends and Patrons:

I have sold my aged herd of Poland-Chinas to H. I. Marsh of Modesto, Cal., which he will combine with his Sandyacre Herd. Mr. Marsh is a well known Poland-China breeder and requires no introduction.

This combination will give Mr. Marsh one of the largest and best herds of Poland-Chinas in the state. I bespeak for him a continuance of your liberal patronage and friendship, for which I thank you.

Farmington A. M. Henry California

outstanding breeding and individual excellence. Prince Riverside Walker, whose sire is the famous Prince Gelsche Walker and whose dam is Aaggie Acme of Riverside, the dam of Aaggie Acme of Riverside 2nd, the wonderful young cow now making remarkable records in the Morris herd.

A. M. Henry, the Poland-China swine breeder, announces that he has sold his aged herd of Poland-Chinas to H. I. Marsh, a Stanislaus County breeder. Mr. Henry writes that he hopes for an extension of the good will toward Mr. Marsh which has been shown to him in the many years he has been growing prize winning Poland-Chinas. Mr. Marsh will have a magnificent herd, and we doubt not the skill which he will use in building it up into a bigger and better will make for a continuation of the popularity of this great herd. These animals are all of the large type and have been shown at state and other fairs for many years. We do not know whether the blue ribbons have all gone with the herd, but blue ribbon winning capacity has, and we will expect to see Mr. Marsh at future state fairs.

W. E. Premo, manager of the Porterville Alfalfa Company, has contracted with the Prosperity Alfalfa Company for the delivery of 1000 corral fed cattle within 30 days at a price of $120,000. This is said to be a record figure.

Alexander & Kellogg of Innisfail Farm, Suisun, report "sale of two bull calves last week, one out of an imported heifer to C. J. Kingry and the other out of an eastern cow to A. G. Watkins. As there is to be a classification for Milking Shorthorns at the Chico fair in May we will show a representation from our herd there, including our herd bull, Glenside Royal, and two imported English cows, Bellvue Daisy, who won the silver cup at the Solano County Fair last year, has just completed her year's record of 8468.7 pounds milk and 311.67 pounds butterfat. In addition to this she suckled her calf for a month before beginning the record. Her heifer calf weighed 880 pounds as a yearling. We consider this a good demonstration for the dual purpose cow. We have a four-year-old cow that is now milking 50 pounds a day on dry feed. She has a fine roan bull calf that we will show at the state fair."

Thatcher, Ennis & Williamson announce a Berkshire sale to be held May 9. "The catalogue shows names of two sows that are as well known as any other sows on the coast. They are Rookwood Lady 96th and Rookwood Lady 97th. In breeding and individuality they stand in the class of truly great sows. Rookwood Lady 96th won first and grand championship honors at the Riverside fair, the largest live stock show in Southern California, in both 1915 and 1916, and was second in the junior yearling class of 37 entries at the Panama-Pacific International Exposition, and she is better today than she ever was. She is a sure breeder and transmits her qualities to her pigs. Rookwood Lady 97th was in the Berkshire View Herd at the P. P. I. E. as a representative of the ideal Berkshire sow."

A GREAT BOAR

A. B. Humphrey, one of the most enthusiastic Berkshire breeders of the coast, holds the record as to price received for one boar. At the time of the Panama-Pacific Exposition and on one or two other occasions $1000 has been paid for California bred stock, but now Mr. Humphrey puts Grand Leader 2nd—which by the way was grand champion at the P.P.I.E.—in the ring and he sells for a round $3000. Worse than all, from the California standpoint, is the fact that the purchaser also takes away 20 sons and daughters of the champion, carrying the whole bunch back to Pennsylvania. It is to be regretted that such a great family of hogs has been sold out of California.

A question frequently asked is; "What breed of hogs should I take up?" All breeds look alike to the packer, provided they are well matured and properly conformed. Neither the Duroc, Chester White, Poland-China, Berkshire, Hampshire, Yorkshire brings a premium one over the other, provided the grade and finish are the same. That being the case raise the breed that your fancy dictates.

CUTTER'S
BLACKLEG PILLS

"California's Favorite" for nearly 20 years

For the Prevention of Blackleg in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest.

Prices:

10 dose pkge. Single pills	$1.00
50 dose pkge. Single pills	4.00
10 dose pkge. Double Pills	1.50
50 dose pkge. Double Pills	6.00
Cutter's Pill Injector....	1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

G. A. Murphy - Perkins, Cal.

BREEDS OF SWINE

The Department of Agriculture, Washington, D. C., is issuing Farmers' Bulletin 765, "Breeds of Swine," by F. G. Ashbrook of the Animal Husbandry Division.

There are two distinct types of swine, the lard and the bacon types. Swine of the lard type far outnumber those of the bacon type in the United States. The lard type is preferred by the people of this country, consequently the majority of feeders produce the rapid fattening, heavily fleshed lard type.

The bacon type is not raised extensively in the United States. The production of choice bacon is more general in those countries where the feed of the hog is more varied and where corn is not relied upon as the principal grain for hogs.

The principal breeds of the lard type are the Poland-China, Berkshire, Chester White, Duroc-Jersey, and Hampshire.

The principal breeds of the bacon type are the Tamworth and the Large Yorkshire.

There is no best breed of swine. Some breeds are superior to others in certain respects, and one breed may be better adapted than another to certain local conditions. This is a matter which the farmer will have to decide for himself.

BIGGEST SALE OF PUREBREDS EVER HELD

On account of the great diversity of the interests of the trustees of the Leland Stanford Junior University they have decided that it will be to the advantage of all concerned to concentrate the resources of the university and thus make administration safer and easier not only now but for the future.

The sale of the entire herd of pure bred registered Holstein cattle on the university ranch at Vina will be the first move under this new policy. About 400 head will be sold on June 5, 6 and 7 under the direction of M. H. Tichenor as sales manager. Tichenor is one of the owners of the Palo Alto Stock Farm, the home place of the late Governor Stanford, and is recognized as one of the best authorities on registered cattle in the United States. In the early 80's Governor Stanford founded the herd and it is one of the best and most interesting in the world.

STANISLAUS COUNTY SWINE BREEDERS

The Duroc-Jersey Swine Breeders' Association of Stanislaus County held its regular meeting at Modesto, Saturday, April 7. J. M. DeVilbis of Patterson, vice president, presided. Mr. C. H. Connor, county farm adviser, gave a talk on "Food Values of Farm By-Products." He showed us how we can cheapen our hog ration by utilizing the waste products such as sweet potato culls, cantaloupes, pumpkins, skim milk, etc. He showed how the skim milk which is being sold to the casein factories at 18 to 20 cents per hundredweight, if fed to hogs would displace grain to the value of 40 to 60 cents. At the next meeting W. M. Way will talk on "Cooperative Marketing of Hogs." It is the purpose at each meeting to discuss some subject of vital interest.—Elmer Lamb, Secretary.

RAPID INCREASE IN BUTTER MAKING

Written for California Cultivator
By C. A. Briggs

The Orland cheese and butter factory is rapidly coming to the front as a producer. Beginning in 1915 in a small way it did a $193,000 business in 1916. In February of this year the output was 100 per cent above that of the corresponding month of last year. In March an average of 2300 pounds of butter was produced every day of the month, including Sundays, and the pay checks for the month to the farmers amounted to over $20,000.

At the Western Dairy Products Show in Portland, Oregon, just closed the factory's exhibit of butter won a "Highest Score" bronze medal. The entire output finds a ready sale at best prices.

HERCULES
JUMBO-RIVETED
HALTERS

LIKE everything else in the *Hercules* line, the Halters are made to last, to give good service, to wear well, and always to be relied upon in an emergency.

Those Jumbo Rivets have a quality all their own. The heavy halter is oak-tanned in California, the source of the best harness leather.

They are so strong we could almost afford to offer to pay for a new horse, in the event that one of these Halters broke; but we will give you a new halter if one breaks under ordinary usage.

Ask your dealer for *Hercules* Halters.

When a dealer offers you a *Hercules* Harness, Horse Collar, or Saddle, he is offering you *THE BEST THERE IS*

Public Sale **Berkshires** Public Sale

Wednesday, May 9, 1917
RIVERSIDE, CALIFORNIA

60 Bred Sows and Gilts
10 Boars - 50 Weanling Pigs

DISSOLUTION OF PARTNERSHIP

An Opportunity for the breeder who is after the best in type, quality and breeding for his foundation herd. An Opportunity for the man who wants young stock. An Opportunity for the man who wants animals for his 1917 show herd. An Opportunity for the man who is after the right kind of pure-bred Berkshires in his herd for profitable pork production. There isn't a breeder on the Coast who will not find something in our offering that will attract him, that will add strength to his herd, and that he can afford to buy. Come and bring your friends with you. Remember the time and place. May 9th, at Riverside. Write for catalogue.

Thatcher, Ennis & Williamson

ABORTION IN CATTLE
PREVENTED AND CURED PERMANENTLY
YOUR COWS MADE PROMPT, REGULAR BREEDERS BY
STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion, the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. Price $1.00. Mailed postpaid, in plain wrapper.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Lump Jaw

A swelling came on the side of the jaw of one of my cows and has formed a hard lump about the size of a hen's egg. The tongue is swollen also so that it is difficult for her to eat. She slobbers when eating. I think some of the other cattle are getting the same trouble. Is the disease contagious and what can be done for it?—Subscriber, Brockman.

Probably it is lump jaw (actinomycosis) which is caused by a germ or fungus that gets into the tissue through a wound. The fungus is found on hay and grain and is supposed to get into the gums while the animal is eating. The disease seems to thrive best in the tissue of the bones. It is very seldom that more than one animal is affected with it in the same herd. The milk is probably all right as there are no records of persons having taken the disease from using the milk. Following are two prescriptions that are the best known for curing it and unless the bone is too badly affected will do the work.

No. 1. Iodide of potash, two ounces and water enough to make one pint. Mix and give one ounce on the tongue once a day. Get an ounce bottle that will hold the dose and pour it well back on the tongue.

No. 2. Iodine crystals, one dram; tincture of iodine, two ounces and enough lard oil to make four ounces. Mix. Apply to the lump once a day.

It might be well to repeat the first prescription in a month or two.

Bloody Urine

Please tell me the cause of bloody urine in small calves and what you would advise giving them.—Subscriber, Porterville.

Bloody urine may be due to any one of many causes, as eating a poison weed, drinking water from stagnant pools in a lowland pasture or from eating musty hay. Change the feed and water and give a handful of epsom salts to empty the bowels. Give flaxseed tea by pouring a gallon of boiling water on a handful of flaxseed and when cool let the calf drink it. Give the flaxseed tea once a day. If they are run down and you think they need a tonic give them powders made of gentian, four ounces; sulphate of iron, one ounce and farina, six ounces. Mix. Divide into 40 powders and give one powder once a day.

Rheumatism in a Dog

We have a dog that has been ailing for some time. His hind legs tremble most of the time and he eats very little. He walks about the place and at times when running will fall down. It first seemed to be rheumatism.—Subscriber, Escondido.

Probably it is rheumatism but may be the result of worms. Get salicylate of soda, one dram; bicarbonate of soda, one dram; gin, one ounce and enough water to make four ounces. Mix. Give a teaspoon of the medicine once a day for a medium sized dog or half the amount if the dog is small. To make sure that the trouble is not kept up by worms get ten powders of areca nut, each containing ten grains, and give one every morning, while they last, mixed in a little milk.

Worms in Hogs

Please tell me in the Cultivator what to feed hogs for worms.—Subscriber, Los Angeles.

Give each one a teaspoon of powdered areca nut in a pint or less of milk every morning for a week. Half an hour after giving the medicine give their regular feed.

MARCH REPORT OF SAN JOAQUIN COUNTY COW TESTING ASSOCIATION

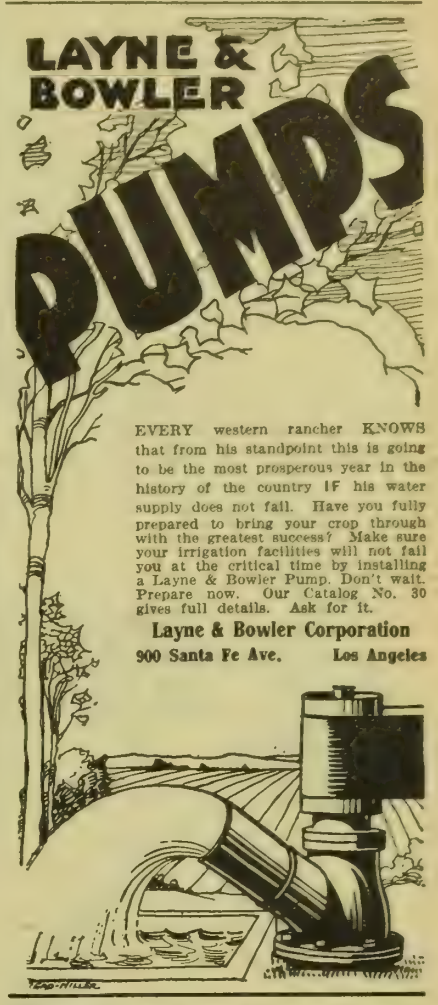
The herd averages in the association are gradually climbing, due in part to the coming of better weather, and to better feed as well as an increased effort on the part of dairymen to secure greater production. Attention is called to the fact that all of the five leading herds for March have an average of 30 pounds of butter fat, or one pound of butter fat per day per cow, or better. The average obtained by the leading herd is the highest that has so far been recorded in this association. This only goes to show what can be done with care in feeding and management, the selection of a herd by making use of records, and the elimination of poor producers.

Following is a list of the five leading herds in milk and butter fat production for March, with name of owner, number in herd and pounds milk: F. J. Kell, 15, 1347; M. N. Yokum, 23, 846; County Farm, 30, 835; E. B. Goodwin, 60, 833; M. C. Gammon Estate, 27, 826.

Following is a list of cows producing 50 pounds of butter fat, or over, with name of owner, breed of cow, pounds milk and pounds butter fat. Besides these there were 19 cows producing over 45 pounds of butter fat during the month.

F. J. Kell, H., 2737, 84.8; F. J. Kell, H., 2061, 84.5; F. J. Kell, H., 2172, 78.2; N. H. Locke Co., J., 1311, 76.0; F. J. Kell, H., 1857, 70.6; F. J. Kell, H., 1779, 65.8; E. B. Goodwin, H., 1280, 61.4; N. N. Locke Co., J., 918, 56.9; County Farm, H., 1602, 56.2; F. J. Kell, H., 1642, 55.8; F. J. Kell, H., 1141, 55.7; N. H. Locke Co., J., 973, 55.5; N. H. Locke Co., J., 967, 55.1; E. B. Goodwin, H., 1370, 54.8; S. Gronner, H., 1421, 54.1; M. C. Gammon Estate, H., 1104, 54.1; County Farm, H., 1389, 52.7; E. B. Goodwin, H., 1116, 51.3; N. H. Locke Co., J., 1117, 51.3; E. B. Goodwin, H., 1443, 50.5; Barngrover & Wright, J., 1045, 50.2; H. Bailey, H., 1162, 50.0.

LAYNE & BOWLER PUMPS



EVERY western rancher KNOWS that from his standpoint this is going to be the most prosperous year in the history of the country IF his water supply does not fail. Have you fully prepared to bring your crop through with the greatest success? Make sure your irrigation facilities will not fail you at the critical time by installing a Layne & Bowler Pump. Don't wait. Prepare now. Our Catalog No. 30 gives full details. Ask for it.

CREATION

Did you ever stop to ponder
Why the stars are in the sky,
Why the moon lights hill and valley,
Why the clouds roll gently by?

Do you know who makes the thunder,
Makes the little rain drops fall,
Makes the lightning flash so brightly,
Makes the sea tides rise and fall?

Can you tell me what the air is,
What makes water taste so good,
Why a seed that you have planted,
Grows and soon becomes a food?

Do you know who made the mountains,
Do you know who made the sea,
Why a tiny acorn planted
Grows to be a mighty tree?

Do you know what makes the heart ache,
And again with joy is filled,
Why sometimes its beats are faster
In the end by death is stilled?

Have you ever seen the rapture,
Gleaming in the human eye,
Or beheld the flowing tear-drops,
By sorrow, forced to cry?

Can you look into the future,
Tell what it will bring to you,
Fathom why some men are heartless,
Other men are good and true?

You do know there is a heaven,
You believe this without doubt.
He gave the world these many things,
For each one to think about.

—W. Rankin Good.

MORE VALUE, LESS COST

REDUCING the cost of food while keeping up its value is the big problem of the day for us all. New clothes we can do without; new food we must have. More milk, more eggs, more cereals in the diet will cut expenses and add to the healthfulness of the family.

One way to reduce the cost of food for the family, say the specialists of the United States department of agriculture, is to use more corn meal, where this is low in price as compared with other cereals.

A dish of mush and milk has made the greater part of many a supper on the farm, and children thrive on it, though they may rebel at cleaning the kettle and the "pudding spoon" afterward, if the old-time methods of cooking it are followed. It is a simple dish to make, just 3½ cups of water and a teaspoon of salt to every cup of meal. The water can be put in cold and the vessel heated gradually. A double boiler is very convenient in cooking corn meal mush, as well as all other cereals, and is easier to clean. The great secret of good mush is long slow cooking, the longer the better. A fireless cooker, in which the cooking can go on all day or all night, is very useful for this purpose.

For "quick action" in getting breakfast in the city flat, the corn meal and salt may be put in the double boiler, mixed with a little cold water, and then hot water may be added up to the required amount. If clean hot water is to be had from the spigot, a good corn meal mush can be made in three-quarters of an hour. But corn meal can hardly be cooked properly in less time.

Corn meal mush can be used in many other ways besides as a breakfast or supper dish. Fried mush, mush with fruit, and mush with cheese, are in the list of recipes. Fish cakes with corn meal are good and corn meal and meat of different kinds may be cooked together, "scrapple" being a favorite in some parts of the country.

Corn bread and corn griddle cakes are made in many ways, all good. Bread may be made of wheat flour and corn meal, half-and-half. Puddings and even doughnuts and cakes are made with corn meal as the basis.

Recipes for using corn meal in all these ways, and others, may be had from Department of Agriculture, Washington, D. C., upon request.

Learn how to cook all kinds of staple foods and to serve them in a variety of ways. Simple dishes well prepared are better than expensive foods badly cooked.

USE MORE CORN

California should grow more corn and eat more corn. Through the courtesy of the Sperry Flour Company we are enabled to give these excellent recipes from the Sperry Cook Book. Try them.

Corn Bread (Thin)

One cup yellow corn meal, one cup flour, quarter cup sugar, half teaspoon salt, two teaspoons baking powder, one egg, one cup milk, one tablespoon melted butter.

Mix in the order given and bake in two Washington pie tins, spreading the mixture thick enough to half fill the pans.

Boston Brown Bread

One cup rye meal, one cup corn meal, one cup Graham flour, one cup flour, three-quarters cup molasses, 1¾ cups milk, one teaspoon salt, two teaspoons baking soda, one egg. Mix all the above to a smooth batter and steam three hours. Currants and raisins may be added.

Thirded Bread

One cup white flour, one cup rye flour, or sifted rye meal, one cup yellow corn meal, one teaspoon salt, three tablespoons sugar, one-half cup yeast. Mix with milk (scalded and cooled) till thick enough to be shaped. Let it rise until it cracks open. Put into a brick-loaf pan, and when well risen bake it one hour.

Brown Bread

One cup rye flour, one cup corn meal, one cup entire wheat flour, one cup sour milk, one-half cup molasses, one teaspoon soda. Steam three hours.

Tea Gems

One pint milk, four eggs, two cups corn meal, one teaspoon salt, two teaspoons baking powder, one cupful flour, one tablespoon butter. Separate the eggs; beat the yolks and add the milk, salt and butter (melted). Add the corn meal, baking powder and flour sifted together. Beat rapidly for about two minutes. Then fold in the well-beaten whites of the eggs and bake in greased gem pans in a quick oven for a half hour.

Virginia Waffles

Cook one-half cup white corn meal in 1½ cups boiling water 30 minutes, adding 1½ teaspoons salt. Add 1½ cups milk, two tablespoons sugar, two tablespoons melted butter, two cups flour mixed with two heaping teaspoons baking powder, and two eggs whites and yolks beaten separately Cook in hot, well-greased waffle-iron.

Jolly-Boys

Mix and sift together three cups rye meal, one cup flour, one-half cup corn meal, one-quarter teaspoon powdered cinnamon, one-half teaspoon salt, two teaspoons baking powder, and two tablespoons sugar. Add one beaten egg, two tablespoons molasses, and sufficient cold water to make a thick batter. Drop by small spoonfuls in a kettle of smoking-hot fat, and cook till brown.

Griddle Corn Cakes

Two cups yellow or white corn meal, boiling water, one egg, beaten, one teaspoon salt, one tablespoon sugar, cold milk. Add salt to corn meal, pour on boiling water to form a thick drop batter; add maple syrup and sufficient cold milk to make a thick pour batter. Drop by tablespoons on a well-greased hot griddle and cook as griddle cakes. Serve immediately.

Hominy Fritters

Two cups flaked hominy (boiled), two eggs well beaten, one-half level teaspoon salt, one-half cup milk, one-half cup flour, one teaspoon baking powder. Cook all the above in a double boiler; pour out in biscuit tin and allow to cool. Cut and fry in deep fat. Good with wild game.

Flaked Hominy, a la Sperry

Two cups flaked hominy, 1½ cups milk, one-half teaspoon salt, one-half pound American cheese, four tablespoons catsup, four ounces butter, sprinkle of paprika. Cream cheese with butter, add one egg, beat all to a cream, add catsup. Butter baking dish, put in layer of flaked hominy sprinkle with paprika; spread with cheese mixture; add another layer of hominy; have top layer of cheese;

pour on milk and bake 10 minutes. Take from the oven and make nests, putting in each one egg. Put back in oven for 15 minutes or until eggs are set. Serve from baking dish. Better if cooked in shirred egg pan.

Hominy—Italian

One cup hominy (cooked), one-half pound cheese (grated), one-half can tomatoes, one large onion chopped and partly cooked in butter, two tablespoons Worcestershire sauce, three drops Tabasco sauce, three tablespoons butter. Butter baking dish well. Put in layer of hominy alternating with cheese until dish is nearly full. Pour on onion and tomatoes mixed with the seasonings and bake one hour.

HOUSEHOLD QUERIES

Everlasting Yeast

Would like further information regarding "Everlasting Yeast," recipe for which you publish in the issue of February 10. How much of the yeast is required for four loaves of bread and should the sponge be set overnight?—Subscriber, Los Angeles.

Make the starter by boiling three large potatoes (or one large teacup when mashed). Mash well, add one tablespoon salt and two tablespoons sugar, then one pint of cold water. Now, while it is lukewarm add one cake of compressed yeast and in 24 hours it will be a liquid yeast which will not fail and will not need more yeast cake for an unlimited time if renewed once a week in winter and twice a week in summer, and kept in a cool place between times of baking. For each baking boil (the evening before) potatoes as for starter, add salt and sugar and two pints of cold water for four loaves. When lukewarm add the pint of liquid yeast and allow it to stand until morning, then take out one pint to save for next time. To the remainder add flour to make a thin batter, let stand one-half hour in a warm place and it will become very light. Add flour to work stiff and set to rise. Work down once and when again light work into loaves.

Grapefruit Marmalade

Answering request for receipe for grapefruit marmalade in a recent Cultivator Mrs. W. A. Smith of Orange sends the following:

Remove skin and white pith, cut former into shreds and boil until tender. Put into kettle sugar equal in quantity to weight of fruit, adding to it all juice that can be drained from fruit: let this come to boil and skim. Then simmer syrup 15 minutes; put in pulp and rind and boil again 15 minutes. Put in tumblers. This is most excellent.

DO YOU KNOW?

That every bit of uneaten cereal can be used to thicken soups, stews, or gravies?

That every spoonful of left-over gravy can be used in soups and sauces, or as flavoring for meat pies, croquettes, and vegetables?

That every bit of clean fat trimmed from meat and every spoonful of drippings and every bit of grease that rises when meat is boiled can be clarified, if need be, and is valuable in cookery? Don't fatten your garbage pail at the expense of your bank account.

EASTER MORN

A most inspiring scene in these times of universal war was that offered on Easter morning at many places in California. Especially was this true at Mt. Rubidoux, Riverside, which was the setting of the origin of these services. In 1907 these Easter services began on Mt. Rubidoux. This year proved the greatest gathering, and Riverside people have issued a most beautiful booklet containing order of services used on that morning.

Don't be finicky. Be willing to try new foods. Certain plentiful and nourishing foods widely used and enjoyed in one section are practically unknown in other sections of the country. Learn to know all the good things, not a few only.

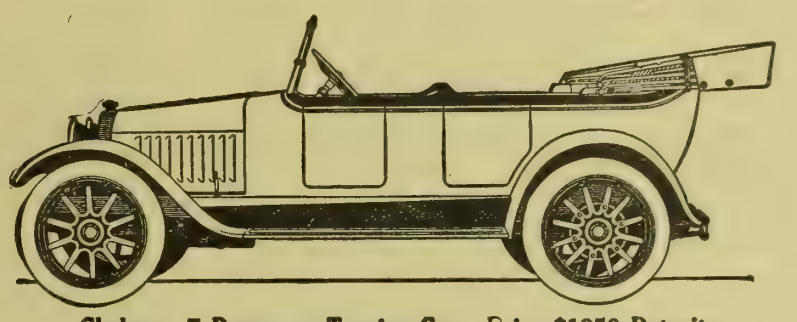
People too easily get into food ruts; insist on eating only the food they are used to, and refuse to give a fair trial to others. This causes undue demand for certain staples, with resulting scarcity or high prices when crops are short. At the same time other valuable foods may be relatively cheap and available.

Remove from your vocabulary "don't like" or "can't eat." Most individual prejudices against widely popular foods are either imaginary or baseless. Try to like every simple food; give it a fair trial for your own sake.

Make saving rather than spending your social standard.

WISTARIA

The Wistaria is now in its glory. All over California may be seen on houses, trees or pergolas this wonderful flower. There are several varieties. This shown in the engraving is Wistaria Sinensis. Another with large white flowers is Wistaria Japonica, which is becoming common. This plant demands rich soil, plenty of water and after blooming the weaker stalks should be removed and vigorous growth induced. Also, where branches are twisted about each other and liable to strangle or cause the death of either they should be disentangled or fastened on house or over pergola. — Engraving by Courtesy of Fresno Nurseries.



Chalmers 7-Passenger Touring Car—Price $1350 Detroit

Daily You Will Find

New Charms in This Chalmers

Some cars are noted for their comfort. Others are distinguished for their beauty. Others, for the strength of their chassis. But the Chalmers is an all around car. It has power, comfort, beauty, strength. All four.

Comfort

Picture a 122-inch wheelbase. With a front seat 41 inches wide, and a tonneau that extends from front to rear more than the reach of the average man.

Power

Imagine the engine that weighs 550 pounds. And turns up 45 horse-power. One horse-power for every 12 pounds of weight. Which with a total car weight of 3005 pounds means power ease on the hill. One horse-power for every 67 pounds of car weight.

Strength

Then turn over in your mind the extreme strength there must be in a car that is largely built of drop forgings, chrome nickel steel, Lynite aluminum, crucible nickel steel and carbon steel.

All expensive metals. But placed in the Chalmers chassis for a specific purpose—to make it rugged and strong, though light in weight.

Such quality makes for durability and economy. For a thing made of good materials, always is well made.

Beauty

And a car made of this kind of materials you find everywhere in the Chalmers would be indeed incomplete without beauty and distinctiveness of lines.

See the high narrow radiator, the double cowl, the sweeping body lines, the finish that denotes hours of patience and care. And provides beauty, not for a day, nor for a month, but for years.

All the above means quality. The kind of quality you need in the car you buy and the kind of quality you GET in the Chalmers.

From Shell to Griddle

A Study of the Methods of Successful Poultrymen in Hatching and Brooding

Written for California Cultivator By Jean A. Koethen

HATCHING chicks by electricity is a commonplace, but who ever heard, before this year of grace, 1917, of raising them by electricity? Yet this is just what W. G. Suits of the Bandini Poultry Ranch, Riverside, is doing. Every morning at five o'clock or thereabouts, the chicks from the first day they are in the brooder are awakened by the turning on of the electric light in their house. Out they come, pell mell, eager for the meal that is waiting for them. The house is perfectly warm, of course, and they begin to eat at once and keep it up without much intermission till half past seven or later in the evening. As soon as the evening shades begin to gather the lights are turned on again, and the chick, supposing it to still be day, keeps on eating till its supper at half past six leaves it without room for another bit of cracked grain. Then under the hovers every chick goes—if there happens to be a hover for it, and sleeps while its digestive organs work, till the light is turned on again. Mr. Suits believes that by this system of lengthening the day he pushes his Leghorns along considerably faster, for the more chicks eat, and digest, the more rapidly they grow.

Some of the chicks on the Bandini Ranch are brooded by hot water pipes under hovers. Others gather about an immense distillate stove. The morning I was there 1200 had just been placed in the brooder room about the stove, and the heat was at about 97 degrees, though it seemed much warmer. The chicks, newly hatched as they were, were running about with a cheerfulness that left no doubt of their comfort, and already beginning to look for the fine grain in the straw which covered the floor to a depth of several inches. Mr. Suits prefers the stove brooder to the water pipe brooder because the ventilation in this particular brooder is better. Ventilation, in raising chicks artificially, is always a problem, and there are as many methods of solving this problem as there are different makes of brooders. There are some good hot water systems and some good stove ventilating systems, and a great many poor systems of both kinds.

Another new "wrinkle" of Mr. Suits' is the cutting off of the first joint of every chick's wing as soon as it is out of the incubator. The operation, performed at this time, is practically painless and makes it impossible for the birds to fly over fences.

Mr. Suits' method of feeding is patterned to some extent after that followed at the university farm at Davis. The chicks are not fed till they are at least 48 hours old. Then for five days they are given only a mixture of steel-cut oats, cracked wheat and fine cracked corn. This is scattered in the straw so that they may learn to scratch and to eat at the same time. On the sixth day mash feeding begins, but Mr. Suits does not follow the common practice of setting the mash before the chicks and leaving it there. Instead, he begins with a feeding once a day, leaving the trough before the chicks till their hunger is satisfied, then removing it. The number of meals per day is gradually increased till after the tenth day the feeding schedule is as follows: 5 a. m. grain mixture in litter, 9 a. m. mash, 1 or 2 p. m. grain mixture, 4 p. m. mash, 6:30 p. m. grain.

The mash, which is fed from the tenth day till the chicks are about three months old, consists of the laying mash which is fed to the hens mixed with an equal quantity of bran. This is mixed while the chicks are small with cottage cheese so that it is slightly crumbled but never really wet. The number of meals is gradually reduced after the chicks are out on the ground, but never during this first three months is the mash left standing before them. This method of feeding forces them to dig and scratch constantly for the grain which is always in their litter and thus develops the muscle a laying hen needs.

As soon as the chicks are old enough to be out (and this depends largely on the weather) they are turned into pens which were planted to barley early in the season and now afford a delightful green run, and here they grow, running in the sunshine and nibbling the succulent grain, so rapidly that many of the cockerels are of broiler size in eight or nine weeks.

The chicks at Bandini Ranch were hatched earlier this year than ever before. "Last year they all molted in the fall, no matter when they were hatched," said Mrs. Suits, "so we thought we might as well get them out early." The 1200 chicks I saw in the brooder the first week in February were the last chicks of the season. Others of assorted sizes were running in the yards or occupying the cockerel houses, but the season's hatching for replenishing the flock was over. Hereafter the chicks that are hatched will be sold to people who have not, like the Bandini Ranch people, learned the importance of early hatching. "Our chicks never grew so fast", Mr. and Mrs. Suits declared, and they attribute this rapid growth partly to the early hatching, partly to the liberal use of electricity and in no small measure to careful and liberal feeding.

EGG LAYING CONTEST AT MOUNTAIN GROVE

By C. T. Patterson, Director of Missouri Poultry Experiment Station

The 290 hens in the contest laid 6040 eggs during March, which is an average of 20.8 eggs per hen.

Pen 53, S. C. White Leghorns, Missouri, won the cup for the month by laying 150 eggs.

Four Plymouth Rock pens are in the five highest places for March, the Barred, White and Buff Plymouth Rocks tying for third place. The pens occupying the five highest places for March are as follows: S. C. W. Leghorns, Missouri, 130 eggs; S. C. W. Leghorns, Pennslyvania, 128 eggs; Buff Rocks, Kansas, 121 eggs; White Rocks, Idaho, 121 eggs; Barred Rocks, Missouri, 121 eggs (tie); Missouri White Fluffs, Missouri, 120 eggs; Partridge Rocks, Ohio, 118 eggs.

The ten highest places to date are occupied by many breeds and varieties. They are as follows: White Wyandottes, Missouri, 509 eggs; R. C. R. I. Whites, New Jersey, 493 eggs; S. C. White Leghorns, Missouri, 442 eggs; White Wyandottes, New York, 440 eggs; Buff Orpingtons, Missouri, 433 eggs; White Wyandottes, Missouri, 432 eggs; White Orpingtons, Missouri, 427 eggs; R. C. Reds, Missouri, 423 eggs; S. C. Reds, Iowa, 419 eggs; R. C. Reds, Missouri, 413 eggs.

STORRS EGG LAYING CONTEST

Storrs, Connecticut.—Report for week ending April 3, 1917.

For the first time in many weeks the hens in the laying contest at Storrs have eased up a little. They laid a total of 4403 eggs in the twenty-second week, or virtually the same number as in the preceding week, but more than 200 eggs under the mark made in the corresponding week a year ago.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Fairfields Poultry Farms, 773; Jules F. Francais, 639; Merritt M. Clark, 617.

White Wyandottes

Merrythought Farm, 785; A. L. Mully, 706; Brayman Farm, 688.

Rhode Island Reds

Jacob E. Jensen, 777; Geo. W. Harris, 750; Allan's Hard to Beat Reds, 745.

White Leghorns

A. P. Robinson, 934; J. O. LeFevre, 774; Hilltop Poultry Yards, 762.

Miscellaneous

Obed G. Knight (White Orpingtons), 708; Cloyes & Sullivan (Buff Wyandottes), 693; Holliston Hill P. Farm (White Rocks), 665.

Barker Bros.' Great
"Confidence" Sale
of Home Furnishings
Is a Mobilization for "Home Defense"
(—A protection against the Assault of Rising Prices!)

This Great Confidence Sale is an assurance of Barker Bros.' ability to hold down prices—to maintain our low-priced leadership—in spite of the rising all along the line.

Our Confidence is based upon 37 years of business foresight and advantageous buying—and the certainty that our established policy will remain undisturbed in present-day affairs.

You may become the beneficiary of Barker Bros.' confidence by taking advantage of the marked reductions on a great variety of furnishings from practically every one of our many departments. You may make your home beautiful and comfortable at a lower cost than you may realize. You may make your home artistically and economically secure.

Remember, you can do your buying by MAIL through our Mail-Order Dept. as advantageously as though you visited our store yourself. Write us for what you need, if unable to call in person.

Barker Bros
ESTABLISHED 1880
Complete Home Furnishers

The WHY of
HARDMAN Sure Grip TIRES
Smooth Riding and Effective Non-Skid.
When You Buy Tires You Want to Know Three Things
How is the tire made
How far will it go
The Price ?
Well—
No tire is more scientifically nor more carefully constructed than the HARDMAN. Those peculiar looking rectangles cut out or molded out of the surface produce perfect vacuums under the weight of the car and at the same time the walls form complete bases of contact protecting the carcass and assuring long wear.

The application of an extra heavy PURE PARA CUSHION, together with the PLIABLE THREAD, STANDARD SEA ISLAND FABRIC and THICK GAUGE, ALL PARA FRICTION, render Hardman Tires much less liable to stone bruise.

Hardman tires are now sold under our regular warranty adjustment made on a basis of 5000 MILES. The price is equal to the lowest for the service rendered.—Two grades,
Hardman Sure Grip and
Hardman Junior.

Send for descriptive price list and state what car you have.

HAY

Under date of April 14 Scott, Magner & Miller say:

Receipts past week 1580 tons, the preceding week 1711 tons. Percentage of California hay in above receipts very small. Most of arrivals from Oregon and Washington. All grades firm and California production has advanced materially.

The showers of the past week of great benefit to crops in all localities that were reached. It is generally conceded that there will be practically no volunteer crop this season and as that is the first hay to arrival other than first cutting alfalfa, the latter will have to be used in place of the volunteer.

We quote the average wholesale price of hay in carload lots on today's market as follows, viz:

Wheat, Fy., lt. bales.....31.00@32.00

Citrus Fruit Market

LOS ANGELES, April 18, 1917.

During last week one day's shipments ran to 270 carloads. Other days' shipments have been close around 200. Fortunately marketing conditions are of the best and the immense quantity has been absorbed at fair prices for all good stock. There is a material easing of the market.

Shipments

Shipments of oranges from Southern California to date since November 1, 1917, 18,882 cars, lemons 3228, total 22,110; to same date last season, oranges 15,985, lemons 2606, total 19,591. From Central California to date this season, oranges 4060, lemons 164, total 4224; to same date last season, oranges 4343, lemons 146, total 4889. From Northern California to date this season, oranges 844 cars; last season, oranges 610, lemons 1.

The Farmer's Duty to the Nation!

IN the present situation, clearly the farmer's duty to Our Nation is that he produce food-stuff in the largest quantities possible—that he use every means available to conserve this food supply. Also, his duty to himself certainly demands that he produce his own needs as economically, and on as little ground, as possible, so he may have a maximum amount of farm products to sell at prevailing high prices, thereby securing greater profits from his labor.

Never was the need for a silo more apparent than under present conditions. Silage crops, on account of their greater tonnage, enable the farmer to produce his own feed on a comparatively small amount of ground, and very cheaply. Thus he has more ground to devote to crops for the market—crops that mutually benefit himself and his country. Silage, being a succulent feed, helps secure increased results from dairy herds and beef stock, adding more foodstuff of this kind to our national surplus.

Any GOOD silo will more than pay for itself every year in the hay and grain its use will save. The—

INDIANA SILO

—is a GOOD silo, as is shown by the splendid record it has made the past FOURTEEN YEARS on over 60,000 American farms, a record that has proven the methods and materials used in its construction to be right. Add to this the fact that it is fully covered by the Spaulding Guarantee—backed by our great resources—and you will realize your money invested in an Indiana Silo, known and used in every State in the Union, must be better invested than it could be in one of the unimproved types found everywhere.

The Indiana Silo is within YOUR reach, for our service covers the entire Pacific Coast. Our terms will permit you to pay for your silo out of the money it saves for you, and Indiana Silo Service will enable you to get results without experimenting. A postal sent us will bring our silo book—just off the press—and complete information in regard to prices and terms; it will also be your first step toward greater profits from your farm, and the production of greater food supplies for our country. Won't you take this step today? Thank you.

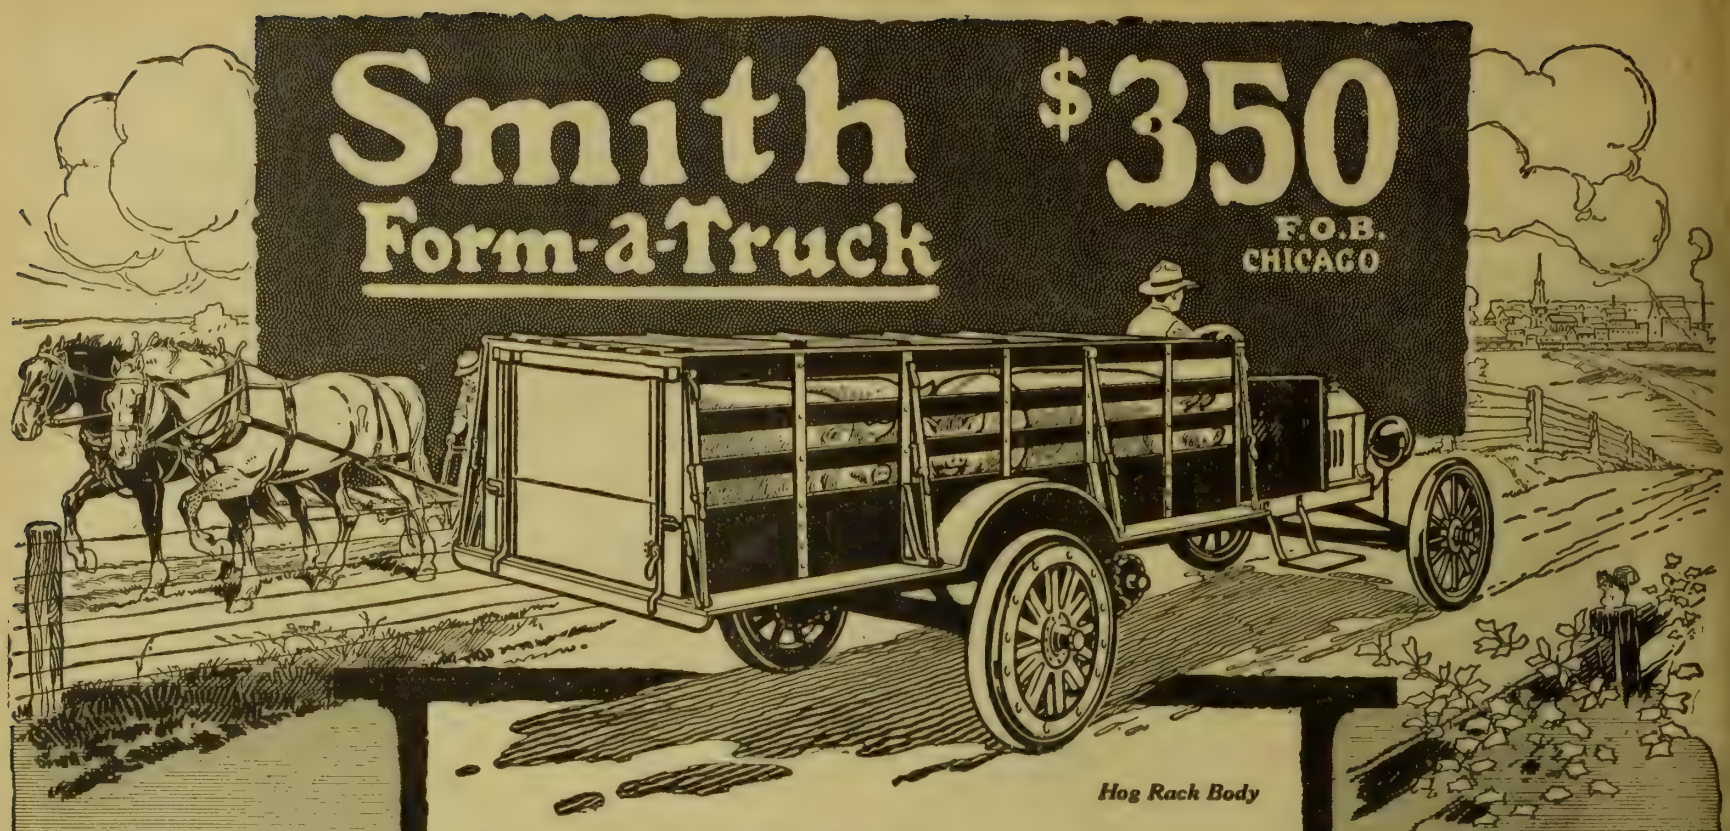
Smith Form-a-Truck

$350

F.O.B. CHICAGO



Hog Rack Body

You Need Your Horses for Plowing—

How Do You Do Your Hauling?

Smith Form-a-Truck is keeping every horse on the *farm* for live, money-making farmers. Plowing, seeding and harvesting are real work for horses. Get *early crops* and *fancy prices* by quick seeding and harvesting. Insure against crop losses due to delays in plowing. Do it by keeping your horses at real horse work and do your hauling with a Smith Form-a-Truck.

Stock Rack Body

Flat Rack Body

Flat Rack Body, Scoop Board Down

Rack Body for Hay, Straw, Loose Grain

These Big Savings

Use Smith Form-a-Truck for hauling hogs, sheep and cattle to market. One Smith Form-a-Truck will haul as much as 2 teams. *And in half the time*—10 to 12 miles per hour!

Save the pay of 3 drivers in hauling crops to town. *One* Smith Form-a-Truck and a *single* driver will do all the work of *4 teams* and *4 drivers*—a clear saving of $8 to $10 a day!

Smith Form-a-Truck will carry 2,000 pounds of milk 10 miles and return with the empty cans in less than 2 hours. And the total cost of the round trip is but $1.50—gasoline, oil, tires and everything. Think of it!

20 More Acres for Tractor Owners

Throughout the country tractor owners are now selling their horses and buying Smith Form-a-Trucks. They are saving veterinary bills, medicine, shoeing, bedding—scores of needless expenses.

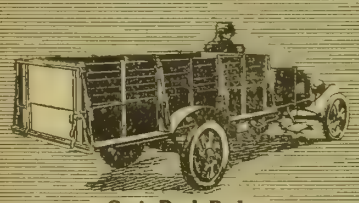
Government figures show that it requires all the feed grown on 20 acres of land to feed four horses.

A Smith Form-a-Truck *saves* this—giving you the use of this land for *other* crops.

20 acres of fine farm land for $350—think of it!

Now 8 Farm Bodies in 1

Change to any one of 8 types of farm bodies is now made instantly with the famous 8-in-1 convertible farm body. Not a single tool is required. Merely pull the lever and change from hog rack body to hay rack body for loose grain—high side flare board body—flat rack body—stock rack body—basket rack body—flat rack body, scoop board down—grain body. This is an exclusive Smith Form-a-Truck feature.



Grain Rack Body

Basket Rack Body

Double Strength

Smith Form-a-Truck combines with any Ford, Maxwell, Overland, Dodge Bros., Buick or Chevrolet—either new or used cars—to make a fully guaranteed, one-ton truck. When the chassis of these cars is telescoped on the Smith Form-a-Truck frame the remarkable strength of these cars is reinforced. You secure double construction—double strength—the strongest construction ever known to engineering.

And the rear axles of these cars become jackshafts for the powerful chain drive. The strong, sturdy Smith Form-a-Truck axle carries 90% of the load.

Amazing Economy

Never has any motor truck at any price surpassed the astonishing economy records of the Smith Form-a-Truck now being made in daily use on hundreds and hundreds of farms.

Note these wonderful economies: 12 to 15 miles per gallon of gasoline—6,000 to 8,000 miles on a set of tires—and practically no repair bills.

The first Smith Form-a-Truck ever built is still in daily service. It has traveled over 22,000 miles. And the total repair cost has been less than $8. Where else could you duplicate this economy?

High Side Flare Board Body

Send Coupon NOW

You need Smith Form-a-Truck on your farm NOW—AT ONCE. Keep your horses for farm work. Start saving money immediately by getting the full value of horses. Read the wonderful story of Smith Form-a-Truck in our big book—FREE to farmers. Yours for the coupon. Send it TODAY.

Vol. XLVIII No. 17 LOS ANGELES: April 28, 1917 One Dollar Yearly

Practical Irrigation of Lemons

Methods on the Limoneira Orchards in Ventura County as Described by Superintendent James D. Culbertson Before the Riverside Citrus Institute

THE holdings of Limoneira Company lie in Ventura County on a gently rolling south slope, about five miles west of Santa Paula and not more than 11 miles from the coast. The citrus acreage of the company consists exclusively of lemons, and the lemon orchards referred to in this paper are now 23 years old.

It has been the policy of the management always to provide these orchards with adequate moisture, irrespective of cost or other inconvenience, even to the extent of possibly using more water than necessary rather than risk a scarcity of moisture anywhere in the orchard at any season of the year. Our water supply has been so ample that there has always been a surplus, making it possible to irrigate any part of the orchard at almost any desired time. During the first six years so much stress was placed on abundant moisture supply that, in addition to over-generous summer irrigation, even during the rainy season the surplus water from the irrigation system was kept almost constantly in use with the idea of filling the soil with water against possible needs in the summer.

Like many other orchards the plantings had been blocked out in rectangles with straight rows, almost irrespective of grades. Fortunately, however, nearly every row on the ranch has a fairly uniform grade of its own, but the variation between grades in the different sections ranges from six per cent to no grade whatever. As every lemon grower would expect, the level areas were the first to suffer from gummosis, and likewise from them the first lemons infected with "brown rot" came into the packing house each year. Although during their early years the trees on these level portions were exceptionally large and productive, after about eight years this unusual vigor gave way here and there to a yellow mottling of the leaves which in some localities gradually developed into a chronic white chlorosis, in extreme cases not only robbing the trees of their power to produce fruit, but in many instances slowly killing them back to the ground. All of these troubles were attributed later to improper or excessive application of water. To remedy them the old woden flumes were replaced with cement pipe lines, and all furrows over 600 feet long on flat ground were reduced to half that length by additional pipe lines. In some blocks the direction of the irrigation was changed, and special provision made by grading and ditching to prevent flooding or accumulation of waste water or winter storm water at any point in the orchard.

These measures greatly relieved conditions, and local improvement was very evident in many parts of the orchard. In an effort to more intelligently regulate their frequency, both summer and winter irrigations were decided upon only after an examination of the soil with the aid of a shovel, usually to a depth of two feet. From the appearance of the soil to the eye, and the manner in which it held together or fell apart when compressed with the hand, the question of irrigation was determined. Depending on the amount of moisture, season of the year, condition of cover crop, or possibly immediate water supply, a 24, 36 or 48-hour run of water was advised, with practically no distinction between soils of different types, except that the heavier soils were not irrigated quite so often. In case any particular block did not appear sufficiently wet on the surface at the end of the alloted time, the water was allowed to remain an additional 12 or 24 hours.

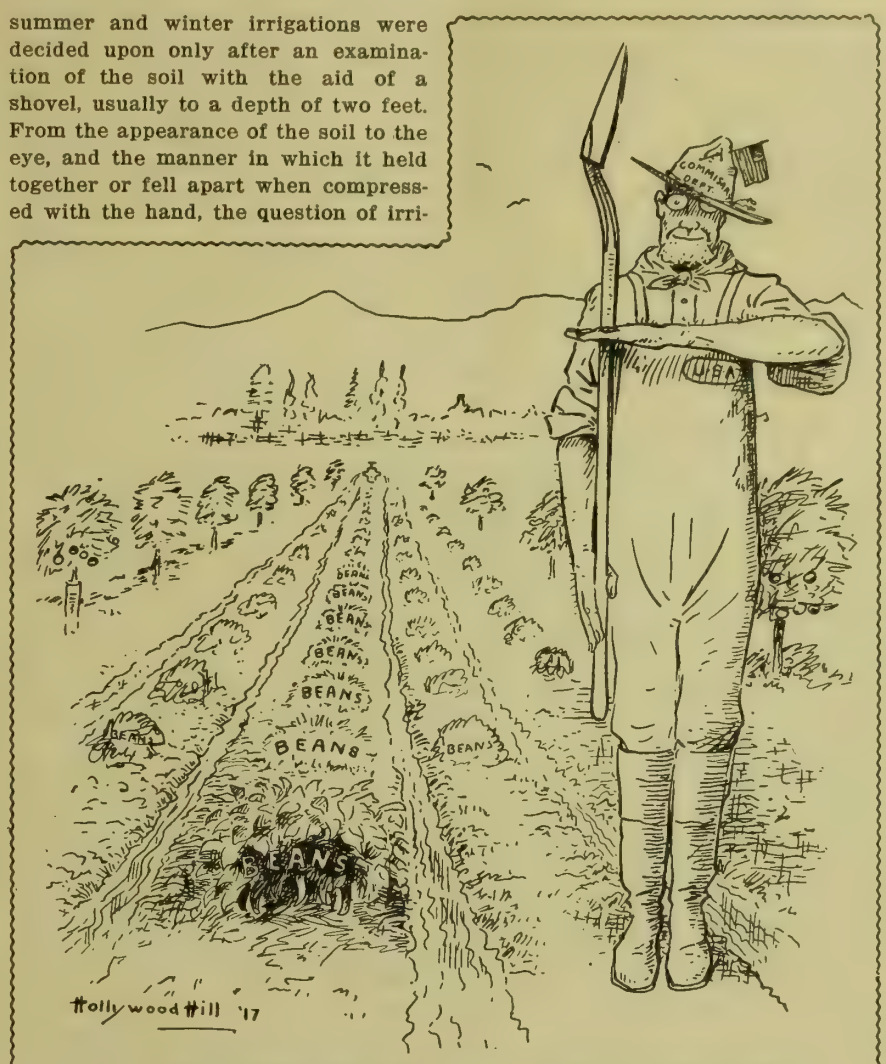
During a journey of investigation through the principal lemon growing sections of Southern California in the summer of 1911 we gathered from well known growers in several of the districts the following data as to their practices: Corona, 2½ acre inches about every 30 days; Whittier, 6 to 7 acre inches about every 42 days; Riverside 3 to 4½ acre inches about every 21 days; Azusa, 5 to 6 acre inches about every 30 to 45 days.

We returned to Santa Paula resolved to learn more definitely just what we ourselves were doing. The year previous we had begun to keep a calendar record for each section, but as our measurement of water consisted only of the total amount supplied to the entire property, the record was of value only in that it showed that our intervals between irrigations were decidedly irregular. Since the beginning of the year 1912 we have kept a complete record of the irrigation on each parcel of the orchard irrigated as a unit.

Our plan was to apply approximately five acre-inches at an irrigation as frequently as seemed necessary, still varying the interval between irrigations and making our decisions as before. Immediately we found that on the steeper land with grades running above three percent it required as much as 48 hours for the furows to absorb the specified five acre-inches, while on the flat areas often eight hours sufficed to accomplish the same result. To adjust the irrigators' and our own judgment to meet these differences was no easy task, and at the end of the year we found that we had averaged from six to 10 acre-inches at each irrigation instead of five as intended. An exceptionally deep plowing in the spring of 1913, and again a year later, so effectually destroyed the existing plow-sole and irrigation hardpan that during those years we used even more water than we did in 1912. We have prepared a brief record of the irrigation of several sections for reference, and a glance at the figures will show the amount of water used each year, the number of irrigations and the average interval between summer irrigations.

(See Table on Next Page)

Without exception the blocks that had received an average of above 45 acre-inches per year for the three-year period were in the poorest condition, while those that had received the least water were most vigorous. This record of three years was, in our judgment, fairly representative of the previous



IN THESE TRENCHES SHALL THE COUNTRY BE SAVED

The whole nation is preparing for a great war. A war we did not want for we are a peaceful people. Now that it is here we all say "Show me my part and I'll do it."

In the Southern Pacific Bulletin we note:

SONG OF THE AMERICAN RAILROAD MAN

We are the wings of the Eagle, spread to the scarlet sky.
Sturdy and Strong, we speed along heeding our Master's cry,
The Eagle's beak is the Army,—the Navy its curving claws
And both may fight through day and night, and the wings will never pause.

We are the wings of the Eagle and our steel-lined tips are spread
From shore to shore where the oceans roar,—from north to the Gulf stream's bed,
Let the soldier look to his rifle, and the sailor look to the sea
And what they need with an eagle's speed be sure they will get from me.

We are the wings of the Eagle, flecked with our labors' foam,
With freight and mail we blazed the trail for a mighty nation's home.
As in peace we have been your servant, so in war we will be your slave,
And our wings will hum, and our pulses drum till the flags of freedom wave.

We are the wings of the Eagle, eager to prove our worth,
Fitted by skill to do your will with the best trained men on earth.
Then load us up with the burdens and fire the opening gun,
And remember, Sam, the railroad man, is ever your loyal son.

To the above a member of the Cultivator staff adds:

SONG OF THE AMERICAN FARMER

We are the heart of the nation, throbbing with silent power,
Ready to answer the nation's call, ready to meet the hour
That asks the proof of our manhood, ready to pour red blood
Through every nerve and sinew, a life-bearing, crimson flood.

Ours to maintain that life-flow, to nerve to the bitter fight
The hand that strikes and the brain that plans to uphold our hard-won right.
The brain and the hand shall not falter, for, tireless, steady, true,
They know the heart is beating for the Old Red, White and Blue.

—R. D.

Samson Sieve-Grip Model S-25

READY?

Are you ready to get the best out of your farm this year?
Have you ample power for this season's work?
Do you want to get along with fewer horses and men?

SAMSON SIEVE-GRIP

Boost Your Citrus Trees Now

The grade of fertilizers determines the grade of Citrus Fruits. Chilean Nitrate has one hundred per cent of its Nitrogen Nitrated, and is ready to go into action the instant it is applied. It brings quicker, surer results than all others because they have to be Nitrated first. Why not buy your farm munitions ready for use, not subject to losses which the other Nitrogens always suffer? Common sense dictates that money is saved by its use. Its low price compared to others strongly commends it to the business grower.

DR. WM. S. MYERS, Chilean Nitrate Propaganda
25 Madison Avenue, New York

What are Pedigreed Trees? We want You to Reason Before You Buy Citrus Trees.

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries.—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertilizer, labor, investment tied up in land—these are the big factors that go to pot if, years after the trees are planted, the grove bears miscellaneous offspring.

history of the irrigation of the same areas, though doubtless the heavily irrigated portions had received relatively more water in years past.

In comparing the amount of water used on the Limoneira orchards with what seemed to suffice in other communities, we were forced to the conclusion that we were using not only more than the trees needed but so much that they were being injured as a result. Dr. C. B. Lipman had previously suggested that too much water might be responsible for some of our more general discouraging orchard conditions, and upon seeing these records was most emphatic in urging that barely more than half as much irrigation water ought to be an abundance.

The mean annual rainfall at Limoneira for the past 12 years has been 19.77 inches. Frequent fogs during the summer months, often prevailing for weeks at a time, tend to retard evaporation as well as to supply all vegetation with considerable moisture direct from the atmosphere. Derived largely from shales and calcareous sandstone the deep alluvial soils of Ventura County have exceptionally high capillary power. Such soils have the ability to absorb large quantities of moisture during rains and irrigation, and to an equal degree these same properties insure the gradual return of this moisture from great depths as evaporation and the demands of the trees and other vegetation deplete the near-surface supply. When these climatic and soil conditions were given due importance in their relation to local irrigation needs it was still more evident that our lavish use of water had little to commend or justify it if it was not necessary in the sections farther inland.

It seemed unwise longer to trust our judgment without a more reliable understanding of the moisture content as it actually varied in our orchards. This meant careful scientific work and required a man trained in a soil laboratory. Through the advice and assistance of Dr. Lipman we secured for this work L. W. Fowler, at that time just graduating from the University of California college of agriculture, and specially trained for such investigations. We were planning to reduce greatly the amount of water applied. This made frequent moisture determinations particularly desirable as a check lest we go to the extreme of using too little.

One of the most practical methods for reducing the amount of water applied at each irrigation has seemed to be to reduce the number of furrows per row, and so far as possible alternate the location of these furrows from one irrigation to another. For instance: one furrow close to the trees on each side of the row serves for the first irrigation; for the second two or three furrows made in the dry area not furrowed the first time. Only when preparing for the planting of the covercrop, usually in late August or September, have we resorted to the crowded furrows of the past. On flat land fewer furrows alone do not suffice, but they must be clean, well-made furrows, so that a fairly large head of water can be rushed through quickly, then reduced to a small stream and held long enough to penetrate to a depth of about two feet at the lower end of the row. For uniform distribution this method has proven very satisfactory where the land has but little grade, as stated above.

For nearly two years, once each week, moisture determinations have been taken at some 50 different locations in at least eight different types of soil. To a depth of six feet the moisture in each foot has been determined separately. Charles A. Jensen of the government laboratory in Riverside, kindly furnished us with determinations of the standard wilting coefficient and optimum moisture content of each of these soil types. By charting the orchard moisture as a curve and using straight lines for the wilting point and theoretical optimum moisture percentage, we have at a glance a graphic history of the moisture variations in any given field. On the basis of this data each irrigation can be timed and a close approximation made of the amount of water required.

The results of these efforts to understand better our actual need, and supply water accordingly, are shown by turning to the record of water used during the last two years and comparing it with the record of the three preceding years. The average irrigation has required from three to six acre-inches instead of from six to 10, and the average summer interval between irrigations has been reduced from 45 or 50 days to about 35. Perhaps we have used a bit too sparingly of water on two or three sections this year, but on the whole we feel that we are working toward a basis for much more intelligent irrigation than we have been practicing.

I would call your attention to the moisture condition in our Section Upper Six. This section has been consistently a normal, healthy orchard and is known to have had much less water than many of the other sections. Occasionally a tendency to wilt has been noticed near the lower end of the rows. This was undoubtedly injurious to both fruit and trees at the time and should not have happened, but it has had no permanent ill effects. It is an interesting coincidence that those blocks of orchard where trees have most often shown wilt have always received the least water, and one year with another have been our most

San Francisco California

atisfactory orchards. It is also sig-ificant that these blocks are located on land having one per cent grade or more. Just what relation the theo-retical optimum moisture content of his soil—or any other soil, for that matter—bears to the normal require-ments of lemon trees is still to be de-ermined. Only a few trees below the irrigation stand, the soil moisture re-mained above the optimum but a few days following each irrigation, and then in not to exceed one-half of the soil mass in which the trees feed. Neither fruit nor foliage of trees at this particular location, have at any time in the two years suggested lack of adequate moisture. On the other hand, near the lower end of the row, the moisture condition has permitted wilt of trees, premature coloring of fruit under size and even slight dropping of leaves. The difference between the moisture percentages does not seem very great, but evi-dently it is very significant. The standard wilting coefficient for this particulary soil appears to be about correct for lemons.

C. C. Teague, manager of Limoneira Company, has an excellent 40-acre lem-on orchard some two miles from the Limoneira. The soil is very deep and uniform, and the irrigation furrows have a grade of about one percent with almost no variation. The record of water used on this orchard for the past five years is as follows: 1912, 34.9 acre-inches; 1913, 31.8 acre-inches; 1914, 35.6 acre-inches; 1915, 33.7 acre-inches; 1916, 28 acre-inches. This is a remarkably consistent rec-ord, and it is well known to many of you who have visited this orchard that it is thrifty and uniform and reputed for its very heavy production of well-keeping fruit. From this orchard's appearance and its record 30 to 35 acre-inches of water applied annually, four to six inches at fairly regular in-tervals of about six weeks, might be regarded as a safe practice for the average lemon grove in the Santa Paula district. But there are so many variable factors; soil, grades, subsoil, amount of waste water, cultivation practices, etc., that generalization is hazardous. For the past two years some of the Limoneira orchards, with other factors quite comparable, have done so well with much less water that we feel the question of how much is still an open one.

CORN EAR WORM

THE pest of worms which has infested ears of corn has been most perplexing to the gardener and to the grower of sweet and field corn. This worm is hatched from eggs laid by an adult moth which is both a day and night flier. The moth is about an inch long and her eggs are a yellow-ish white. The larva is a most repul-sive worm which is sometimes two inches long, yellowish to brownish in color with longitudinal gray and white stripes. After the depositing of the eggs on the silk end of the ear of corn the "worm" hatches and eats its way into the tip of the ear. Sometimes these worms destroy almost the entire ear. The pest is not exclusively one of corn however, for it takes tomatoes, eating holes into the bottom or sides and causing decay. It also works in the South upon the cotton bolls and is there known as the boll worm. Other food plants of the worm are alfalfa, beans, cabbage, geraniums, gladiolus, grapes, malva, okra, many of the fruits, pumpkins, squash, etc. The usual remedy given for this pest is to plant a larger crop than it is desired to harvest in the hope that the excess rows of corn may save the remander of the crop from attack.

With arsenate of lead now put up in powder form, one of the best known being known as Corona Dry, satisfac-tory results are obtained. Treatment consists of placing dry arsenate of lead without any dilution in bellows and blowing the material over the ear of corn when the formation of silk is first discovered. This treatment to be repeated some three times at a total cost per acre of less than $5, prac-tically nothing compared to the bene-fits received. Other experiments which have been tried of placing the dry arsenate of lead in sacks made of light muslin or cheesecloth and shak-ing over the ears show results almost identical with those in which the arsenate was blown over the corn with a bellows.

Book Review

"HOME LABOR SAVING DEVICES"

"Home Labor Saving Devices," by Rhea C. Scott, district agent for home demonstration work in Virginia, pub-lished by J. B. Lippincott Company, Philadelphia, at $1.00.

This is a 120-page book illustrated with many half-tones and pen draw-ings of household conveniences and necessities, with specific instruction as to material required and how to make. There are six chapters and an appendix, chapter one touching upon kitchen conveniences, describing par-ing table, wall cabinet, jelly strainer, dish drainer, dish racks, coal and wood boxes, fireless cooker, etc. Other chapters touch upon dining room con-veniences, porch equipment and mis-cellaneous equipment. In the latter are discussed dustless mops, fly traps, garbage barrels, sewing screen, shower bath, waterworks systems, etc., poultry devices and dairy devices.

It is an attractive book, it is a help-ful book, and one which will help to add many conveniences to the home, especially where either the housewife or the man of the house is handy with tools.

The Pinedale Farm Improvement Association of Navajo County, Ari-zona, is arranging to mill its corn and wheat product and dispose of it in the form of cornmeal and Graham flour.

Even Fairbanks, Morse & Co. have to do it—!

The first "Z" engine announcement in the Fall of 1915 almost revolutionized the farm engine business. Certain it is—the "Z" *evolutionized* farm engine val-ues. Within the first twenty-seven days—over six-teen hundred new F. M. & Co. dealers saw the real service they would render their customers by selling "Z" engines. The close of the first year resulted in a distribution of over seventy thousand engines in 1-½—3—6 H. P. sizes to *satisfied* farmers who knew engine quality when they saw it on the dealers floor.

After perfecting the "Z"—thru modernizing our large engineering and quantity production facilities—we knew the demand would be big. So we bought ma-terials and accessories in almost unheard of quanti-ties. But enormous as were our purchases—they were depleted sooner than our biggest expectation.

Our financial resorces—and large consumption—make it possible for us to continue to enjoy except-ional advantages in getting trainload after trainload from primary sources of supply and the situation today with us is better than the average. The one or two price advances to date were small indeed com-pared with the increases we had to pay. But the lines are sharply tightening. Raw materials are getting scarcer and scarcer — prices we must pay are jumping by leaps and bounds. This means price advances to you from time to time, because "Z" engine quality will be maintained. At todays prices this engine marvel is — as it always has been — "a wonder at the price." So buy now. At least—this is our advice.

The Service You Get When You Buy From Your Local Dealer

Go To Your Dealer and See the "Z"

Inspect it. Compare it. Match it point by point. Have him show you the features that make it the great-est engine value offered. You'll *buy* it.

The 3 and 6 H. P. Size Successfully Operate On

KEROSENE "Z" THE Z ENGINE

"More Than Rated Power and A Wonder At The Price."

Simple—Light Weight—Substantial—Fool-proof Construction—Gun Barrel Cylinder Bore—Leak-proof Compression—Complete with Built-in Magneto. Quick starting even in cold weather. Low first cost—low fuel cost—low maintenance cost. Long, efficient, economical "power service."

Fairbanks, Morse & Co., Chicago

All Fairbanks-Morse dealers sell "Z" engines on a zone carload low freight basis. If you don't know the local dealer, write us.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

We have often referred to the need for greater efficiency, and this year demands more of the California producer than any other. Fortunately California producers appreciate the opportunity and are fitting their farms to produce to the limit. Scenes like the one shown by photograph on the cover may be found in every section of California. The team is not in sight, but without question it is on some other portion of the vineyard doing its share. This view is made possible by the courtesy of the Yuba Construction Company of Marysville.

PAY TAXES

Next Monday is delinquent day for second payment on all county taxes in California. Save the penalty.

GOING TO THE FAIR

Yes, we are aware that agricultural fairs are months away. September will be about the date for the first fairs, but to get the stock and other exhibits ready for an agricultural fair months are required. It will be good drill to spend the summer in fitting some of the thousands of farm products for next fall's expositions.

THIN THE FRUIT

With all of the urging to produce more there may be hesitation on the part of fruit producers to thin fruit, as short as some fruit crops will be in some sections. Yet there will be a setting of more fruit than the trees should carry. Reduce it; it costs money, but it makes money. Less draft is also made upon the tree to produce one large fruit with small pit than many small fruits with large pits.

CROP REPORT

The outlook for apricots is better than when the Cultivator's survey was made. Lester C. Reed of Ventura County writes:

"Since making my last report, conditions of the valley have changed. We have a 75 per cent crop now with the fruit well set, and from what I can hear, over the county it is very much the same way. The late bloom was never known to set so well.

"As for price we can certainly get it if the growers will stick together. With every other commodity almost double there is no reason why we should not get some of the advance for our 'cots."

Mr. Reed's former estimate was for a 60 per cent crop. From others we have similar reports.

We repeat: "Let every producer keep his head."

ONE CENT LOSS

When anything occurs which unduly depresses the market, for example on one of our farm products, that of eggs, the loss is vastly greater than is appreciated by most of our people. The statement is made that with the egg production of the United States as it is today one cent loss or increase means $18,000,000 cash loss or increase. Of course some of this falls on the cold storage man or the middle man, but the greater part of it on the producer. The value of the poultry products in the United States is nearly equal to the value of the wheat crop and is half that of King Cotton.

MORE ROADS

The forest service announces that it will soon issue a series of weekly reports on conditions of principal auto roads in the national forests. The national forests of California comprise about 19,000,000 acres, and have within their borders 8600 miles of roads. These roads are being constructed through the use of a fund voted by the last federal congress. Nearly a million dollars of this fund is available for the roads of the national forests of this country for this one year. We believe the weekly reports may be secured by writing to the San Francisco office of the United States forest service.

RAISIN DAY

Monday will be a day of festivity in every raisin section of California. It should also be a day of serious thought as to disposal of raisins for the next five years. The five years' contract made at the time of formation of the Associated Raisin Company has succeeded in making thousands of dollars for raisin producers. Will this contract or its like be signed to the same extent as formerly? Presumably it will, for raisin producers are wise enough to see the results of their cooperative effort. The new administration has entered upon its duties with the good will, not only of the producers but of the trade. Its dealings in the past have been eminently fair and have given stability which is as pleasing to dealers as to growers. Hence Raisin Day should be as much a day of rejoicing because of the accomplishment of this association as because of the fact that the last year has been one of exceptional returns to the grower. Those who are not producers of raisins should enter as heartily into the observation of this day and eat raisins for breakfast, raisins for luncheon and raisins for dinner and another small portion at bedtime.—This last partaking is not necessarily in the form of mince pie.

PROVIDE FOR THE STOCK

We have been talking for several weeks about the duty devolving upon every patriotic citizen of producing to the limit. This that the human race may be fed. Appreciation of this need has manifested itself largely in the planting of beans and potatoes.

Meantime the chickens and live stock generally are not being overfed. With wheat around five cents per pound and with hay—at least delivered to consumers in some sections—selling for two cents per pound, there must be economical feeding or these faithful farm helpers will soon eat their heads off. This is literal as to thousands of poultry. At present prices of grain and present prices of eggs the poultryman who has no grain stored from former purchases must give up or borrow money. Hence, with all the plantings now going on sorghums for fodder and for grain are essential if our meat and egg supply is to be preserved. Meantime let poultrymen not be too discouraged for the general disposal of poultry is bound to bring reaction. Meantime grow cheaper feed and be ready for the harvest.

FARMERS AND FARMERS

Speaking of producing more reminds us that there are farmers and farmers being developed by the present campaign. Some of the old-timers fear they may be driven from the producing field by the great influx of the back-to-the-landers. Especially in the cities thousands of these would-be farmers are learning some of the difficulties which confront food producers. In this respect this campaign will do a world of good to the farming industry; there will be a more sympathetic understanding on the part of thousands of city dwellers. Regarding some of these, here is a sample from the joke column of an exchange, which conveys a truth as to conditions this year:

"Going to plant some potatoes in your garden this year?"
"I thought I would, but when I looked up the way to do it I found that potatoes have to be planted in hills, and our garden is perfectly flat."
—Isle of Pines Appeal.

Again, some orchardist planting intercrops may overestimate his quantity of moisture, and when he finds his trees suffering may be compelled to sacrifice the annual crop. Every orchardist should investigate thoroughly as to amount of moisture now in the soil and as to the supply of irrigation water he may depend on.

We must produce more, but we must use judgment in starting crops which may possibly not be harvested.

It has been asserted that should peace be declared today the demand for food to be shipped to countries which we are not now supplying would be so great that our present available supply would be exhausted almost immediately. Reports from the International Institute of Agriculture at Rome show the southern hemisphere's grain crop now coming into the market is much smaller than for sometime. Europe is producing materially less. The American winter wheat crop is a partial failure, and while the spring crop is being planted more extensively there is no assurance of large harvests. There is hope, however, in the fact that most careful work is being done by farmers of all sections.

American Beauty Dust Sprayers

Agricultural News Notes of the Pacific Coast

Northern California

Asparagus canneries are now in full operation.

The college of agriculture, through farm advisers, is planning a silo campaign.

A Yolo County man reports a profit of $135 per acre with alfalfa and sheep.

Sharp advances in rice quotations are inducing planting of every available foot.

The poultry department of the Placer County farm bureau recently held a poultry-dressing demonstration.

The Mt. Pleasant farm bureau, Placer County, has determined on holding a farm bureau fair at Auburn.

The Valley Flower Creamery Company of Ferndale has contracted to pack 150,000 pounds of butter for the navy.

The California Ripe Olive Company at Oroville is increasing its productive capacity by enlarging its packing plant.

The Central Creamery at Ferndale is now putting up a government order for butter amounting to 780,000 pounds.

Sacramento is now canning spinach, one of the latest of canned products. There are two canneries working on this one crop.

The Anderson Water Company will furnish Shasta County growers free water under certain restrictions for the growing of food crops on waste land.

Agricultural experts from various portions of the state, at a meeting held in Berkeley, devised ways of encouraging more general planting and better care of all food crops.

The annual meeting of the California Fruit Distributors, held recently at Sacramento, organized for next year's work. The Distributors handled last year in excess of 10,000 cars. This organization is the largest handler of deciduous fruits.

Central California

Farmers near Porterville are reported to have planted 100 acres to jimson weed for sale to druggists.

Wylie M. Giffen, president of the Associated Raisin Company has been named manager with Fred A. Seymour as assistant.

It is announced that a farm adviser will soon be appointed for Merced County. Necessary funds will be available July 1.

Three hundred men are at work on the Lindsay-Strathmore irrigation system. The district owns 1172 acres of water bearing land.

The Porterville Alfalfa Company last week made a sale of $1000 head of beef cattle at an aggregate price of between $115,000 and $120,000.

At a recent meeting of the Tulare County Canning Peach Association the damage to peaches from the recent frosts was estimated at 50 per cent.

Horticultural Commissioner Roullard of Fresno County has stationed an inspector in the Kerman district to keep a sharp lookout for pear blight.

The Lindsay Citrograph is authority for the statement that during the week ending April 11, $13,377.69 worth of hogs were marketed from that district.

Director Robinson of the Associated Raisin Company states that practically no damage was done to grapes, except Seedless by the recent cold, and very little damage was suffered by Seedless.

The committee on Resource and Food Supply of the State Council for Defense is holding hearings in various sections to learn from farmers and business men as to the food resources of the state.

The California Railway Exposition, the three exhibit cars which the San Joaquin Valley Counties Association is to send East in a few weeks to advertise this section of California is now on preliminary tour through the valley.

Southern California

Many acres of beans will be planted near Hemet this year.

The Hemet News estimates a 50 per cent apricot crop for the valley.

The Hemet Farmers' Club has joined in the county farm adviser movement.

Last week's rain brought promise to many grain fields and special encouragement to vegetable gardens.

At the April 10 meeting of the Hemet Valley Farmers' Club Prof. F. T. Bioletti of the university discussed olive planting.

All Indian agencies and schools have received orders to put every acre possible into profitable crops. The Sherman school in Riverside County is farming 340 acres.

Several hundred high school boys are at work in the beet fields thinning in the places left vacant by Mexican laborers who have disappeared, apparently over the border.

Suggestion that 200,000 acres set to young citrus groves in this state be intercropped this year, to add to the state's food supply is made by Dr. H. J. Webber of the Riverside experiment station.

Manager Adamson of the Pomona Fruit Growers' Exchange expresses the opinion that Southern California's summer crop of lemons will be very short owing to cool weather holding back development of buds.

The San Pedro Growers' Vegetable Association, composed of 50 growers, has 3000 acres planted to early tomatoes, peas, beans, potatoes, squash and cucumbers. The association has a sales manager who markets direct to buyers.

It has been suggested that the pig club contests of the Imperial Valley include pigs intended for breeding purposes as well as for marketing. Auctioneer Zinn, who sold the hogs raised by the school children in the last contest, at Brawley, makes the suggestion.

The Coast

Polk County, Oregon, has 1600 acres in bearing prune orchard.

Sheep raisers in the section about Powell and Butte, Oregon, have formed an association.

A carload of flax fiber seed was sent out of Salem, Oregon, last week from the penitentiary flax plant.

The granges of Riddle and Canyonville, Oregon, have incorporated for $10,000 in order to build a processing plant for prunes.

The new cooperative creamery at Caldwell, Idaho, was dedicated March 29. The creamery has 200 regular patrons, most of whom are stockholders.

The Pomona Grange of Lane County, Oregon, has built a large warehouse to be used for storing produce of members and supplies purchased in quantity.

The Caldwell Cooperative Creamery Company of Idaho has just finished construction of a new creamery building. The new building is constructed entirely of cement.

As a result of a contest among boy cotton growers of the Salt River Valley last year Fred Medlock of Tempe won first prize, producing from one-half acre 310½ pounds of lint, valued at $165.40.

Stockmen of the Northwest are incorporating the Pacific National Dairy Show. The show is planned to be held in Portland this year, the following years at other centers in the Northwest.

The Yakima Valley estimates its fruit shipments for the coming year at 12,600 carloals. The greatest increase will be in apples, the estimate for 1917 being 1000 carloads ahead of last year's shipments.

President Hagenbarth of the National Wool Growers' Association prophesies a cut of 30 per cent in stocks of sheep, owing to the acting of the new live stock homestead law which will cut out range flocks in many states.

No elaborate equipment necessary — no messing about with a sloppy spray mixture. "Corona Dry" is applied in dust form and gets the bugs before they start to eat the growing things. Call or write for a free copy of 20-page instructive book "Garden Pests and Their Control"—it tells how to get rid of all bugs, worms and plant diseases.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Ditches from Reservoir

Please tell me what amount of gallons per minute will run through a circular opening 15 inches in diameter, placed at the bottom of one side of a reservoir, with a 2½ foot head of water and also with a five foot head of water. Also what is the cross section of ditches used in general practice with a 15-inch opening in a reservoir holding five feet of water? The soil is sandy and has a slope of 20 feet to the mile.—Subscriber, Pozo.

A smooth circular opening 15 inches in diameter in the side of reservoir with the water standing two feet six inches above the bottom of the opening will discharge 1200 gallons per minute, and if the water is standing at the depth of five feet above the bottom of the opening the discharge will be 2000 gallons per minute. It will not be practical to run 2000 gallons per minute through an open dirt ditch in sandy soil with a fall of 20 feet to the mile as the velocity of the water will be so great it will destroy the ditch by washing. If but 1200 gallons per minute is desired cement pipe 14 inches in diameter can be used as it will carry 1500 gallons per minute and cement pipe of 16 inches diameter will carry 2100 gallons per minute if the larger amount is desired. Cement pipe laid with so much fall must be well supplied with air vents to prevent bursting in case gates are suddenly closed.—J. B. N.

Ants in Fruit Trees

Answering inquiry in recent Cultivator as to method of controlling black ants that eat fruit tree buds, J. L. Stewart of Ballena writes:

"In former years was troubled i this way but now I practice frequen cultivation, especially close around th the trunk, pulverizing the ground s fine ants cannot dig their holes. Nov I have no ants in my orchard. If fo any reason this is not practicable tak a knife and very carefully remove th rough scurf bark clear around th trunk of tree one foot or so fron ground, making a smooth strip abou two inches wide. Then take axle o any semi hard grease that will stan heat of sun well, and grease tw inches wide around tree on smoothe surface. Renew this once a week. N ant of any breed will cross the grease strip. Pay no attention to those o the tree for as soon as they find the are trapped they will drop off."

Green Manure in Walnut Orchard

Please advise best time to plo under melilotus in walnut orchard Think it would be ready to plow unde about the middle of May but fear plow ing at that time would injure the wal nuts by cutting off too many roots Would it be advisable to leave th plowing until the middle of August?— Subscriber, Anaheim.

Unless one has plenty of water th cover crop from now until Augus would make a heavy draft upon th moisture in the ground. Besides, dee plowing in midsummer is generall considerd objectionable because o turning up moist soil to the sun. Un less one plows unduly deep we do no think injury would be serious if th cover crop were turned under at thi time of the year.

University—Experiment Station

Please advise if the California ex periment station and the University o California are the same or, if not what is the correct address of each —Subscriber, Hemet.

The University of California is state institution and is made up o many colleges. One of these college is the college of agriculture, also a Berkeley. The experiment station i in one sense a state institution unde direction of the college of agricultur but supported in a measure at least b funds from the federal treasury. Th first experiment station in this coun try was that provided for by the New York legislature in 1849. In 1862 the congress of the United States passed a law, which was approved by Presi dent Lincoln July 2nd, donating lands to several states and territories and providing for the establishment of col leges for the benefit of agriculture and the mechanic arts. This was known as the Morrill act. Delegates from colleges established under this act met and began the agitation for funds for stations for experimental purposes. In the early 70's this movement gained headway, and one of the first to be established was that by the regents of the University of California in 1873, with E. W. Hilgard as director. The service of the station was greatly improved after the passage of the experiment station, or Hatch act "to establish agricultural experiment stations in conection with agricultural colleges" approved by President Cleveland March 2, 1886. The state legislature has aided generously in the work of this institution. The station is located at Berkeley but has several branches, such as the citrus experiment station at Riverside and the pathological laboratory at Whittier, the university farm at Davis, and experimental plots in various other portions of the state. The dean of the college of agriculture is Thomas Forsyth Hunt, and he is also director of the experiment station. Any mail addressed to Director Hunt at Berkeley

$1150 F. o. b. Racine
Mitchell Junior—a 40-h. p. Six
120-inch Wheelbase

Mitchell SIXES

$1460 F. o. b. Racine
7-Passenger—48 Horsepower
127-inch Wheelbase

Twice as Strong
To Give You a Lifetime Car

Here is a new reason for getting a Mitchell to drive on country roads.

In the past three years, John W. Bate has doubled our margins of safety. Now every important part—by test—has 100 per cent over-strength.

Over 440 parts are built of toughened steel. All safety parts are oversize. Parts which get a major strain are built of Chrome-Vanadium.

Gears are tested for 50,000 pounds per tooth. The springs we use—Bate cantilevers—have never yet been broken.

Several Bate-built Mitchells have already run over 200,000 miles. So it is quite unlikely that a man will live to wear a Mitchell out.

Extra Features

That over-strength, in our opinion, is the chief Mitchell extra. But there are many others.

There are 31 features in the Mitchell which nearly all cars omit. Things like a power tire pump, a dashboard engine primer, ball-bearing steering gear, etc.

And this year's cars have 24 per cent added luxury—all paid for by savings in our new body plant. The Mitchell is now the luxury car of its class.

All Extras Free

All these extras come free in Mitchell cars. They are paid for by factory savings.

John W. Bate has spent millions of dollars in building and equipping this model plant. It covers 45 acres. The one aim has been to build this one type of car economically.

His methods save us on this year's output at least $4,000,000. And all that saving goes into extra values.

The result is extra features, extra beauty, extra strength. Cars built in other ways can't give them.

One Size—$1150

Note that Mitchell Junior, with 120-inch wheelbase, sells for $1150, f. o. b. Racine. You never saw such value in a fine car. Even this smaller car has nearly all our extras.

Go see these new models. See what these extras mean. You will not then want a car without them. If you don't know the nearest Mitchell dealer, ask us for his name.

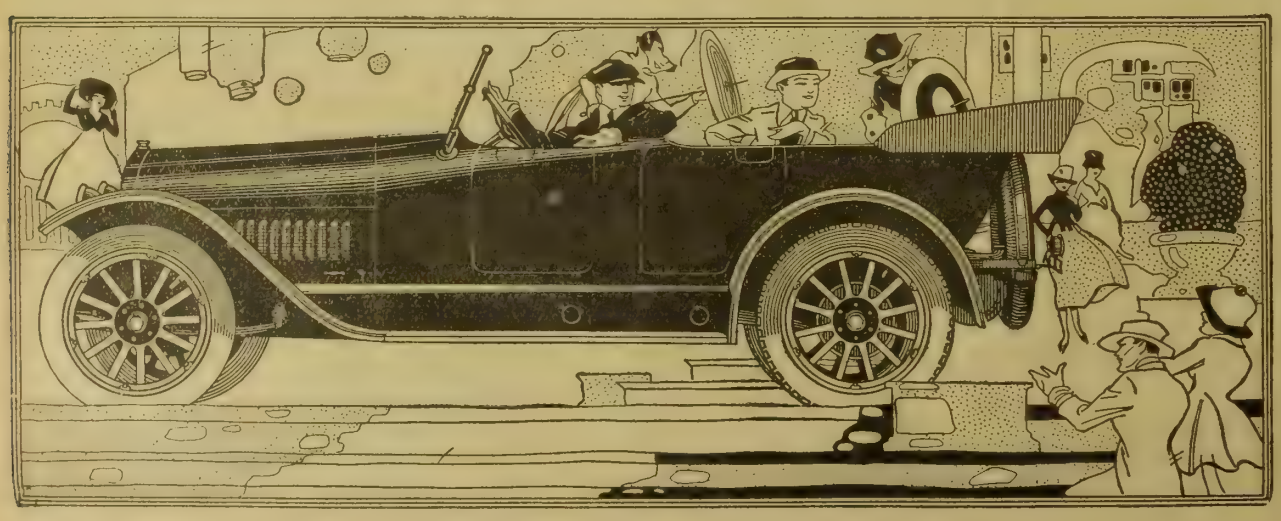
MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase and a highly developed 48-horsepower motor.
Price $1460, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines with 120-inch wheelbase and a 40-horsepower motor—¼-inch smaller bore.
Price $1150, f. o. b. Racine

Also six styles of enclosed and convertible bodies. Also new Club Roadster.



will reach any one of the various phases of the station work, or the agricultural college or the university.

Corn Ear Worm

In a recent issue, answering an inquiry as to corn ear worm, we referred to fuller treatment having been given in the issue of October 7, 1915. This has resulted in so many requests for that number that the edition is exhausted. For the benefit of these we are repeating on Page 485 the principal points given in that article. This treatment has proved exceptionally successful.

Using Nitrate of Soda

Inquiry having come as to the quantity of nitrate of soda to use with different crops, especially with beans, the matter was referred to Mr. W. F. Sparr of the Nitrate Agencies. Mr. Sparr writes: "For pumpkins use about 230 pounds of nitrate per acre in divided applications, beginning with one-third of the quantity as soon as the plants are up and repeat at intervals of three weeks. For Egyptian corn use 100 pounds per acre divided into thirds, applying the first as soon as up but with intervals of a month between the applications. For beans and peas apply 50 pounds per acre as soon as up. This will be enough to give the plants a vigorous start and they will then get from the air all the nitrogen they further need provided the soil is supplied with lime and the other plant nutrients."

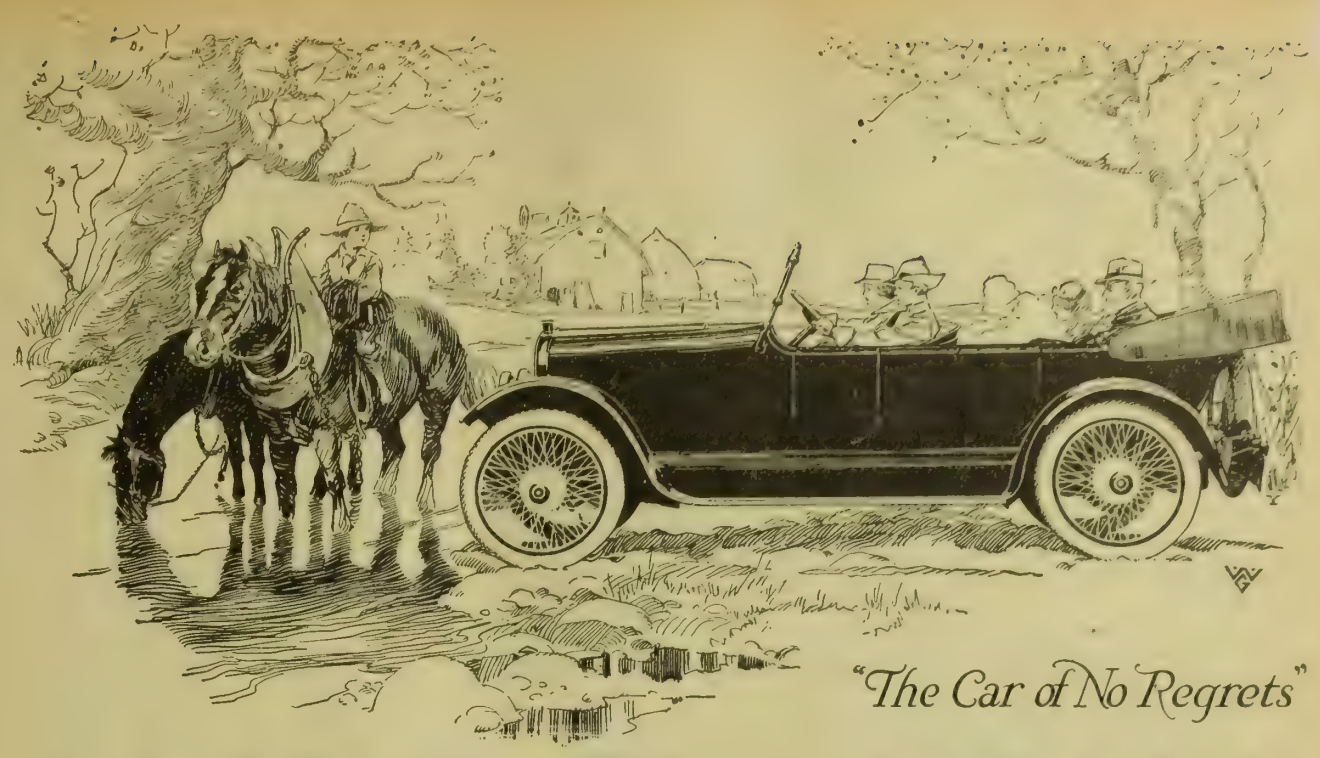
Mating of Pheasants

Have two pair of pheasants, but as the roosters fought was obliged to separate them and would like to know if one rooster will mate with the two hens?—Subscriber, Pozo.

"Pheasant Raising in the United States," Farmers' Bulletin No. 390, issued in 1910, under the subject of "Mating" says: "Most pheasants are polygamous, and each pen should usually contain one cock to from three to five hens, though the number of hens with one versicolor cock may range up to 30, while silver, Swinhoe, and Soemmerring pheasants breed in pairs. An extra number of cocks should be kept to replace any that die or are killed. In some pheasantries all the pheasants of one species are placed in one large pen, the proper proportion of cocks and hens being maintained, on the theory that while a smaller number of eggs results from this method, the chicks are stronger. But during the breeding season pheasant cocks are very pugnacious, and if not kept separate are apt to injure one another. Hence it is customary to have a small pen, not less than 9 x 18 feet or more than 30 by 30 feet, for each cock and his hens." Pheasant breeders will find much valuable information in the bulletin mentioned, which is written by Henry Oldys, also in "Pheasant Raising", Bulletin No. 1 of the California State Fish and Game Commission, written by Chas. A. Vogelsang. We presume this is still in print and may be had by writing State Fish and Game Commission, New Call Bldg., San Francisco.

THE POMEGRANATE

The agricultural experiment station of the college of agriculture, Berkeley, is issuing Bulletin 276, "The Pomegranate," by Robert W. Hodgson. The bulletin, which contains 30 pages, was prepared under the direction of Prof. Coit. It touches upon history, botany, different varieties, climate and soil requirements, method of propagation and general cultural directions.



"The Car of No Regrets"

KING EIGHT
60 HORSE POWER

UNFAILING SERVICE *on* FARM *or* BATTLEFIELD

Four luxurious body models mounted on the famous King chassis adopted for light armored cars by the U. S. Army and U. S. Marine Corps

FOURSOME—$1585—(*Shown above*)—Designed for those who desire the sport type of car, with long, low, rakish lines yet in perfect taste. Narrow and "racy," this car seats four in comfort, has lengthy leg-room and is provided with four doors. A locked compartment just behind the rear seat gives generous and convenient storage space. The two front seats are of the "bucket" type. At their back is a combination tonneau and handy lamp which may be removed from its socket and carried about the car. Color: deep maroon.

TOURING—$1585—With all the advantages of a 120-inch wheel-base, this car has the roominess of a Six of 126 to 128 inches due to compactness of King V-type motor. Has many novel conveniences, and upholstery and finish are of the highest grade. The ideal large-family car. Seats seven. Color: dark green.

SEDAN—$2150—A year 'round car of the most luxurious type, upholstered in highest grade cloth and equipped with divided front seats. Sides completely removable in a few minutes without leaving car, and as easily replaced. A special compartment behind rear seat is provided for storage of side sections. With sides in place this seven-passenger model becomes a perfect closed car, all sections fitting without possibility of rattle and with no appearance of being improvised. Three colors: beaver brown, deep maroon or suburban blue.

ROADSTER—$1585—A very popular model with farmers, physicians and salesmen, because of large storage space. Has two roomy compartments; one behind front seat and the other under rear deck. Comfortable for three. Color: French gray.

ALL PRICES QUOTED MAY BE ADVANCED AT ANY TIME

STUMPING — AGRICULTURAL

Here are the subjects of the books that are sent FREE:

Stumps 24 pages, 23 illustrations. Explains and shows the most effective methods of blasting. Tells you how to get out stumps of any size cleaner, easier and cheaper by using either of the Giant Farm Powders—Eureka Stumping Powder for dry work and Giant Stumping Powder for wet work.

Boulders Shows how to place charges for stone blasting. Gives amount of Giant Powder required to break up stones of various sizes.

Crops No deep plowing or cultivation is half so effective as subsoiling with the Giant Farm Powders. If you believe in tillage you believe in subsoil blasting. Ask for the Giant Subsoiling book, "Better Farm Tillage."

Trees Trees in blasted beds develop twice the root systems of trees in unblasted soil. They have the loosened earth and the food needed to do it. In blasted soil, rains and irrigation water sink down many feet and there is no surface run-off. The Giant Tree book, "Better Orchard Tillage," gives complete directions for orchard soil improvement.

Ditches You can blast out clean, deep ditches with Giant Powders. The sides will be sharp and even. The Giant Book, "Better Ditching," tells how to do it.

A Perfect Rice Binder Engine

Guaranteed For Life

MADE FOR YOUR RICE BINDER, as well as for general, all-around power purposes. The "NEW-WAY" has met with unqualified success in the rice and grain fields of the South.

Light and compact—no bulky, heavy water cooling system. Easily attached by patented bracket. Mounted on sub-base, this new model is especially suited for all-around work. Readily moved from one job to another on hand truck or skids.

THE "New-Way" ENGINE
GOES AND GOES RIGHT

Has lightest operating weight of any engine built for RICE, grain or corn binder; faultless jump-spark-ignition—high grade automobile carburetor; multiple disc clutch pulley; enclosed, oil tight, dust-proof, hinged crank case; direct cooling accomplished without any moving parts except fly wheel of engine.

Investigate the "NEW-WAY" now. Full information on request.

Built in 1 to 12 H. P., both vertical and horizontal. Prices according to size and equipment. Send for catalogue No. 43

Ask your dealer about this engine. mf23

Thinning Sugar Beets

A CALIFORNIA writer in "Sugar" gives the following excellent article on the vital importance of proper thinning of sugar beets:

The cultivation of the sugar beet in Europe has been developed into one of the most important of all agricultural industries. In America the industry is in its infancy. If we compare the average yield with those obtained in this country we notice the undesirable fact that our yield is far below the European. The average yield of 1914 in the United States (according to Truman G. Palmer) was 10.6 tons per acre as compared with 14.17 tons per acre in Germany; 12.52 tons per acre in France.

These discrepancies cannot be entirely caused by the difference in soil and climate, but are caused by appreciable differences in the stand. If we closely examine many of the poor stands we notice the small number of beets left to the acre and the large gaps between beets in the row.

"Thinning" is one of the most important operations of sugar beet culture. When a beet crop is planted in 18-inch rows, which is the most common planting distance, and if 15 pounds of an 80 per cent germinating power seed is used, under favorable conditions the total good stand will be 500,000 to 600,000. In most cases from this entire amount only 40,000 to 60,000 are desired; the remainder must be destroyed, as they will interfere with the normal growth of the selected ones. Thinning is done in two different ways: Bunching and thinning in two operations; thinning and spacing in one.

Methods in Europe

The blocking and thinning are done simultaneously in California; in Europe all the beets are bunched first and thinned afterwards, generally by a different crew. The bunching is mostly done by men, who with a long-handled hoe destroy all the beets and weeds for a distance of five inches, e. g., they leave a bunch of beets of approximately one and a half to three inches; these bunches are generally left four to five days before they are thinned out; this work (which is more delicate) is mostly performed by women and children.

The advantages of the bunching and thinning separately are: It is easier to select the strongest beets in a limited area; the average distance between the beets in the row is generally more even.

These laborers are paid by the day, working from sunrise to sunset, under the close supervision of a foreman who walks backward in front of at least 24 of these thinners. These thinners select the healthiest beets of the bunches, and, while holding with the left hand, pull up with the right the remaining beets which are placed in windrows, gathered by children and used as fodder. These thinners also destroy all the weeds not killed by the horse cultivators or hand hoes. They must perform all this work with their hands; no tools of any kind are permitted.

Thinning Contract Here

In this country this delicate work is not performed in the same careful manner, but in most cases this important work (in fact the one upon which the results of the entire crop largely depends) is left in the hands of disinterested laborers. The thinning contractor is paid by the acre, and in most cases pays his men also by the acre and deducts ten per cent for commission. These men are not interested in good work and, not being watched by the farmers, they try to go over as much ground as possible, to the detriment of the crop. There is no selection of the healthiest beets by the thinners, and if the strongest beets are left, it is merely by accident.

Purpose of Thinning

We must keep in mind that there is a triple object in view in thinning: Selection of the strongest beets; even distribution of a certain number of beets per acre; destruction of all weeds between the beets in the rows, and two inches on each side of the beets.

As a rule, under average conditions, the earlier the beets are thinned the better for the growth and yield of the crop, but not before all the sprouting seed in the ground is up, nor all the weeds have a reasonable start.

All beet fields should be rolled with a wooden roller, disk roller, or Cross kill, according to the mechanical conditions of the soil, and also cultivated before the thinning starts. Of course under exceptionally wet conditions when the ground is still too miry to hold a team, thinning should not be delayed too long and, if necessary, performed without the field being either rolled or cultivated, but under these circumstances special allowance should be made to the contractor.

The Proper Time

The larger the beets when thinned the more the roots of those to be left will be disturbed and the harder the condemned ones will come out, and sometimes if not cut off low enough the roots will add new foliage and double beets are the result.

Beets should be thinned when their four leaves are fully grown (not counting the two cotyledons or seed leaves) and sufficient thinners should be in the field to complete the thinning before the third pair of leaves are fully grown. If the undertaking is large and there is a shortage of thinners, it is advisable to start the thinning when most of the beets have four leaves.

Under normal conditions—when the weather is warm and there is sufficient moisture on hand — thinning should start about the fortieth day after planting when the largest diameter of the root is three mm. (about one-ninth of an inch) and weight, root and leaves, about four grams (or one fifth to one-fourth oz), the total length of the plantlet will be about four inches.

Beets should not be thinned when they have only two true leaves, because for practical reasons, at this stage of growth, the strongest developed could not be distinguished.

Thinning should also be delayed if the young beets are exposed to insect pests; if the soil is infested with wire worms, or cutworms, multipedes, flea beetles, or cucumber beetles. And under unfavorable conditions very small beets are more susceptible to the black root damping off (Phoma betae) and to the beet and garden nematode.

The most favorable weather is the cloudy, foggy days when the atmosphere is moist; discontinue during hot days.

ning is how many beets should we leave to the acre?

The following fundamental rules must be observed in deciding: The number of beets per acre should increase with the fertility of soil; with the quantity of moisture; the sugar content, coefficient of purity, saline coefficient, also will increase with the number of beets per acre.

The proper distance for a given field must be decided from the knowledge of the history of the field. If the size and weight of beets have been (for several years) exceptionally large with a relatively low sugar, low purity, etc., it is advisable not only to reduce the distance between the rows, but also the distance of beets in the row; in other words, increase the number of beets and reduce the average weight of beets.

What actually should be taken into consideration is the volume of pulverized soil at the disposal of each plant. Assuming that all beet land is plowed at least 12 inches deep, a very favorable distribution which has given, in good fertile soil with good drainage and sufficient available moisure, very good results, is one beet per cubic foot, or one beet per square foot. A perfect stand in this case would be represented by 43,560 beets to the acre. This very favorable distribution of the beets in the field is obtained when beets are planted in 18-inch rows by having the beets thinned eight inches apart, or, if planted in 16-inch rows by leaving them nine inches apart; in either case making a stand of 43,560 beets to the acre. The experienced beet raisers in Europe endeavor to raise 100,000 beets per hectare (2.45 acres), one beet per square foot.

TEST YOUR SEED CORN

GERMINATION test of seed corn is a form of insurance which it is mere recklessness to neglect, say specialists in the United States department of agriculture. Weak seed make weak stalks and poor corn crops, and to plant it is to throw away labor and land. It is the weak seed rather than the dead seed that causes loss. Most farmers plant a superabundance of seed and consequently their corn fields contain a superabundance of plants which are unproductive because seed was weak.

The process of obtaining good seed corn really should begin in the fall with the selection of the best ears from the field. If these are properly cared for through the winter the farmer should have a satisfactory supply for planting in the spring. Whether or not this has been done, however, it will pay him to test his seed corn ear by ear.

A simple method of testing single ears is to select two kernels from the opposite sides of the ear on the top, two from the middle, and two from the butt. These are put in numbered squares or portions of germinating boxes, or other testers. If the kernels are kept moist in a room where the temperature is not above 90 degrees Fahrenheit nor below 50 degrees Fahrenheit, the seeds should begin to sprout after a lapse of from six to seven days. If any of the kernels fail to give strong sprouts, the ear from which they are taken should be rejected for planting. If after testing a large number of typical ears the farmer finds that the results of the tests show a germination as high as 97 per cent of complete, he may be justified in considering that his seed supply is satisfactory and in omitting any further tests. Where there is any doubt, however, about the matter, it is much safer to test each ear the kernels of which it is proposed to plant.

If, as a result of these tests, the farmer finds that the corn he has intended to plant is unsatisfactory, he should take steps immediately to provide himself with a supply of good seed. This can best be obtained in the majority of cases from the immediate neighborhood. It is a great mistake for a farmer to obtain his seed from some section where conditions may be quite different from those under which he must grow his crop. Varieties which do well in a section where the growing season is long may not necessarily be at all suited to regions where the season is short. In buying seed corn, therefore, it is of the utmost importance to ascertain where the corn was grown.

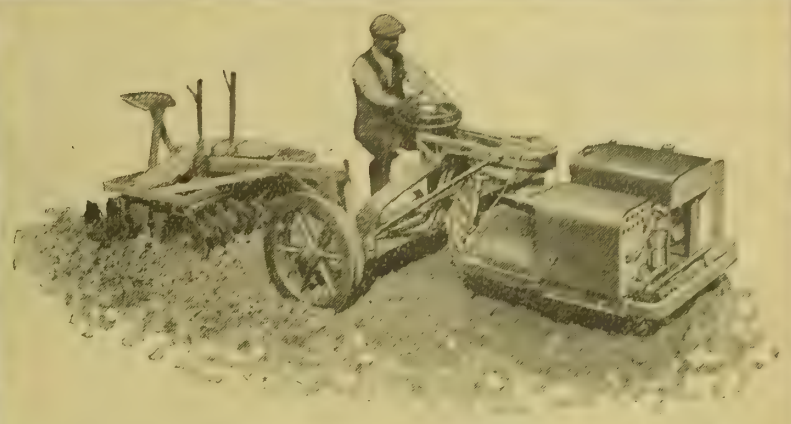
Save Money Cultivating with a Bean TrackPULL SIX HORSE Tractor



For pulling a cultivating tool, the Bean TrackPULL SIX HORSE Tractor hasn't an equal. This little machine also excels at plowing, discing, harrowing, spreading and other farm, orchard or vineyard work.

THIS IS WHY

The Bean TrackPULL Six-Horse Tractor is superior because its weight is only 2875 lbs.; does not sink in or pack the softest soil. Efficiency: It is the Tracklaying type, traveling on its own track, giving long traction, and responds quickly when a turn is to be made. Power: It does the work all day long that six hard working horses can do working continually, and it never wants to loaf when the hot days come. Superior Construction: It is equipped with Le Roi 4-cylinder vertical type—4-cycle motor, Donaldson air clarifier, Bosch ignition, Famous Hyatt Roller Bearings and New Departure ball bearings throughout, Perfex radiator, water cooled with centrifugal pump and fan, combination splash and pump lubrication, and is so simple a boy can operate it.

Completely circling a lemon tree with a 6-ft. Double Disc.

Pulling 12-ft. Forkner Cultivator making difficult turn. Distance between tree and fence 12½ ft.

Write us for the name of nearest TrackPULL agent and other information.

Prompt Deliveries in April

Although we have just finished a big addition to our plant to supply the ever increasing demand for Bean Tractors, every indication points to a demand very much in excess of the possible production, and we urge you to get in your order early.

Use Dynamite On Your Farm

If you have never used Hercules Dynamite on your farm you have no idea of the many tasks it may be made to perform—and perform more quickly, more thoroughly, and much more cheaply than can the methods usually employed.

In irrigation and drainage work especially does Hercules Dynamite prove its superiority. To run an irrigation ditch or a drain by its use is child's play when you consider the effort and time necessary to accomplish the same work with pick and shovel.

You simply plant the charges along the prescribed course. Connect with the blasting machine. Fire. There is the ditch. If you want to dress it up a bit, well and good. But usually it's ready for use just as the dynamite leaves it.

HERCULES DYNAMITE

is also most valuable for the work it does in tree planting—an operation which, by the way, can be performed as well by no other means.

Every progressive farmer is familiar with the almost phenomenal crop results that have been obtained in this way. Many, however, have not tried it on their own land. How about you?

In your own interest, in the interest of your farm, you should write us for a book which we have prepared on the subject of the use of dynamite on the farm. It is called, "Progressive Cultivation", and is sent free on request.

In it the subjects already mentioned, also many others, such as tree planting, road building, land clearing, etc., are fully discussed and the best methods to follow carefully explained.

You will find the book well worth having. Write for your copy today. Please use the coupon below.

"Layering" Old Thompsons Tried for Quick Renovation

LAYERING to preserve the productivity of Thompson Seedless vines is an expedient being tried on the old Mason-Osborne vineyard west of Fresno. A. E. Way of the University of California viticultural department is to do the work on one row in the vineyard to demonstrate the advantages and disadvantages of the plan.

"Layering" is simply bending down one of the long canes and covering it well with earth to let it take root. Mr. Way will bend a long cane over to the middle of the space between vines, burying it in the soil, and will leave the last bud exposed to grow and form a new top. When the layer is two years old and thoroughly rooted, it will be cut loose from the parent vine, and will be trained as a new vine to take the place of the old one, which will be gradually pruned back and finally removed altogether.

The advantage of the plan is expected to be that the owner will get returns while the new vines are coming on.

Crops will be borne by the old vine until the new is ready in some measure to replace it.

The condition of some of the older Thompsons is found to be unsatisfactory in the Fresno area. The vines are practically all living, but the vitality and fruitfulness of many have been impaired. Careless pruning is largely responsible. Some of the Thompsons are almost as rotten as some of the old Muscat vines. Vines that might have lived a century are failing to keep up their production in some cases at 30 years. Arching the canes outward is one of the methods of making the crop heavier, as more sunlight is let into the vine. This also increases the vitality.

While layering will probably prove of benefit, it seems more than probable, according to Mr. Way, that the better way to renew an old vineyard is to dig it out altogether and plant the ground to alfalfa for a year or two, then replanting to vines.

Proposed Quarantine on Citrus Fruits

A public hearing on the proposed quarantine on imported citrus fruit will be held at the department of agriculture Washington on May 8. The proposed quarantine is due to the fact that citrus canker is known to exist in eastern and southeastern Asia, the Philippine Islands, Oceania, Malayan Archipelago, Japan, and South Africa, and that fruit infected with the disease is being imported into the United States from these regions. If adopted, the quarantine will prohibit the further importation from these sections of such fruit as oranges, lemons and grapefruit.

The commercial importations from the countries affected by the proposed quarantine are so small at the present time that the chief danger is believed to consist in small lots of fruit brought in for personal use by returning travelers. As a precaution against the introduction of citrus canker into this country, the importation of citrus plants has been probibited since December of 1914. The disease however, can be brought in on fruits as well as on plants.

Citrus canker has already made its way into the gulf regions of the United States, presumably in 1911, from the Orient. The federal and state authorities are now fighting the disease, and a vigorous attempt to exterminate it by the burning of citrus trees is being made, with prospects of success in several of the infected states. The campaign is expensive, however, as it involves the burning of between $5,000,000 and $10,000,000 worth of citrus trees. Moreover, the western fruit districts of California, New Mexico and Arizona are still free from the infection and every effort is being made to keep them so.

Raisin Day

All California, and we hope all that portion of the world which is able to eat, will observe next Monday with songs, dancing and eating of raisins. It is Raisin Day at Fresno, the raisin center. Miss Madison, daughter of the former manager of the California Associated Raisin Company, will direct processions, games and control generally the festivities. In California the day will be largely one of joyous holiday but the greater observation of the day will be in the dining rooms all over the land, for it is sure that everybody will eat and drink raisins.

Page advertisements are being carried in nearly all Eastern newspapers. Here are a very few of the arguments used in some of these advertisements:

Eat More Raisins.—Eat cluster raisins with nuts after dinner. Eat raisins with your beakfast foods—with shredded wheat, corn flakes, puffed wheat and rice, etc. Serve raisins in fruit salads. Garnish dishes of ice cream with raisins. Let the children have them as sweetmeats. Raisins are nature's healthful candy.

Cook More Raisins.—Cook raisins with your apple sauce, oatmeal and boiled rice. Cook them in your Indian pudding, rice pudding and bread pudding. Stew raisins and prunes together, or alternate stewed raisins and stewed prunes. Raisins cooked with peaches and other fruits add both variety in flavor and food value.

Bake More Raisins.—Bake breads, cakes, muffins, gems, biscuits, cookies, pies, etc., with Sun-Maid Raisins. A California Raisin Pie made with Sun-Maid Raisins is delicious. Raisins and cranberries in a pie make a luscious combination. Try good old-fashioned corn bread filled with raisins. Try famous California Raisin Bread, made with Sun-Maid Raisins—the national raisin bread—it's good and good for you. Your dealer has it. Send for free recipe book which describes scores of ways to serve Sun-Maid Raisins.

State Fruit Growers Convention

State Comissioner Hecke and a live wire committete at Riverside are making every preparation possible for a great State Fruit Growers' Convention to be held at Riverside June 4-8. Riverside is a beautiful place and ample accommodations are assured. The program is not yet announced. We assume it will be largely tinged with discussions as to the state's fruit culture. However, many of the graver questions of today will have place on the program. Riverside is saying "Come, a genuine Riverside welcome is here for you."

Greater Production

The California Development Board is holding its annual convention at Stockton, April 27 and 28. Representatives of chambers of commerce, boards of supervisors and prominent men from throughout the state are in attendance. For several years the development board has been gathering scientific agricultural information of the state and the subject of this convention is devoted entirely to a discussion of ways and means of devolping the intensive agricultural resources of California and conserving the product.

Two Great Beef Cattle Sales

Written for the California Cultivator By M. C. Holman, Manager of the Northern Office at San Francisco

CALIFORNIA is in line for two of the biggest live stock events since the Panama-Pacific Exposition show of celebrated live stock of all classes. Two live stock auctions are to take place next week and they are coming right together as to time and place. They are to be held at Mayfield. Mr. Carruthers' sale of registered Scotch Shorthorns will take place on Wednesday, May 2, and the sale at the D. O. Lively stock farm of registered Herefords will be held on the following day, Thursday, May 3.

Bringing into line for these sales of two popular beef breeds of cattle is a declaration of the fact that American, and particularly California, live stock men are recognizing that what is of greatest value in live stock circles is breeding for beef. It is one thing to breed for milk, and that is commendable. We couldn't get along without the milker. But it is quite another thing to breed cattle that will not only be good milkers, but will, at the same time, be loaded down with good chunks of delicious meat, which, at this time, is bringing exceptionally good prices over the counter.

The Shorthorns and Herefords have many similar characteristics. They are stockily built, are set low and rest on four chunky legs. The broad foreheads are characteristic of the two classes, the necks are short and heavy set, the hair is curled over the bodies, the backs are straight and there is a masculinity about both breeds that is particularly pleasing and suggestive of great strength. The greater the masculine features predominate the better calves they will have.

One of the main features which characterize these two great breeds is that when used on any herd they will greatly improve the quality of the calves and eventually will round the herd out as a good beef maker. They are also good feeders and will turn their food into beef quicker than any other breeds. They are good rustlers and will find their feed on the range with great ease, whereas other breeds need to be handled with great care in this particular.

Breeders have their own particular favorites, and the breeders of Shorthorns and Herefords are no exception. A Shorthorn cow will lose weight when suckling her calf, but this is a commendable fault in that she will give of herself that the little one may have plenty of nourishment and round out for a good start on the road to utility. The Shorthorn is quiet and gentle on the range and in the corral. The Shorthorn is ideal in conformation. It is the type of animal that breeders are striving for and they are taking him as the model. The Shorthorn possesses the size, bone and heavy hind quarters which are desirable features in beef breeds. It is claimed that the Shorthorn will put on more meat for the amount fed than any other breed.

Our Hereford friends claim that the Hereford makes the cheapest beef and that they are the best grazers. It is also claimed that the Herefords mature the quickest and become ready for market with the least possible care; that they are the best mothers and the most prolific, each herd having a crop of calves with the greatest regularity. They will utilize feed that other breeds cannot utilize and will fatten in good shape where others would be unpresentable. The Herefords are said to bring better prices as beef and to be freer from tuberculosis.

In color the Shorthorns are roan, white and red, with the roan predominating and being considered a particular favorite. The Hereford is characterized by the white face, with a white strip extending from the mouth, down the neck, under the belly and terminating at the tip of the tail, with the feet also white.

Whatever may be the claims of and for these two great breeds it remains that their primal qualities are such as to commend them to any breeder who is desirous of improving his herd for beef production. As individual breeds they stand without rivals in the beef class.

These two sales should be record breakers in attendance. Those interested in Shorthorns only will have a chance to see what a Hereford is like by waiting over one day and attending the Lively sale, and those who can see only the Hereford should make a point of being at Mayfield on the second to attend the big Carruthers sale of Shorthorns.

Full detailed reports of the sales will appear in the Cultivator.

Holstein-Friesian Association Reorganization Meeting

Written for California Cultivator By C. A. Briggs

A LARGE number of Holstein breeders attended the meeting called for adoption of new by-laws and election of directors for the California Holstein-Friesian Association held in the ball room of the Hotel Hughson at Modesto the evening of April 18. J. W. Kiesel, the president, called the meeting to order and stated the objects for which the meeting had been called.

The report of the by-laws committee was read by Secretary K. W. Abbott. A witty welcoming address was made by J. W. Davison, president of the Stanislaus County board of trade. This was followed by a number of addresses. Notable among them were those by Dr. Chas. Keane, state veterinarian, on the "Work of the State Veterinarian in Relation to the State Dairy Laws"; Peter J. Shields on "Ideals in Breeding by Breeders with Ideals"; J. M. Henderson on "How the Breeders Can Help the Dairy Interests of the State"; Frank Morris on "The Development of Breed Families." F. F. Stonerod in behalf of the Los Angeles Live Stock Show presented its claims for support of the breeders of the state.

Directors chosen were De Lancy Lewis, San Jose; K. W. Abbott, Milltas; Owen Duffy, Napa; K. V. Ridgeford, Knightsen; Glon Gibson, Williams; F. W. Kiesel, J. M. Henderson Jr., Sacramento; F. M. Helm, Fresno; W. J. Higdon, Tulare; H. L. Morris, Woodland; A. R. Magruder, Ripon; A. J. Stalder, Riverside; Jas. J. Jeffries, Burbank; J. W. McAlister, Chino; W. H. Taylor, Santa Anita.

A. R. Magruder was appointed to represent the association at the next meeting of the national association.

The next meeting of the state organization will be held in Napa on May 5, and all Holstein breeders, their wives, sweethearts and friends, whether they belong to the association or not, are urged to attend. The meet will be at the state hospital near Napa City, and Owen Duffy promises a good time for all. Holstein men, don't fail to attend.

DUROC-JERSEY RECORD

The National Duroc-Jersey Association reports recording during January of 5132 pedigrees and receipt of 96 new members. The association is taking on a larger program this year and will promote three different kinds of futurity shows; the National at Omaha, state futurities and district futurities. Any breeder is eligible for the National, one state futurity and one district futurity.

The National futurity carries a classification of $1000 and there must be 30 herds nominated; this show will be in connection with the National Swine Show. State futurities carrying classifications of $400 each, will be promoted at the California state fair.

DON'T FAIL TO ATTEND THE

Great Shorthorn Sale

AT THE

CARRUTHERS FARM, Mayfield,

next WEDNESDAY, MAY SECOND

46 Registered Red and Roan SHORTHORNS
9 Bulls and 37 Cows

The bulls, cows and heifers offered at this sale will mean a big improvement to any herd they enter. They are the CHOICE STOCK of the CARRUTHERS FARM, and their breeding has been the result of scientific selection. They will perpetuate their good qualities.

ON POINTS THEY SCORE AS TOP NOTCHERS FOR BEEF PRODUCTION AND SHOW RING CHAMPIONS.

CHARACTERISTICS: Well set horns, broad forehead, body set low on stocky legs, a good tufted coat, well rounded loins and great meat bearers.

Save the Little Pigs!

Clean, healthy little pigs grow into profitable hogs. With B-K the POWERFUL disinfectant (NOT A POISON) you can easily keep the little pigs clean and bright, prevent face scab, lung fever, cholera and bowel trouble by disinfecting pens, animals, feed and drinking water. ALL authorities agree that disinfecting is absolutely necessary, to protect hogs against cholera, and the records show that hundreds of breeders have safely protected all their hogs by using B-K when the hogs of neighbors were dying from Cholera. B-K disinfecting does not interfere with the use of serum but more than doules the protection. Germ diseases are more easily prevented than cured. Our powerful non-poisonous germicide will save you hundreds of dollars per year if you are raising hogs. If your dealer does not have B-K, send us his name.

Northern California Live Stock Notes

Written for California Cultivator By W. S. Guilford

FARMER-PATRIOTS

IN the present crisis any one is a patriot who does anything to help to bring victory to the United States and the Allies. The food supply of this country and the world will undoubtedly be the biggest factor in bringing about the desired result. It can therefore be truthfully said that at this time the one who can do most to conserve and increase the food supply of the nation is the greatest patriot.

Let us do a lot of figuring on this. Is there a corner of a field that is now unproductive that can be made to grow some corn or grass or potatoes, or anything that will be feed for man or beast? Could a few sheep be matured on weeds or along roadsides or on feed that would otherwise go to waste?

The extra care or the hours of sleep lost in giving the sow attention that will result in saving the life of pigs is patriotic service.

There are many ways in which energy can be expended along this line—let us all be busy.

It is stated that during the Civil War many farmers left the plow standing in the furrow to enlist in the war, and that the plow stood where it was left until after the war was over. Thousands of acres were unproductive during the entire period of the war.

The present food supply of the world demands that such things as this be not done now. Instead of leaving the plow the patriot is the one who will plow 14 hours a day instead of nine and who will do everything in his power to grow the largest possible crop in 1917.

A GOOD KIND OF SOW

I visited one of the great hog breeding farms of the East a short time ago. In going the rounds we came to one lot in which there was a long thin sow with a litter of splendid pigs.

"That sow is a good mother, but isn't much to look at," said the owner, as he started to pass hurriedly by the pen. Then in an undertone to the herdsman he said; "We should put this sow in a back lot somewhere."

But she looked good to me and I wanted to know more about her. I found that she was a young sow, this her third litter, that she was sired by one of the best boars now living, that she had never been shown, had been bred young and regularly, raised 12 pigs in her last litter, had never had time to "grow out", but some of the best pigs on the farm were hers, and some are likely candidates for the fall show herd.

I said "What is the price of this sow?"

"Oh, we don't want to sell her," was the reply.

"But if you did want to sell her what would you probably ask?"

"You would think we were joking if we told you, for she don't look the price we would have to ask."

"Well, anyway, what would it be?"

"Five hundred dollars would be the price, but she is not for sale."

Now at that price she might have been the cheapest thing on the place. The neighbors might make fun of the man who had the nerve to buy her—but what a foundation animal for a herd she would be.

A LAMB CREEP

The Cultivator has had a lot to say during the past two or three years about small flocks of sheep for small diversified farms. And I have yet to learn of any who have started these little flocks who have regretted it. On the other hand there are many who wish they had started such flocks and who will buy a few ewes at the first opportunity.

As soon as the lambs are big enough to eat a little grain and hay it is a good idea to fix a little pen into which they can creep and the ewes cannot. In this pen, or creep, put some alfalfa hay and a little grain, corn or rolled barley, and a big increase in their weight will be noted. This is when the lambs are to be made ready for market at the earliest possible time.

WORMY HORSES

Horses may have so many worms that they cannot digest enough food to keep both the horse and the worms thriving. Then the worms get the best of it. Dr. Backus of Missouri suggests the following worm remedy. Powdered nux vomica 2 ounces, powdered gentian root 4 ounces, powdered areca nut 6 ounces, sodium chloride 8 ounces, arsenious acid 2 drams. Mix. Give one heaping teaspoon to every 250 pounds weight night and morning for ten days. Mix the medicine in the grain.

While the treatment is in progress feed the horse lightly so the medicine will have a chance to work on the worms. And give loose feed—like bran—to keep the animal's bowels open.

With the extremely high price of feed no parasites of any kind should be fed. Make war on worms, lice, ticks and all sorts of vermin that live on the blood of domestic animals.

WATER FOR 36 HOURS

More pigs are killed by overfeeding the sow immediately following the birth of the pigs than any one has an idea. And this practice is of the greatest danger to the best heavy milking sows that should raise the top pigs.

If every hog raiser would see to it that the sow gets nothing but warm water for 36 hours after farrowing the total number of pigs raised would be greatly increased.

THE MATURE YOUNGSTER

"What a pretty colt," is an expression sometimes heard in the show ring or on the farm. The same applies to the young of other classes of live stock.

And, too frequently the animal so praised is not as good from the standpoint of future development and perfection at maturity as the ungainly long legged, but vigorous and growthy youngster that does not look so good while young and in the growing period. It is the same with animals as with children. Sound judgment of imma-

W. F. Young, P.D.F., 244 Temple St., Springfield, Mass.

Retained Afterbirth

When the membranes remain in the uterus of a cow and decompose, inflammation of the lining of the womb may be caused, and this, with the absorption into the blood of the products of putrefaction, lead to ill-health, emaciation, diminished milk supply, failure to breed, and often blood poisoning and death.

HOOD FARM BREEDING POWDER causes the afterbirth to come away naturally in a few days, and thoroughly cleanses and disinfects the parts, leaving the cow in normal condition for breeding. Write for full information and prices, mentioning this paper.

WORM REMEDIES FOR HOGS

A cheap and effective remedy for worms in hogs is in demand by many growers. Santonin and calomel are almost prohibited because of war time prices. Now comes the Nebraska station with the information that one to three teaspoons of kerosene per pig is an effective worm destroyer. This is worthy trying.

LOOK OUT FOR BLACKLEG

There are reports of blackleg in some of the bottom land pastures in the Sacramento and San Joaquin Valleys. Blackleg is a germ disease; the germs thrive in moist pasture soils. It is easily prevented by vaccination. All young cattle, from three months to two years old, should be treated. Good vaccines are advertised in the Cultivator.

AMADOR-EL DORADO ANNUAL

THE annual meeting of the Amador-El Dorado Livestock Association was held in Placerville on Saturday, April 7. It was one of the largest and most successful meetings ever held by the association. Thirty new members joined, thus bringing the membership up to a majority of the permitees of the national forest, and entitling the association to an advisory board which will be recognized by the forest service. There was a day and evening session, followed by a banquet.

Election of officers resulted in the selection of R. E. Granlees as president; George Waechter, vice president; B. C. Celio, secretary; E. T. Bamert, J. D. Granlees, C. E. Froelich, executive committee.

There was much discussion of legislation now before the senate and assembly in Sacramento affecting range cattle.

The association went on record as protesting against the "Motor Vehicle Act," which would restrict passage of cattle over the state highways to groups of 25, unless granted a permit. A committee appointed to consider the Rigdon Bill and the Ream Bill reported against the Rigdon Bill, endorsing the Ream Bill.

A SUCCESSFUL SALE

Written for California Cultivator
By C. A. Briggs

On April 19 the California Breeders Sales and Pedigree Company conducted a very satisfactory sale of the H. E. Cornwell Holstein herd at Modesto. The day was perfect; the attendance of both professional breeders from all parts of the state and local dairymen, large. Bidding was brisk from start to finish, not a drag in the entire program.

A regular regiment of Colonel's did the honors and kept things humming There was Colonel Rhoades and Colonel Rhoades' father and son and Colonel Clark of Modesto, and their high explosive and rapid fire oratory kept the buyers going strong.

Twenty-eight head sold for $10,740, an average of $383. The top of the sale, Prince Hiske Walker, a splendid bull, went to Walter J. Mitchell of Visalia. He will make himself added reputation in the hands of this practical breeder. Eight hundred and ten dollars gave A. M. Bibens of Modesto possession of the top cow, Abbie De Kol of East Bank 2nd, a fine animal with a good record backing strong individuality.

A feature of the sale was the large number of buyers and the fact that many animals stayed in Stanislaus County. They know good things in Stanislaus. The buyers were W. F. Mitchell, Visalia; H. R. Leek, Alpaugh; A. M. Bibens, W. E. Oakes, G. W. Shirk, J. E. Vann, J. R. Pearson, H. T. Johnson, Wm. Breazeal, R. L. Holmes, L. Schmitz, Geo. N. Pfarr, W. F. Lathrop, G. E. Kunias, H. J. Noland, Geo. A. Caster, Sanitary Dairy of Modesto; Wm. T. Miller, C. C. Hitchcock, Gotchall & Magruder, J. H. Miller, Gotchall Cattle Loan Company of Ripon; H. E. Vogel, Fresno; J. C. Haine, Kaiser Bros. of Ceres; W. J. Higdon, Tulare; Glenn Harter, Escalon.

The Remco Redwood SILO

will enable you to furnish your cows with SWEET, GREEN FEED during the LONG, DRY SEASON.

To have desirable feed means more and better milk with higher prices and a larger income. It is not only economy but sensible business judgment to provide your ranch with a REMCO REDWOOD SILO.

It will more than pay for itself every year and will last a life time.

CONSTRUCTION

The REMCO REDWOOD SILO is made from clear air dried redwood. It is built according to scientific specifications by skilled mechanics using the most approved wood working machinery.

TANKS and PIPE

We also manufacture REMCO IRRIGATION PIPE in all dimensions from two inches to twelve feet in diameter. Water tanks from 500 to 500,000 gallons.

Write us for our instructive booklets on any of the above subjects.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Bruise on Breast

Four-year-old mare has large swelling low down on the breast and in front of the breast bone. It developed inside of two or three days. The swelling hangs rather loosely and there are no indications of any injury. I opened it with a knife and it discharged about a pint of thin bloody liquid, which reduced the swelling some. Can you suggest a cause and treatment for the trouble?—Subscriber, El Monte.

It is not uncommon to see just such swellings as you describe on the breast of horses, caused by leaning heavily against the manger. The manger being just the right height, horses will often lean on it while eating, and a slip with the front feet while in that position will throw the whole weight on the breast bone and cause a deep bruise. Raise or lower the manger, or better, remove it entirely. Open the abscess by cutting up and down in the middle of the swelling, and cut deep enough to allow all the serum to escape. Wash out the cavity once a day with warm water containing a dram of permanganate of potash to the gallon.

Holstein Men at H. E. Cornwell Sale

Unusual Case

I have a cow about eight years old that has failed to get with calf after three servings. A week ago she began to bleed at the mouth and next day the end of her tongue was all black. I cut it off and since then she can only eat gruel made from bran and some fresh alfalfa. She has a thick frothy discharge from the nose like mucous and stringy slobbers from the mouth when trying to eat. Gave her a laxative about a week ago and she seems all right except falling off a little. What was wrong with her and will she recover?—Subscriber, Fullerton.

This is rather unusual and would be difficult to diagnose without a visit to see the cow. Better call in the nearest veterinarian and take his advice.

CALIFORNIA BREEDERS' SALES AND PEDIGREE COMPANY — PUBLIC SALES OF SOUND HEALTHY LIVESTOCK

Production Popular Breeding

Popularity follows production records as a matter of common sense in the breeding of registered dairy cattle, and discriminating buyers will find a wealth of the most popular and productive blood in the

ROSAMOND FARM SALE

Stalder Bros.

Riverside, California

TUESDAY, MAY 22, 1917

when we will sell to the highest bidder, absolutely without reserve or limit,

60 Registered Holstein-Friesian Cows, Heifers and Bulls

It is rare, in the West at least, for such a high class offering to be made from one herd. The sale will include

13 A. R. O. COWS AND HEIFERS WITH RECORDS UP TO 28.07 POUNDS BUTTER IN 7 DAYS.

15 DAUGHTERS OF A 28-POUND SON OF PRINCE GELSCHE WALKER, sire of the California champion jr. 4-year-old Lady Hiske Walker, 34.24 pounds butter in 7 days.

20 SPLENDIDLY BRED HEIFERS AND COWS IN CALF TO A 34-POUND GRANDSON OF KING OF THE PONTIACS.

Bulls

The feature of the bull offering will be a son of the great 34-pound cow Gerben Abbekerk Maid. This young fellow is sired by Prince Aralia Walker, son of Prince Gelsche Walker, and out of a 28-pound daughter of the former world's record cow, Aralia De Kol. The three nearest dams of this fellow average over 31 pounds butter in 7 days, and he is a first class individual.

There will also be sold a choice young son of a 28.91-pound cow. His sire, Prince Aralia Walker.

FIVE SONS OF A 34-POUND SIRE WILL BE SOLD, and they are all out of good dams, and are a fine lot individually.
EVERYTHING OVER 6 MONTHS OF AGE TUBERCULIN TESTED.

Registered Percheron Horses

On the same date we will also sell for Stalder Bros., 16 high class registered Percheron mares, stallions, and colts.

This is a rare opportunity for breeders to obtain high class breeding animals of the very best blood lines.

At the conclusion of the sale of registered stock we will also sell for Stalder Bros.

60 Grade Holstein and Jersey Heifers

a desirable lot of dairy stock that dairymen who are looking for good young stock will find satisfactory.

Sale will be held on Stalder Bros.' ROSAMOND FARM, 12 miles west of Riverside, 3½ miles south of Wineville, California, beginning promptly at 9 a. m., Tuesday, May 22, 1917. Parties arriving at Riverside by train will find free conveyance to the sale at Mission Inn Garage.

Write for catalog.

CALIFORNIA BREEDERS' SALES AND PEDIGREE COMPANY — PUBLIC SALES OF SOUND HEALTHY LIVESTOCK

Field Notes From the Live Stock Men

The offering of gilts in the Thatcher, Ennis & Williamson Berkshire sale at Riverside, May 9, should not be overlooked by hog men who are after young stock for their breeding herds. They are right in type, quality and breeding, and will appeal to any man who knows good hogs. There are some mighty good prospects in the lot.

Notable Ayrshire Records.—Two cows from the herd of J. W. Clise, Redmond, Washington, five-year-old twins, Willowmoor Blush and Willowmoor Bloom, have just finished a year's test with official records averaging 14,509 pounds of milk, 671.95 pounds of fat and 4.63 per cent of fat, which seems a creditable record for twin heifers and shows a high standard of dairy production of the Ayrshire breed. Another record finished at the same time is that of Stonehouse Minnie from Strathglass Farm, which some years ago would have been considered phenomenal, with 16,209 pounds of milk, 615.09 pounds of fat and 3.80 per cent of fat; but new and higher records have in the past few years appeared so frequently that nothing surprises us.

Inquiries from all parts of the United States are being made regarding the determination of the board of trustees of Leland Stanford Jr. University to dispose of the entire herd of more than 300 registered purebred Holsteins on the Stanford ranch at Vina, California. M. H. Tichenor of Palo Alto, who has been commissioned to sell the herd, is replying to all requests for information with the announcement that the entire herd will be sold at auction at Vina on June 5, 6 and 7.

Without doubt the Holstein herd at Vina is one of the best known in the world. Since it was established by the late Governor Stanford a third of a century ago, it has been steadily improved by the introduction of the most notable blood strains. As a result exceptional opportunities will be afforded the advanced breeder and the dairyman to improve his herd at the dispersal of this grand herd. Many of the cows are now making fine records.

During each of the three days of the sale it is expected that fully 500 persons will be in attendance. Because of the limited accommodations at Vina, arrangements have been made for a special train from Chico to Vina each morning of the sale. The return run will be made at the close of the day.

COTTONSEED FOR HORSES

"In the cotton states," says Lehman Johnson in Breeders Gazette, "corn in some form or other, as cornbread, corn cakes, grits, hominy, or ash cake, appears daily on our tables, one of the most wholesome and one of the cheapest foods we can buy. This is not true the country over, and in Europe the use made of Indian corn for human food is comparatively meager. No better time ever existed than during this war to extend the consumption of corn, to the benefit not only of consumers but of corn growers.

"There appears to be a large stock of corn in the country which could be drawn on if the feeding of work animals and the production of meat would permit. All the wheat except some ten to 15 per cent has already left the farms, while some 50 to 60 per cent of the corn crop remains. If there was anything to take the place even in part of this corn held back for feeds and so release a considerable proportion of it for human food, the gain to both the public and the corn-grower would be very great. The cotton plant offers just this solution. Cottonseed meal contains rather more fat than corn, a fair proportion of carbohydrates, though considerably less than corn, and three times as much of the most valuable component of a feed, protein. The most careful and elaborate feeding tests have proved conclusively that the protein of cottonseed meal can take the place of the protein of corn to the extent of at least half the ration for feeding horses and mules. Brood mares have been fed cottonseed meal with marked benefit and at a greatly reduced cost.

"What is needed is a simple rule for the exchange of the protein of the one feed for the protein of the other which can be followed by any feeder. For horses and mules use half of the usual amount of shelled corn and substitute half of this half with cottonseed meal, one pound of meal for two pounds of corn. This makes a rough-and-ready 'balanced ration,' quite near enough for the average man to use in his feeding.

"The price of cottonseed meal per unit of protein is so low, governed as it is more by its fertilizer than its feed value in the cotton states, that there is no farm so remote from the cotton states to which the cottonseed meal cannot be delivered to make the exchange profitable to the farmer. A bushel of cottonseed meal weighs the same as a bushel of shelled corn, 56 pounds, contains about twice as much feeding value, but it never has sold and probably never will sell at twice the same price per bushel. Until it does reach that point, the exchange will be profitable to the corn grower."

DEMAND REGISTRY CERTIFICATE

The following communication has been received from the American Shorthorn Breeders Association:

"We are advised that frequent injustice has been done to western ranchmen who have accepted the word of dealers and shippers of bulls from the Middle West, as to their eligibility for registration. The only safeguard is to require of the seller the registry certificate. It happens that a great many grade bulls are assembled and shipped west and the sellers find it to their advantage to pass them on as "full blood" bulls or "eligible to registry." This assurance on the part of the seller naturally encourages a little higher bid from the purchaser, but such practice is a gross injustice. In short, it is a fraud. If the western buyers will always require the evidence in the form of a registry certificate, they will be able to protect themselves and insure a better investment.

In certain western states legislation has been enacted which makes it unlawful to run a grade or non-registered bull on the open range. This is a positive step in the right direction but can only be effective when there is satisfactory assurance that the bulls purchased as purebred bulls are what they are represented to be—in other words, when the certificate of registry is transferred with the animal.

At the annual spring sale of the Northwest Shorthorn Breeders' Association at Portland last week 86 head were sold at a general average of $277, the heifers bringing an average of $322.

Great Deep-Bodied **Jerseys**

Possessing the pleasing type that makes them at home in the show ring. Willowwood Jerseys are particularly strong in the great depth of body, large, well shaped udders and roominess that makes for large production and regular breeding in the dairy cow.

We will sell at public auction to the highest bidder, absolutely without reserve or limit, this entire

WILLOWWOOD HERD
OF
60 Registered Jerseys 60
Owned by
C. G. McFARLAND, Tulare, Cal.
on THURSDAY, May 17, 1917

on Mr. McFarland's new farm, 12 miles from Tulare, 3 miles from Waukena.

This is without question of doubt the greatest herd of registered Jerseys ever offered at public sale in the West, and one of the greatest ever offered in the United States. The offering will include

13 REGISTER OF MERIT COWS WITH RECORDS AVERAGING 516 POUNDS OF 85% BUTTER IN ONE YEAR.

16 DAUGHTERS OF REGISTER OF MERIT COWS, the average Register of Merit records of the dams being 502 pounds 1 ounce 85 per cent butter in one year, including the records of several 2-year-olds.

16 COWS AND HEIFERS IN CALF TO A BULL BY THE SAME SIRE AS ROSAIRE'S OLGA LAD, who has 19 Register of Merit daughters averaging 526 pounds 3 ounces 85 per cent butter in one year, ages from yearlings up.

4 HEIFERS AND COWS IN CALF TO A SON OF A COW WITH A REGISTER OF MERIT RECORD OF 592 POUNDS 3 OUNCES 85 PER CENT BUTTER IN ONE YEAR.

BULLS

A HALF BROTHER TO ROSAIRE'S OLGA LAD (mentioned above) and out of a dam that is 50 per cent the same blood as Gertie of Glynllyn 2nd, the former world's record 3-year-old, Register of Merit 744 pounds 4 ounces 85 per cent butter in one year.

6 Grand Herd Bulls

All out of Register of Merit dams, and the dams of the eight average 526 pounds 1 ounce 85 per cent butter in one year. These are nice typey young fellows, most of them good enough to go to the head of a good registered herd.

DAIRYMEN! There are mighty few Jersey bulls bred like these fellows in California and if you want a real bull, backed up by higher production than the average of your grade cows, here is the place to buy him.

Every Animal over Six Months of Age Tuberculin Tested

Lake Mills Holstein Sale
AT
LAKE MILLS, WISCONSIN
May 8 and 9

This sale company, known from coast to coast as one of the oldest and most reliable organizations of its kind, has taken great pains in selecting the cattle for this spring's sale.

They offer 175 head of healthy, desirable Holsteins of the most popular breeding, and from first class breeders' herds.

They have a fine lot of A. R. O. cows, heifers bred to 33 and 34½-lb. bulls, and an exceptional lot of choice bulls,—sons and grandsons of King Segis Pontiac.

THREE BIG SHOWS AT COALINGA

Written for California Cultivator
By C. A. Wilkins

Although having been organized only four years, the Coalinga Poultry Association has shown what can be done by cooperation in the way of promoting one of the state's greatest industries. This spirit of cooperation between the association and the community in which it lives is best shown in their efforts to secure the annual state poultry show this year and the manner in which the members have labored to make the show a success.

More than $1000 has been pledged the association by the merchants and citizens of Coalinga who realize the importance of promoting the poultry industry in the Coalinga and surrounding section of the state. This amount is to be used, $500 or more for gold special premiums and the balance for other expenses of the show. Regular cash prizes will be paid in all varieties of poultry, pigeons and pet stock.

Not only will this be the official show of California State Poultry Breeders' Association; it will be the fifth annual show of the Coalinga Poultry Association; official winter show of the California Pet Stock Association; the official show of the Fresno Poultry, Pigeon and Pet Stock Association and of many specialty breed clubs.

The dates for the show are December 28, 29, 30, 31, 1917, and January 1, 1918.

TEST YOUR SEED CORN

Continued from Page 491

As it may not always be possible to purchase seed corn from just the right section, it is by far the best agricultural practice for the farmer to select his own. Moreover, it happens not infrequently that conditions are such in one year that they interfere seriously with the production of good seed corn. For this reason it is the part of prudence for the farmer to save a supply of seed corn that will not only be sufficient for his planting the next spring, but will carry him through another year if the need arises.

SQUASH

Summer squashes are to many an attractive addition to the home garden. Two or three hills will furnish enough for an average-sized family.

These squashes are not fastidious as to soils, though they, like most garden plants, prefer a warm, sandy loam. The most important requirements for success are abundance of manure and good cultivation. The hills may be spaced five or six feet apart. The plants will occupy the ground all summer if the fruits are harvested at usable stage.

In preparing a "hill" for the planting of summer squashes, a hole 2½ feet square and 12 inches deep should be dug; a bushel basketful of manure should then be thoroughly mixed with the excavated soil, which is then replaced in the hole. It is better to use well-rotted manure, but if the mixing with soil is properly done there will be little danger of heating from fresh strawy manure. With chicken manure, use only one-half of this quantity.

Acids are formed in the soil by the decay of organic matter and by the decomposition of soil-forming rocks that are deficient in lime. For this reason some soils are more apt to be sour than others. The formation of acids in soils is favored by the lack of drainage, poor cultivation, continuous cropping and applying fertilizers to soils deficient in humus.

The Public Employment Bureau of California, with bureaus located in San Francisco, Oakland, Sacramento

Home Economy and Satisfaction

Cultivator Housekeepers Tell of Successful Methods of Preserving Vegetables and Meats

CANNING MEATS

Written for California Cultivator
By Mrs. W. E. Borden, Oceanside

I THINK that all housewives like a variety of meat. To get this we can our own.

We butchered a six-months-old calf. This age we preferred because it is cheaper than regular veal and not so rich. Also there is more meat to can. The hide will bring a good price at present also.

Canned Veal

We first roasted a large portion of the meat, then sliced and packed it in jars, covered with gravy and sealed. Second we cut strips about an inch square of all the suitable meat left and placed it in a strong salt water over night. Next morning we hung it on the line in the open air and covered it with cheesecloth to keep the flies off. It will take from two to four weeks to dry thoroughly. It should then be placed in an unwashed flour sack to prevent mold. This is what the Mexicans call jerky, and there is no meat any sweeter than roasted jerky.

Third. All bones and meat left were boiled in fireless cooker with onion and salt. When done some of the meat was packed in jars and covered with stock. The rest we ground up and made into minced meat by adding salt and pepper to taste. This was also packed, covered with stock and sealed. The surplus stock was placed in jars and sealed, to be used for soups and gravies. All of this meat and stock I canned in Economy jars, as they are self sealing and the only jar that I have had absolute satisfaction with in canning meats.

After the jars are prepared as above

For the Orchardist

ORCHARD BRAND ARSENATE OF LEAD PASTE is put up in practicable form, easy to handle and mix with water. It is manufactured so as to prevent settling in a hard mass to the bottom of the containers. It is a soft, fluffy paste which, after diluting in water, maintains the best possible suspension. It insures an even coating of poison, closely adhering to the surface of the fruit and foliage. It gives lasting and effective results. The chemical ingredients are guaranteed.

Some prefer the dry form of lead. For them **ORCHARD BRAND LEAD POWDER** is convenient to use—and effective.

ATOMIC SULPHUR PASTE, a non-caustic fungicide, is safe to use and gives effective and lasting results without injury to trees, foliage or fruit when properly applied. It can be safely combined with **ORCHARD BRAND ARSENATE OF LEAD** when spraying for codling moth control and it is important that it be first added at the time of the calyx spray in order to start the stimulation, which results in increased vigor to the trees, the setting of more uniform crop of fruit and a proper control of mildew.

When thoroughly applied after blooming time at proper intervals, it is also effective in preventing any further growth of scab fungus and will control red spiders and mites on fruit trees.

Atomic Sulphur is the best material known for the control of mildew on all classes of fruit trees, grape vines and ornamental plants.

This is the time of year to use **LIME SULPHUR SOLUTION**—when the buds begin swelling.

ORCHARD BRAND BORDEAUX MIXTURE should be used for the prevention and control of various diseases on apple and stone fruits.

1226 East 28th Street Los Angeles, Cal.

The Pure Fuel Label
RED CROWN GASOLINE

I place them in a false bottomed boiler (wash boiler will hold 14 or 15 jars) with water to necks of jars and boil for three hours. This insures their keeping.

Canned Chicken

It is very nice to have chickens to draw upon to supply your table with meat, but I found that it cost considerable to feed the mature chickens that we expected to use for eating, especially at the present price of grain. My solution of the problem is to raise the chicks until mature enough to use and then can them up in several ways.

First, roast several chickens. When done pack legs, thighs, and breasts in jars, cover with gravy and seal.

Second, boil some chickens, with onion, salt and bay leaf until tender. Pack legs, thighs and breasts in jars and cover with stock. Seal.

Third, backs, necks and wings of roasted and boiled chickens I boned and ground up with giblets, seasoned and packed in jars as minced chicken, covered with broth and sealed. Can balance of broth.

These jars are placed in boiler with false bottom and boiled under pressure for three hours as the meat in first recipe.

I am sure that anyone trying this method will feel amply repaid.

The minced meat in either case combined with mayonnaise dressing makes delicious sandwiches or it can be made into croquettes.

The unground meat should be heated up in the jars before opening to serve if served hot.

Poisoned Beans for Squirrels

Perhaps the following will help some of the famers also.

One of the greatest pests in this country is the squirrel. We have poisoned with poisoned barley—often with little effect. Last year a neighbor told us that the squirrels bothering barley would eat poisoned barley, but squirrels eating beans would have to be given poisoned beans. This is true, for squirrels will leave barley to eat beans.

The price of beans would bring the price of poison high this year.. We solved this difficulty by picking out the broken and wormy beans, using them for the bulk to be poisoned with the government formula of: One tablespoon starch, one tablespoon sugar, one pint boiling water, one ounce strychnine, five gallons barley or beans. Spread out to dry. Poison only when the mornings and evenings are dry, as moisture spoils the poison.

HOME CANNING

Written for California Cultivator
By A. B. C.

THE Cultivator's invitation for a symposium on "Home Canning" is a most welcome one and I expect to receive many useful ideas.

We are right in looking to the garden as a large factor in keeping down the family expenses. In this favored climate we may supply our table with something gathered fresh daily. To add to the variety we enjoy so much and to conserve the surplus in an economical manner, experience has proven we have satisfactory and profitable results in resorting to canning and other processes.

The essential principles involved in canning vegetables are few and simple: First. They will keep if sterilized against molds, yeasts and bacteria; second, molds and yeasts are destroyed by heating to 212 degrees Fahrenheit; third, acid prevents the growth of bacteria. Success is measured by the faithfulness in applying these principles.

The use of acid is the fundamental in the new process of sterilizing vegetables evolved in the labratory of our state college of agriculture, Berkeley. The report is given in "Circular No. 158". Send for it, study it, follow it and this time next year we might compare notes with profit.

Practice has taught that canned vegetables are harder to keep than fruit; that tomatoes keep readily, that chance combinations of tomatoes with corn, beans, peppers, etc., keep nicely. The circular explains the reason for our experience as the action of the acid, and now we may proceeed with assurance using the acid of tomato or lemon.

Have jars, rubbers and all necessary supplies in readiness first. The "Ball Sure-Seal" (glass top and wire clamp) is my preferred type of jar. Rubbers boiled one hour or more in solution of one teaspoon baking soda and one quart water, rinsed, boiled again in water with little lemon juice or vinegar, then in plain water insures against the unpleasant rubber taste being imparted to the food.

Quoting from the circular are these two recipes for sweet corn and peas.

Sweet Corn

Cover corn cut from cob with syrup made from eight ounces sugar, one and one-half ounces salt, six ounces lemon juice per gallon of water. Heat to boiling, fill into jars hot, seal and sterilize in boiling water bath for one and one-half hours.

Peas

Tender, shelled peas are blanched in boiling water one to four minutes, long enough to wrinkle skin slightly. Fill into jars, cover with hot brine of two and one-third ounces salt, three and one-half ounces sugar, seven ounces lemon juice per gallon water. Seal and sterilize one hour.

A favorite tomato product with us is:

Condensed Tomato Sauce

Peeled ripe tomatoes are cooked tender and strained, evaporated to a thick consistency and sealed. It keeps well and is so rich a little goes a long way and is handy in making tomato bisque soup or adding flavor to other soups and sauces. It may be varied with addition of a little onion juice or celery tops, sweet peppers, etc., also to be strained out.

A "near" canning old time favorite is:

MACHINERY
OF EVERY DESCRIPTION
BOUGHT and SOLD
BUTTRESS & McCLELLAN
205-7 N. Los Angeles St. A-5473 Bdy. 8038

The Lehigh Valley railroad is running a potato special through New York and Pennsylvania.

Uncooked Relish

One peck ripe tomatoes, peeled, chopped and drained; two cups each chopped onion, celery and sugar; one cup white mustard seed; one cup salt; two teaspoons each ground cloves, mace and black pepper; four teaspoons cinnamon; four sweet red peppers seeded and chopped; three pints good vinegar. This requires no cooking and keeps without sealing. Wide-mouthed bottles may be used, a small piece of horseradish placed on top or a sprinkle of cinnamon. Sheet cotton with oiled paper makes a good cover tied on. This relish is nice served over baked beans, Lima beans, or on lettuce makes a quick salad. May also be used as Worcestershire sauce flavoring soup, etc.

Ripe Olives

Ripe olives cured are canned by sterilizing in weak brine at about 176 degrees Fahrenheit for 20 minutes filled into jars and sealed. Keep well and flavor unchanged.

Shelled Walnuts

Walnuts shelled, put through food chopper, seasoned lightly with salt are pressed into jelly glasses and covered with a paraffin. Good sweet nuts keep well for months, and nice to have at hand for sandwiches, salads, etc. Halved tomatoes sprinkled with nuts are attractive and tasty served on lettuce leaves.

Dried Vegetables

Our dried products give excellent satisfaction, save jars, etc., and keep well.

Tender sweet corn boiled on ear not more than eight minutes, cut from cob and dried in solar drier or on plates in oven not hot enough to color and stirred.

Green peas or green Lima beans are boiled one to four minutes according to size and dried like corn.

Sweet peppers and okra are "natural driers".

Celery tops, mint, sage and other herbs are useful dried. Parsley dipped in boiling water and dried quickly retains its fresh color.

The green Limas dried are delicious and different from the mature Limas. Fine to take on camping trips, as they soak and cook much quicker than the mature ones and more portable than canned goods.

Cooking Hints

Try cooking green Limas till tender in plenty of water, thicken with shredded wheat biscuit ground in food chopper, season lightly with salt, adding a little good quality cottonseed oil and you have a treat.

Cottonseed oil gives a meaty flavor to vegetables and vegetable soups, gravies, etc., costs much less than olive oil and compares well in analysis.

In the Hubbard squash, good Mother Nature presents us with a product of her canning. The shell rind protects the sweet pulp so perfectly that if handled with a little care from field to storing place we may enjoy them all winter into very late spring.

In serving our mature legumes; Limas, small beans, etc., do not think of them as "just vegetables." They are so rich in proteins (in a form so clean and sweet) let us consider them as vegetable meat, lean meat, and add a little cottonseed oil. Serve in small portions as a sauce or gravy, mashed and thickened with pulverized rolled oats or shredded wheat crumbs, sometimes adding a little onion. This with well cooked rice (or oatmeal), Hubbard squash, mustard greens (or beet tops), and dessert of baked apples or fruit sauce and home baked bread and butter rounds out a meal that not only tastes good but meets every dietetic requirement. Count the cost for even a large family and it makes me smile about the menus based on the "cheap cuts of meat". Try it and you will smile, too. In fact the less meat and more vegetables used tends to smiles all around for more than one reason.

Whatever our preferences, let each of us bring to the table two sauces to accompany the cook's efforts. One, the sauce of an appetite gained from happy, useful work; the other—the sauce of thankfulness.

PRIZE WINNERS

Winners of prizes in this month's contest are: First A. B. C.; second, Mrs. W. E. Borden, Oceanside.

The price remains the same!

The nation over!

SLACKED LIME--GYPSUM Price Right for Large Orders

H. B. MATTHEWS, 350 Woodbury Rd., Pasadena, Cal., R. D. 1, Box 460

Milkoline

The most wonderful feed-stuff preparation. Its basic element "Buttermilk" is not new—but long endorsed by Feed Experts, U. S. Gov., and State Authorities as greatest Poultry Feeding ingredient known. **MILKOLINE** is just as different from buttermilk as a diet for Poultry as Corn Bread is from Corn Meal as human diet. **It's Condensed**—One Gallon **MILKOLINE** equals 50 Gallons ordinary buttermilk. **It's Medicated**—Oil of Sassafras and other beneficial tonics add Health and Vim. **It's Modified**—making it keep indefinitely and perfectly Summer and Winter.

The LIFE LINE IN THE CHICK LINE

MILKOLINE

PURE CONDENSED MEDICATED MODIFIED BUTTERMILK

THE MILKOLINE MFG. CO.

MILKOLINE — PURE CONDENSED BUTTERMILK FEED ⇔ HEALTH — WILL POSITIVELY PREVENT and STOP WHITE DIARRHOEA

Stops dreadful disease which kills half chicks you hatch. Prevents awful bowel trouble which takes so much of Poultry Profits. The Bowels of little chicks are just as sensitive as those of the human infant. Modified sweet milk is the best known preventative for infants—and modified buttermilk—**MILKOLINE**—is the only absolutely safe preventative for chicks.

MILKOLINE — PURE CONDENSED BUTTERMILK FEED ⇔ HEALTH — ABSOLUTELY MAKES CHICKS GROW FASTER

You can feed it alone—but recommend that you mix little in all your chick feed. 20 to 25% of **MILKOLINE** will positively double feed in value—measured by increased vigor and health, or added growth. **MILKOLINE** will prove happiest feeding experience you ever had—one trial and you'll never be without again. Just as fine for growing and fattening broilers and old fowls. All the large Poultry Packers and Feeding Stations feed **MILKOLINE** extensively.

SEND NAME FOR DESCRIPTIVE BOOKLET AND PRICES— it's **FREE**

Remember—you take no chance, you can't pay for **MILKOLENE** if you don't like it. You're missing something worth while—Write now.

Globe Mills Los Angeles, Cal

Tells why chicks die

E. J. Reefer, the poultry expert, 426 Reefer Bldg., Kansas City, Mo., is giving away free a valuable book entitled, "White Diarrhoea and How to Cure it." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every batch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

The Key to Economy

Written for California Cultivator By Jean A. Koethen

HERE is a problem for the first class in poultry culture: If it takes six hens six days to produce a dozen eggs, how much will each egg cost? Give it up? The answer is dead easy: It will cost more than it is worth. won't it, with eggs bringing less than five cents apiece and feed nobody knows how high.

We are all talking about the prohibitive price of feed nowadays and wondering how poultry keeping can be made to pay. I'm not saying that I know, but here is one thing I am very sure of, and that is that the poultryman who raises his feed is going to find it a lot easier to break even than the one who buys it all. I don't know that it is necessary for him to raise all his feed, either, but the more he can raise the better for him and for everyone.

Economy is a two-sided thing. On one side is the production of the things needed. On the other is the reduction of the need. More feed raised, fewer hens to eat it up. That is, fewer unproductive hens. Eliminate the drones and you are increasing the average production of the flock and diminishing the cost of every egg. Increase the production of the hens you keep and you diminish the cost of eggs still more.

This brings us back to the problem we started with. Which is better, to own six hens which lay a dozen eggs in six days or to have the same production from two hens? There is just that difference in hens. In every flock that has not been carefully culled you will find that three-fourths, perhaps, of the hens do all the laying, and that half of them do nearly all. Commercial poultrymen are more careful about culling and trapnesting, but I don't think I am exaggerating when I say that most farm and back-lot flocks could be cut down one-half without much loss in actual egg production.

Now culling is not a thing to be done in a minute. One cannot say, "Go to, now, let us get rid of the drones," and cut their heads off without more ado. Eliminating drones begins in the brooder. Farther back than that, maybe. T. E. Quisenberry has recently put himself on record with the statement that the first half of the hatch that comes out of the shell contains just about all the chicks that will ever be profitable layers. In other words if you should open up the incubator at the end of the first day's hatching and throw away all the rest of the eggs, you would be better off than if you let them hatch. I think Mr. Quisenberry is putting it pretty strong, but there isn't any doubt many a chick is allowed to live that ought to be put out of the way at once. The chicks that are helped out of the shell, for instance, are probably always a dead loss. The reason they have to be helped out is that they haven't strength enough to get themselves out. These weaklings may die during the first week in the brooder. Many of them do. If they are mothered by a hen she may keep the life in their miserable bodies a little longer. Sometimes they struggle along for weeks, hunched-up, crow-headed creatures. Sometimes they manage to reach broiler size, but if they do, the price they bring never equals what it costs to raise them.

Then there are the cripples. They always die sooner or later, but the kindest thing is to dispose of them at once. And there are chicks that are injured, and sometimes chicks that because of a later start find themselves unable to cope with existence, and develop diarrhoea. These chicks often recover but are always runts. I wonder how much feed we waste every year, feeding these chicks that we know cannot grow up to a normal maturity. There is such a thing as maudlin sentimentalism that is too tender to put a chick out of its misery but suffers it to live on with no pleasure to itself and absolute harm to the rest of the flock.

As the flocks grow from babyhood up toward broiler size there are always some birds that are larger and more active than others. These should be banded as possible breeders. Others lag behind. Sometimes this is because of constitutional weakness; sometimes because of injury or chill, or becau in the struggle for existence the chicks have somehow failed to ho their own. Perhaps there has not be sufficient mothering for them. Son chicks can get along without mu mothering. Some can manage with modicum of feed ,if only they ha change of forage. The chicks we mu keep for layers and breeders are t chicks that can only be killed by club or some equally unescapable ac dent. The delicate ones will do f broilers, but get them by themselv and on a fattening ration as soon they can be segregated. The soon they are out of the way the more roo and the more feed there will be f the rest.

It is hard sometimes to put a bi of good color and shape among t culls just because it lacks vigor, b now is no time for shillyshallyin Either put the plant on a paying bas by the elimination of the unfit or l it go into the discard without whinir

Reduction and Production

Reduce the flock by eliminating a but the fittest. Produce the feed th consume. Even then it costs som thing, costs a good deal, in fact. Y may need more land for this, but the is plenty of vacant land near yo Rent it. You may not be able to rai much barley, but you can raise ka and milo, both excellent poultry feed and all sorts of vegetables, which w help out amazingly. Sugar beets, ha sugar beets, mangel beets, cabbag kale, rape, Sudan grass, are all va able for green feed, and all conta considerable protein and more or le carbohydrates, which means that th take the place to some extent of grai

It is a problem we all have to wo on, the problem of cheaper feed f poultry. It may be we shall find th hens can subsist and produce on gre feed and vegetables balanced wi beef scrap or fish scrap with a ve meager addition of grain. We ha already found that they can mana with a far smaller quantity of ha grain than we had supposed. Perha we may in time eliminate most of t ground grain as well. I only ho we shall not be as unfortunate or short-sighted as the man who reduc the feed of his horse to a single str a day. If the horse had not happen to die just then a new era in sto feeding might have begun.

Here is your slogan then for t spring work: "Cull and plant." C every possible drone out of the floc Plant every available foot of land something. Prices of eggs and poult are going to be high. There is a gre opportunity ahead for the poultrym who can keep down cost of productio The poultry industry is going to l hereafter on a footing it has nev reached before. But we must by a and all means keep down the cost production. That is the sine qua no

HAY

Under date of April 21 Scott, Magner & Miller say:

Receipts past week 1378 tons, last week 1589 tons. Most of this from Oregon and Washington from purchases made by dealers during the last 30 or 40 days. Were it not for the hay from Oregon the amount of hay coming into this market would be practically nominal. Consumers are backward in taking to this Oregon and Washington hay as it has not the appearance of our California product although it is claimed that it is of equally good feeding quality. However, it is only a matter of a short time before it will be necessary for consumers to feed this hay or go without. New crops are backward, from two weeks to a month later than usual. New first cutting alfalfa will probably be available about the 15th to 20th of May for the first arrivals, but this will not be used in any quantity for horse feed owing to the danger from colic; old hay will have to be fed, therefore, into July at least.

We note an advance in all grades during the past week, fancy wheat having sold at $35.00 per ton.

We quote the average wholesale price of hay in carload lots on today's market as follows, viz:

Wheat, Fy., lt. bales.....33.00@35.00

ECONOMICAL WORK

Regarding successful farming operations with Samson Sieve-Grip tractors. Mr. Oscar Hewitt of Yuba City writes:

"I have had my Model R-12 just a year and I presume you will be interested in it. I have done much work with it. I have 15 acres of my own and work some on the outside with it.

"I also pulled a five foot double disc harrow about six inches deep and it works the ground up fine. I can disc an acre an hour. I also pulled an eight foot roller with 800 pounds of dirt on it and it was no load at all for the Samson Sieve-Grip."

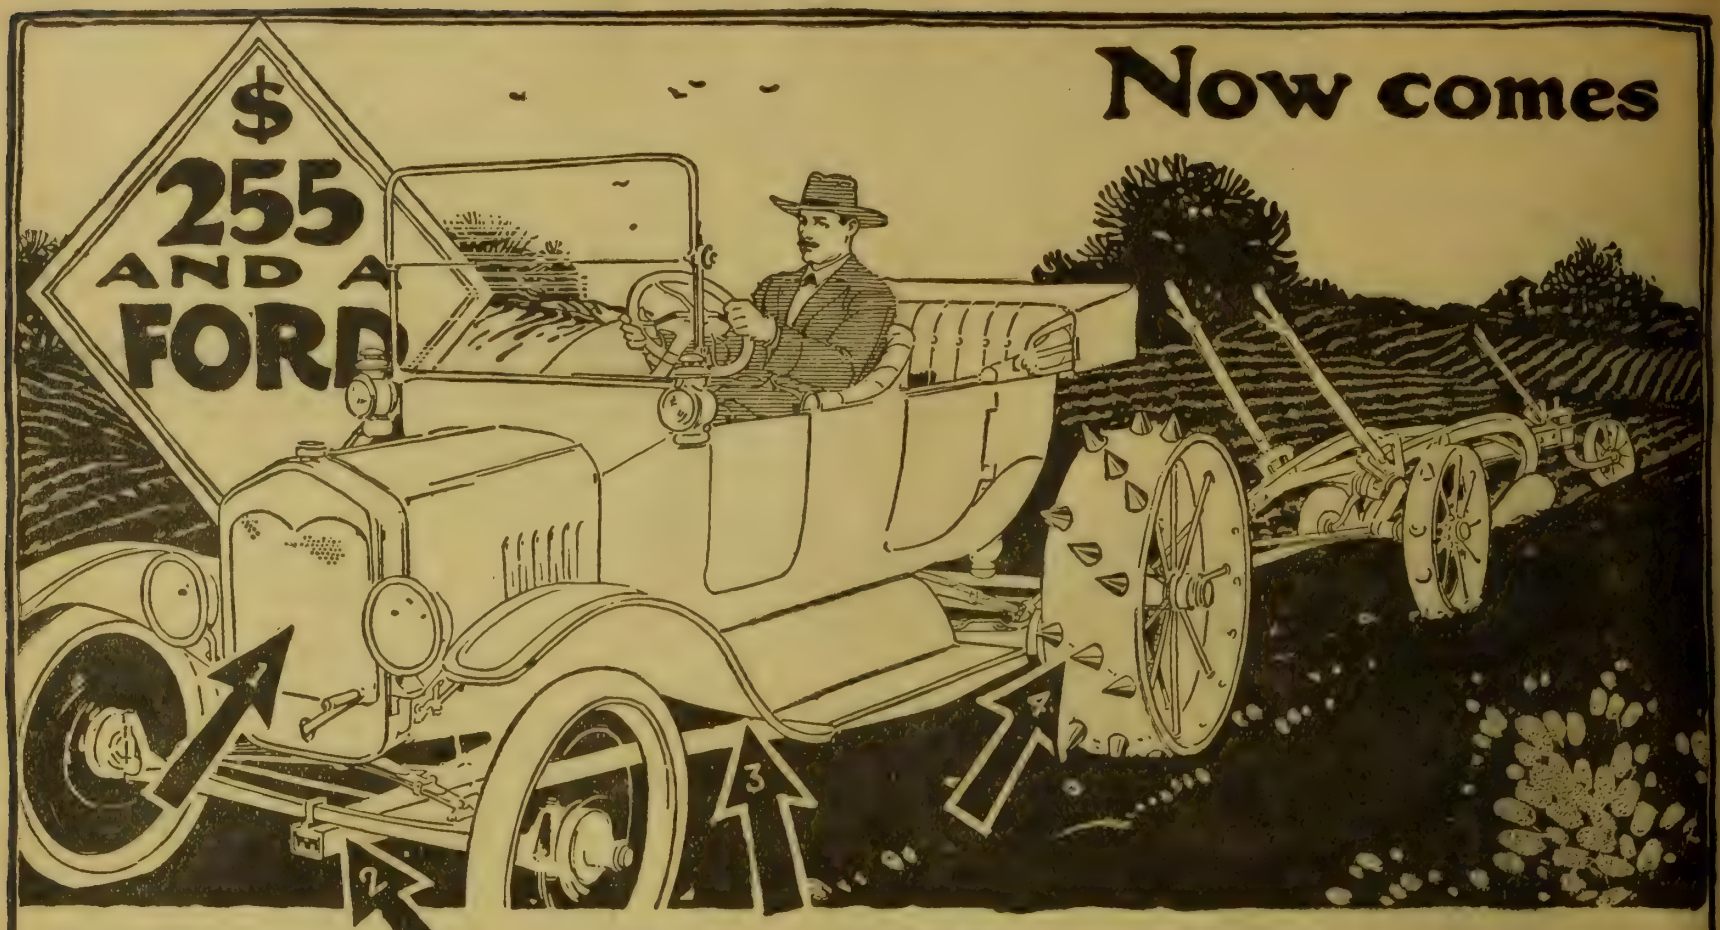
1106 24th Street
Sacramento, Cal.



1 This special radiator—ten times more efficient than the radiator of the Ford—guarantees perfect cooling—without this installation no automobile motor can work satisfactorily as a tractor.

2 Front end of Smith Form-a-Tractor frame fastens to front axle of Ford—a feature of strength and convenience not duplicated in any other construction.

3 Smith Form-a-Tractor frame extends full length of Ford frame, reinforcing it and leaving no part of the tractor attached to the Ford when used as a pleasure car.

4 Three rows of conical lugs—twenty-seven to each wheel—give unusual efficiency in soft soil—distinctive Smith Form-a-Tractor construction.

Smith Form-a-Tractor

Guaranteed To Do the Work of Four Big Horses

COMBINES with any Ford touring car or roadster to make a fully guaranteed tractor, duplicating, in amount of work it will do, the highest priced, biggest tractors you can buy, and giving you the most efficient tractor construction that you can get.

Fifteen minutes will change your Ford to tractor, and it takes only fifteen minutes to make the change back again. The tractor construction is complete and leaves nothing attached to the Ford with the exception of the new special Smith Form-a-Tractor Radiator and the patented Force Feed Oiling System.

Back your Ford over the Smith Form-a-Tractor frame—jack up the rear axle—pull off the Ford rear wheels—replace them with the Smith Form-a-Tractor roller driving pinions—connect up the Smith Form-a-Tractor axle to the Ford axle with special clamps—clamp the front end of the Smith Form-a-Tractor frame to the front axle of the Ford frame, and the conversion is complete. All the work is done by the Smith Form-a-Tractor attachment. The tractor wheels push the Ford ahead and pull the farm implements from the rear. You do not deface your Ford in any way. You do not injure its wonderful ability, but merely utilize its low cost of operation to give the cheapest form of doing farm work.

Use Smith Form-a-Tractor now for

Plowing	Spreading Manure	Cultivating	Grubbing	Crushing Clods
Mowing	Pulling Trees	Smoothing	Packing	Pulling Binders
Listing	Hoisting Hay	Drilling	Rolling	Pulling Stones
Disking	Hay loading	Irrigating	Spraying	Ditch Digging
Dragging	Stretching Wire	Loading Logs	Grading	Hauling Crops
Leveling	Pulling Diggers	Pulling Stumps		

and any other farm work that you have been doing with horses.

Smith Form-a-Tractor drilling—four horse work

50,000 This Year

20,000 Smith Form-a-Tractors are now being built, even before this announcement.

50,000 will be sold this year.

Smith Form-a-Tractors will cut the cost of doing farm work from 40% to 70% on any farm in the country, large or small.

Use Smith Form-a-Tractor for your farm work—Smith Form-a-Truck for your farm hauling, and all the wasteful expense of horses is eliminated.

Wonderful Design

In quality—workmanship—design—materials—Smith Form-a-Tractor gives you tremendous value.

The special cellular type radiator, ten times as efficient as the regular Ford radiator, guarantees perfect cooling in all kinds of work, under all weather conditions. Even on the hottest days you can plow at the rate of seven acres a day with absolute certainty, where horses can only plow 4 acres, with the constant fear that they will drop dead in the harness from excessive heat.

The patented Force Feed Oiling System guarantees perfect lubrication—freedom from burned out bearings, scored pistons. These two features are absolutely essential to proper tractor operation.

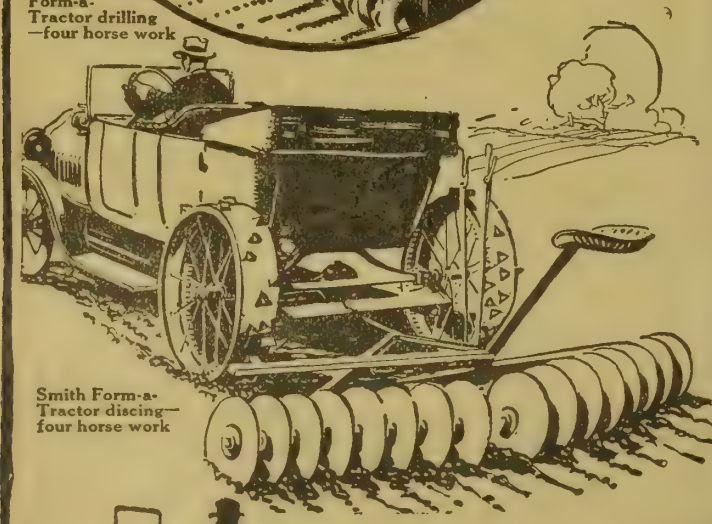
The tractor wheels are exceptionally wide, equipped with strong, durable lugs for service in soft soil, the roller pinions meshing with the bull ring gear of the tractor wheels, are made of nickel steel, heat treated.

The tractor axle is back of the Ford axle. The driving power of the pinions is exerted downward, keeping strain away from the Ford and giving utmost efficiency.

Remarkable Power

Eleven-to-one gear reduction through the use of the Smith Form-a-Tractor roller driving pinion gives wonderful working power. Two and one-half miles an hour in plowing, binding, drilling and all other farm work—eleven times the pulling power of the Ford.

Smith Form-a-Tractor will start and work continuously, hauling a 28-inch gang plow or doing any other four-horse work, and do it all on high gear. We absolutely guarantee this amazing feature of performance.



Smith Form-a-Tractor discing—four horse work

Deliveries Now

You need your Smith Form-a-Tractor now, when you are busiest in the field, doing your hardest work. We can take care of your demands. Our big, complete dealer organization covering every section of the farming territory is ready to supply your demands immediately.

You can order from our dealer in the morning and have your Smith Form-a-Tractor at work, radiator installed, oiling system in, and the tractor itself ready for work in the afternoon of the same day. The first 12 hours you work Smith Form-a-Tractor will show you just what a tremendous saving it will make for you in your farm work.

If you cannot get in touch with a dealer quickly enough, send us the coupon. Accompany it with a deposit of $10 and we will ship your Smith Form-a-Tractor immediately, subject to payment of sight draft attached to bill of lading. Whatever you do, get Smith Form-a-Tractor working in your fields just as quickly as possible.

The Jersey Cow in California

Rich Cow, Rich Man. Dairying Interests as Affected by the Jerseys Touched Upon by Secretary R. M. Gow of the A. J. C. C., by J. M. Roberts, Field Man of the Club in California, by C. L. Hughes, W. P. McClaskey and Others

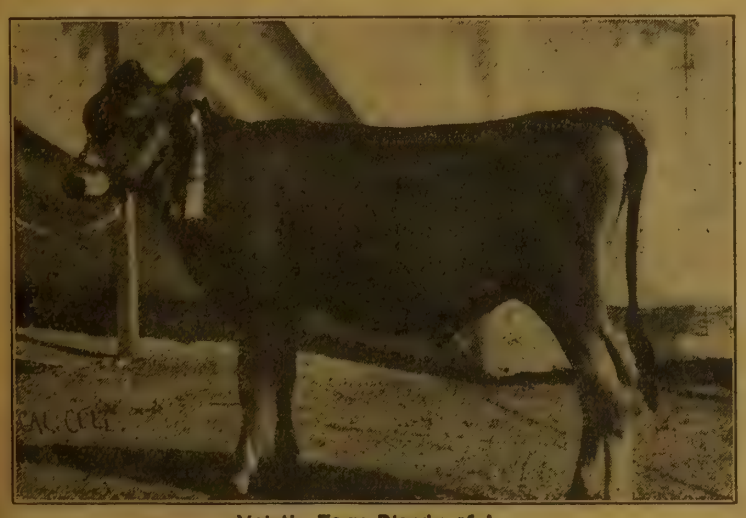
THE UNIVERSAL DAIRY BREED

Written for California Cultivator
By R. M. Gow, Secretary American Cattle Breeders' Association

ONE of the first things necessary to tell people entirely unacquainted with the Jersey breed of cattle is that they did not originate in New Jersey, but in the Island of Jersey, situated near the coast of France in the English Channel, from which New Jersey derives its name. This little island (it is only about eleven by seven miles in extent) has had an influence in the dairy world out of all proportion to its geographical importance on the map. It may be said of Jersey: "The cow has made the island famous." Jersey cattle owners just refer to it as "The Island." With them there is only one island.

This Island of Jersey has a very moderate and temperate climate. It is an universally observed fact that men or animals from temperate climates are best adapted for transportation to other climates, either hot or cold. The Eskimo cannot thrive in the tropics, nor the tropical races in the frozen north. The human product of the temperate zone can stand either extreme. The Jersey cow has had the great advantage of the most suitable climatic nursery to equip a bovine race for the conquest of the dairy world.

The real origin of the Jersey breed is unknown. Wherever the original stock came from, the breed as it exists is peculiarly the product of its island environment, plus many generations of intelligent breeding. The breed has been distinguished for 200 years, but it was in 1834 that the first organized efforts were made to improve it, and these have been continued ever since, first in Jersey, and afterwards in England, the United States and other countries to which it has spread.



Valet's Foxy Blondy of L.

Reserve grand champion Sacramento, 1916, reserve grand champion Fallon, Nevada, '16, and grand champion Modesto, '16. Property of N. H. Locke & Company.

Jerseys were introduced into England before 1800, and England has been a source of foundation Jersey stock for the United States, next to the Island of Jersey. The breed was first brought to America in 1817, but the real foundation stock did not come until 1850, and they have been coming ever since, even in 1917, despite submarines and war conditions. The Jersey is the most widely disseminated of all the pure bred dairy cattle, being well known in the United States, Canada, France, England, Denmark, Australia, New Zealand and Japan, in all of which countries there are Jersey cattle societies for the conservation and improvement of the breed. She has been exported in greater or lesser numbers to a dozen other countries and ocean archipelagos covering the temperate, subtropical and tropical zones of the earth.

The first importations of Jerseys to this country were to New England. From that section she has gradually spread, first South, then to the nearer West, then to the Mississippi Valley, then across the Rockies, and now she has reached the shores of the Pacific Ocean. The Jersey has found her best development in the United States. There are more Jerseys and more owners of Jerseys in the United States than in all other countries combined, and more Jersey owners than of any other dairy breed. Twenty thousand or more American farmers and dairymen who must make a living from their cows are using the Jersey. This is the most conclusive evidence that can be quoted that the Jersey is a profitable dairy animal. Prof. Eckles, of the University of Missouri, very succinctly and impartially summarizes the Jersey and explains her popularity when he writes:

"A good Jersey cow is the model of what is generally taught to be the dairy form. She has pronounced wedge shape, an immense barrel for her size, a well developed udder, and does not carry a pound of superfluous fat while in full flow of milk. Jerseys are easy keepers. The breed is very prepotent when crossed upon common cattle or grades of other breeds. The cross usually partakes strongly of the Jersey type and milking qualities. The heifers mature young. . . . In economy of production of butterfat this breed has always led where opportunity has been given to make fair comparison with other breeds."

The professor might have added with truth that, not only in the economy of production of butterfat, but in the economy of production of milk the Jersey has always led. In the Columbian world's fair tests the Jerseys gave the greatest amount of milk solids-other-than-fat (protein), and also produced butter at the least cost per pound. The Louisiana Purchase Exposition tests demonstrated that the Jersey is the "most economic producer of milk for all purposes of dairying". This has been proved in many tests on less conspicuous but no less important stages. The Jersey cow is a business proposition.

Is this cow fitted for California conditions? That is a fair question. I was talking to a man from the coast and used the words "the California climate". He took me up on that phrase, saying you have about every variety of climate in California. That being so, there must be also a variety of conditions. But I feel sure there is no condition that the Jersey will not fit; for she has proved a paying dairy cow everywhere from Alberta to Texas, from Maine to California, and surely every condition found in California is duplicated within the confines of the United States and Canada, not to speak of the many foreign countries the Jersey is enriching and adorning.

Sacramento Valley Beauties

Jerseys owned by Charles L. Leonard, Glenn County.

In San Joaquin County there is a herd of Jerseys, not one of the famous picked herds of the country, but just a practical working herd operated under ordinary dairy conditions. Last year it included 90 milking cows. In the county testing association it was the only herd of any breed that averaged over 600 pounds fat per cow. One cow produced 11,956.4 pounds milk, containing 637.1 pounds fat, in 311 days. Another produced 12,143 pounds milk, 654.6 pounds fat, in 351 days. Both cows carried calves a great part of the time. They are reproducers as well as producers.

The supreme test of a dairy cow is that she should earn money for her owner. Thousands of Jerseys are doing this everywhere. She has many attractions, but the real reason of her popularity is that she pays.

THE JERSEY ENLISTMENT

Written for California Cultivator
By J. M. Roberts, California Field Agent, American Jersey Cattle Club

COVERING this state under field conditions for the American Jersey Cattle Club it has been found that California is a "somewhat different" state, unlike any other in the Union. The last presidential election will substantiate me in this. Her North is entirely separate from her South, her central valleys do not know what the coast is doing, and the Imperial Valley takes but little interest in the doings of Sacramento Valley. Our labors are therefore centered upon the task of linking California into a workable unit. You will find the breeders of live stock in Missouri, Michigan, Wisconsin, or New York pulling harmoniously together, but this is not so in California. This condition seems to exist simply because we have not attained that degree of proficiency that comes through continued cooperation and organiaztion. It therefore behooves, not only the Jersey breeders, but all breeders of pure bred live stock in California, to enlist in all movements of cooperation and organization, if we are to attain the ranking that our natural resources are offering us.

It probably has not been brought home in impressive fashion, just what the American Jersey Cattle Club is doing for the breeder in every state in the Union, to further this spirit of organization. What they have accomplished in the past year is to be doubled this coming year. California has felt only a slight effect of this work; it is pioneer work of the first order in this state and will take time.

The five leading Jersey counties are as far apart as the boundaries of this state will permit. Stanislaus County, in the center of the state, harbors approximately one-fourth of the total number of Jerseys; Los Angeles County, in the south, Humboldt County, in the north coast region, and Imperial County, in the extreme south, each have about one-third the number of Stanislaus County, with Tulare County fifth. Definite figures as to the number of Jersey cattle in California are not available, but 25,000 can be taken as a safe estimate. So the task of assemblying this army of men is no one year job.

As a starter a series of local Jersey breeders' organizations are being formed. The Jersey Breeders' Association of Southern California recently organized at Riverside, the Orland Jersey Cattle Club, just formed at Orland, and the Humboldt County Jersey Breeders' Association at Ferndale are a few of the pioneer community organizations, together with the California Jersey Breeders' Association as a nucleus, that are expected to bring the California Jersey breeders closer together. An association in Imperial Valley and the lower San Joaquin should complete a very impressive and working unit.

The importation of new Jersey blood into California during the past eight or nine months has surpassed any two years in the history of the breed in this state. Two importations of sires stand out prominently as having the best influence on the coming generation. Jacoba's Emanon from the Roycroft Farm at Sidnaw, Michigan, has been added to the herd of Dr. H. W. Hand of Glenn County. Jacoba's Emanon is a proven sire with several daughters in the Register of Merit, and comes as a welcome addition to our state. The yearling bull, Oxford Majesty's Gold Link, has been added to the beautiful orange grove and dairy ranch of Mrs. C. D. Perry at Riverside.

Continued on Page 516

Speed Up the Haying

WHEN the mower has once started its work, every hour of good haying weather is precious. That is why it is good business to use **International Harvester** hay tools, which, in good curing weather, will put the hay under cover, well cured and in prime condition, in **four to five hours after cutting.**

With an **International, Keystone,** or **Osborne** left-hand side-delivery steel rake you can follow closely after the mower, piling up two swaths at a time on the raked stubble, into a light fluffy windrow that allows free circulation of air through the hay, curing it completely and quickly.

Now the hay is ready for the barn. The final step in speeding up is made with an **International, Keystone,** or **Osborne** mechanical loader—the quick, easy way to rake the field clean without threshing leaves and blossoms off the hay. These loaders are made in types and sizes for all different haying conditions, and can be obtained from local dealers.

We will gladly send full descriptions of any of these good **International Harvester** hay tools on request. The lines include side-delivery rakes, loaders, tedders, sweep rakes, stackers, and combined sweep rakes and stackers.

Securing Organic Matter in Orchard Soils

By J. R. Mattern

STARING every orchardist in the face is the problem of getting sufficient vegetable matter into his soil to keep up proper moisture and fertility conditions. It is a well known fact among modern soil experts that organic matter has a great deal to do with the moisture storage capacity of soils, and in connection with moisture the organic matter determines the bacterial activity in the soil, and therefore the amount of natural plant food available.

On a grain or stock farm the problem is simpler, because there are no trees to hinder free cultivation with broad implements, and no roots to interfere with deep plowing. Once the trees are started the ground cannot be plowed more than seven inches deep without damaging the roots. If manure is applied the weeds that spring from the seeds are exceedingly hard to kill by cultivation, and smothering crops can not be used in an orchard as they can in an open field.

The one remaining method of securing the organic matter is by the use of cover crops, or what some educators call green manure crops. The fundamental idea in this is to plant something that will make a luxuriant growth of tops and roots and then work the material grown into the soil. Legumes such as crimson clover (where it will grow successfully) vetch, cowpeas, and soy beans are best when they can be grown, but some times the soil is too much r down or too rough to permit of th finer plants catching. Rye, whe turnips, millet and other such pla then are better.

Still the chief problem is not solv for attention to the top seven inch of soil that the plows will reach w not always grow a good orchard. is necessary to get the organic m ter deeper than this; down there the real feeding place of the roo Roots of the cover crop plant alo can reach this soil, and they will p do so unless the way is opened f them by deep tillage. By subsoili an orchard site with plows befo the trees are planted you can acco plish much good. A better way is do it with explosives at the time t trees are planted and every five ten years afterwards.

Too much importance cannot be a tached to this subject of filling t soil with roots down deep, where th provide organic matter for bacter to feed on, and to aid in both t storage of moisture and the liberati of insoluble plant foods. Only a fe orchardists understand the value the practice, but the experiences these few are illuminating. Clean cu tivation or intercrop practice, makes no difference if the land is cu tivated during the weeks from Apr till in July, just so the cover crop sown each year in soil that has bee given intensive tillage down dee there will be abundance of growt and overbundance of fruit.

Sorghum Grains

DR. Hunt announces that there will soon be issued by the university a circular touching upon the cultivation of the grain sorghums. This is timely and, in fact, should be in the hands of growers at this moment, for, as Dr. Hunt says, "One feature which has not been enlarged upon is the need for feed for live stock."

Sudan Grass

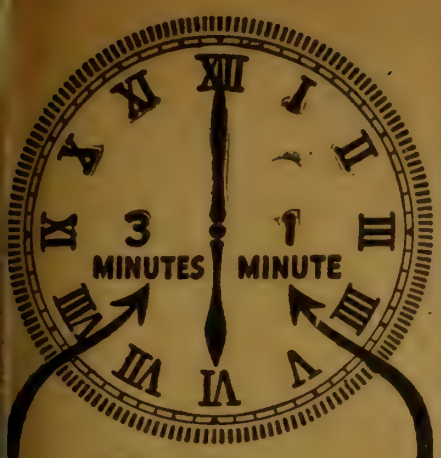
Second cutting of Sudan grass on C. D. Hayworth Ranch, Stanislaus County. Sudan is well worth considering in this year of short forage and high priced hay. This grass was brought from Sudan, Egypt, in 1909. It is closely related to the cultivated sorghums, is an annual, and resembles Johnson grass. In buying seed be sure it is pure.

The Cultivator has for some weeks been urging more extended planting of grains and forage crops. The poultryman must dispose of his stock unless he can secure cheaper feed than is possible at this time.

Milo, kafir, feterita, and Egyptian corn are perhaps the better producers. In the Imperial Valley milo is used almost exclusively. Feterita, one o the newer introduced grains, will no stand the drouth which milo will, an the heads shed badly, but it is a goo producer of exceptionally fine grain

If these grains are planted soo they may be harvested and out of th way in time for plowing for barley and other winter growing crops. Fo soiling or for pasture where th ground is now in good tilth, broadcasting is best, but if irrigation is to be followed, which is practically necessary unless conditions are exceptionally good, use drill with rows far enough apart to permit of cultivation. three and a half feet is best.

This crop is becoming such a staple one in this state that it will be well



The Curtis Form-a-Tractor

$350.00

A Tractor and Power Plant Combined

Does everything that a heavy tractor will do—at the draw bar or belt pulley—adapted to all soil and weather conditions—the most sensational farm machinery development for years.

Has the Pulling Power of 12 Autos

Your automobile engine utilized to revolve the two tractor wheels—no strain on working parts of car—auto axle merely turns pinion gears develop *twelve times the engine pulling power*—and *all the engine power for belt work.*

Cost No More than your Auto to Run

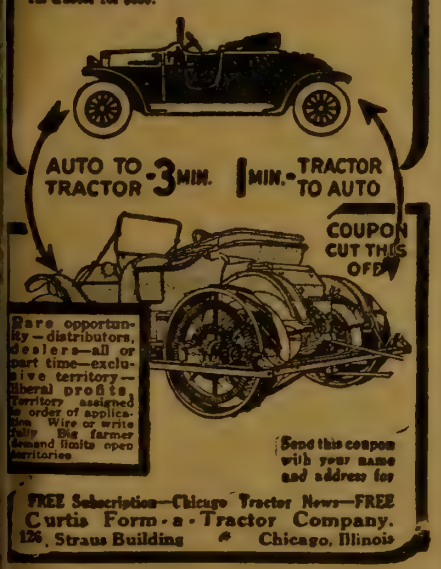
No more gasoline to run the Curtis-Form-a-Tractor than required for your auto. Starts on high and runs on high. Powerful fan prevents heating under most extreme working conditions. Guaranteed to give satisfaction in every detail—and *to outpull* any similar device of like power.

Does All Belt Work

Drive pulley for belt work included. Run the separator, saw-rig, feed grinder, ensilage cutter, or any other heavy farm machinery. Get the full engine power at the belt pulley.

FREE Subscription to Chicago Tractor News **FREE**

Get on the mailing list for the Chicago Tractor News—our free publication for those interested in power farming. Chock full of interesting tractor facts for farmers, also tells all about the Curtis-Form-a-Tractor—the wonderful tractor for $350.



Rare opportunity—distributors, dealers—all or part time—exclusive territory—liberal profits. Territory assigned in order of application. Wire or write fully. Big farmer demand limits open territories.

Will Trade for Ranch

An old established, well-paying motorcycle and bicycle business, with large repair business; holding exclusive agency for two counties. Has cleared $30,000.00 for past 6 years. Business will inventory approximately $12,000.00. Owner wishes to trade for ranch equal value or pay cash difference. For full details, write Owner, 21 Elgin Park, Apt. 5, San Francisco.

to observe the behavior of different seeds and be prepared to select that which does best under California conditions. There is a great difference, especially in kafir and feterita heads. Some are loose growing, large, bulky looking heads which may not bear more than 15 or 20 bushels per acre, while others, more compact and bearing seeds nearly to the center stalk, will yield as high as 70 to 80 bushels per acre.

These grains give almost as good returns for stock feeding as does corn. Seed required per acre, four to six pounds. Cultivation, like that of corn, should be shallow, for the roots are surface feeders.

BACTERIA ON LEGUMES

We gave the merest outline of methods of applying bacterial cultures to seeds of leguminous plants last week. More specifically: Place the seeds to be treated in a pile on the floor or, if a small quantity, place in a large pan or other container and over this pour the cultures which have been prepared according to directions accompanying the bottle. This must be used within a short time after the bottle is uncorked for it will keep but a short time. After the liquid is scattered over the seed, with the hands thoroughly mix so as to distribute the moisture to every seed if possible. Once this mixing is completed the peas, beans, or whatever the seed may be should be spread and allowed to dry in a cool shady place. Do not place in direct sunlight. In using these cultures acid condition of soil is to be corrected. The use on the soil of air-slacked lime at the rate of 1000 pounds per acre is usually beneficial. Planting or future handling of the seed is just the same as when no bacteria is used. One may also apply the bacteria to seed already planted, but the former method is the better. The cultures which succeed with alfalfa also succeed as well with beans or other legumes.

Another method, rather more difficult, however, is to take soil from a field which is known to have grown successful alfalfa or bean crops. The moist soil is used and scattered over the field which is to be planted and cultivated in before it thoroughly dries out. In following this method, however, the grower should know that the soil is free from fungous diseases.

Book Review

"MODERN PROPAGATION OF TREE FRUITS"

"Modern Propagation of Tree Fruits," by B. S. Brown, M.S., professor of horticulture, University of Maine, published by John Wiley & Sons, New York. Many Californians will recall that Prof. Brown was at one time connected with the University of California at the farm school at Davis. If we remember rightly Prof. Brown was working on this book when in this state.

Prof. Brown says in his preface:

"In preparing this little book three important factors were kept in mind. First, only to include those practices of propagation which are in general use and which are accepted by the orchardist and the commercial nurseryman as being the most important. Second to furnish in a condensed form such information on propagation as will enable the general fruit grower to follow out the practices. It is assumed that the average fruit grower has a general knowledge of the various methods of propagation, hence the many confusing details are here omitted."

There are eight chapters in the book, Chapter I touching propation, in which the importance of the nursery business, the investments in nurseries, stocks of different tree fruits, the securing of seeds, the use of cuttings, shipping of seeds, quantities used, etc., are treated. Chapter II gives information regarding the growing of seedlings, chapter III, the nursery. Other chapters discuss budding operations, grafting operations, the propagation of cuttings, after treatment of nursery stock and general considerations. In the grafting operations chapter, grafting tools, saws, chisels, shears, grafting wax, waxing pot, theories of grafting, various kinds of grafts and how to collect scions are all treated upon. The book is valuable for the nurseryman and affords a fund of information for the orchardist.

Your Wife Should Be Considered

Mr. Farm Owner:

You may have fitted up your farms and out-buildings with electric, labor-saving devices, but have you considered the ***lady of the house?***

An electrically driven washer, mangle, vacuum cleaner and other household devices will greatly lessen her work and add to her comfort.

A few words to your lighting company suggesting as a preference G-E MOTORS will repay you for the trouble.

Ice Cream Freezer

Washing Machine

Vacuum Cleaner

Don't Let Scale and Fungus Take Your Profits

UNIVERSAL BRAND ORCHARD SPRAY

Send for our new Book it's FREE

Feasible Spraying for Citrus Trees

Are you a citrus grower anxious to produce the best crops possible at the lowest cost necessary to insure quality fruit and healthy, long-lived trees?

Then there is dollar-making information for you on every page of our new book, "Spraying Citrus Trees for Control of Insect Pests and Fungus Diseases."

Exacting scientific tests of years duration on several thousand acres of orchard have conclusively proved that spraying with a COMBINED INSECTICIDE and FUNGICIDE of the proper chemicals is Feasible, Efficient, Profitable and Thoroughly Satisfactory.

Our book tells the proper kind of sprays and when to use them. Comprehensive tables show how much spray material is required per acre, no matter what formula is used.

We will send it to you free if you will send us your name, address and number of acres in grove. Write

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

One of the most beautiful animals in the world is the Jersey. She belongs in the "handsome is as handsome does" class, too. She came to American from Jersey, a little island in the English Channel, only 11 miles long. The farms there range from five to 20 acres each, and the Jersey has been bred to fit these conditions. There are only about 40,000 of them on the island, and some of the finest and best producers were brought to America as far back as 1818. Their number has been increasing in California during the past year more rapidly than at any preceding time, and a wonderful showing will be made this fall at the various live stock fairs in the state.

On the cover we show a typical face of a young Jersey of quality.

CANS

The larger canneries have arranged for their supply of cans for the coming season; the smaller ones, who have not been aware of the tin can situation, may be unable to secure sufficient for this season's pack.

The federal government is taking a strong hand in the matter of the use of tin and requests that all products which can be dried or dehydrated shall be treated in that way, and only the more perishables tinned. Where this request has been ignorad a flat order has been given to stop canning such products as beans.

Home canners may be embarrassed and compelled to pay higher prices, and glass will doubtless be used to a larger extent. Here again is opportunity for foresight and early purchasing. Presumably prices for glass are more reasonable now than they will be in the midst of the canning season.

While the canning is going on, let us dry things. Many of us doubtless recall the dried corn of olden times and the pumpkin which was thoroughly cooked and dried on platters. There are today better methods of drying these products, even string beans, turnips and other vegetables are dried. Of course in California many of these methods may be useless because of our perpetual harvest season.

The Cultivator has already in hand some hints on methods of drying and wishes more. Have our subscribers experience in this matter? Let us have a symposium on methods.

BEANS UP

The directors of the California Lima Bean Growers' Association announce the sale of 100,000 sacks of limas of the 1917 crop at nine cents, and still the price is going up. Next Thursday is the last day on which new members will be received by the association. The association does not believe in holding the sack and allowing members to drop in if they please or remain out if the please. Plans for the season's work must be completed, sacks and other supplies must be purchased.

The association recently made an additional payment on the 1916 crop of one-half- cent per pound. This means distribution of about $260,000 to producers. This will practically complete the work of the association on last year's crop.

ABOUT THE LEMON

Live stock in general, and Jerseys in particular, have appropriated the larger amount of space in this week's Cultivator. Fruit will be given more attention next week, and especially valuable will be an article on pruning and planting of lemon trees by J. P. Englehart. Mr. Englehart has grown oranges and lemons almost since their first commercial production in California and has made closest study and observation of them.

The Cultivator camera has been used to make plainer Mr. Englehart's talk, with especial reference to showing the type of budwood which he would preserve in the lemon tree. There is rank growing wood in citrus trees and a fruit growing wood, and a little observation inspired by Mr. Englehart's article will result in much more profitable citrus orchards.

LOWER INTEREST

At the meeting of the California Development Board at Stockton last week a speaker said:

"Mr. Banker, your stock is quoted at fabulous prices and is earning 20 per cent. Will you reduce our interest, extend us more credits, and get us cheaper machinery if we should jeopardize our life's work that we may produce more food products for our army and navy that protect your securities?"

The same speaker offered to give freely of his services to aid in securing greater production.

But the farmer needs more and better equipment. Let capital see that he gets it.

THE DAVIS PICNIC

Things moved at the university farm picnic last Saturday. The wind started it and human dynamos picked up the movement and gave more punch to it and the agricultural preparedness campaign was pushed on. Thousands came though the great crowd of last year was not equaled.

There were games, inspection of farm operations, parades, valuable discussion and demonstrations, all of which means more tonnage of food products for California.

Mr. Meek said we need more production and for more production more farm power, more labor.

"It is true that it is impossible to starve the American people. We can produce practically everything we need, in sufficient quantities to care for our wants, but we have entered the greatest war history ever has known. It is a fight to the finish between autocracy and democracy.

"There is a great farm labor shortage facing us. We need a hundred thousand more men than are now in sight to harvest our crops. There are thousands of men engaged in the city in unproductive occupations, such as delivery men, solicitors and jitney drivers who could be used to help solve this problem."

As to California's supply of available food Prof. D. N. Morgan, who has had charge of the survey, said. California per capita supply: "Beans, 13 pounds; flour, 80 pounds; dried fruit, 20 pounds; meat, 2 pounds; sugar, 20 pounds; rice, 3 pounds; fish, 1 pound (the daily catch of fish is 180,000 pounds)."

Professor Morgan said there is sufficient food in California for home needs and a little for export, but that this state should produce much more for export.

Dean Hunt and Prof. Van Norman with large force of helpers made it a most memorable day for every attendant.

EFFICIENCY

This is a year for most efficient service. While there is much hot air wasted in the cities in the "produce more" campaign, there is also a genuine effort to meet the needs of the world. As to the shortage of food there is no question, and that the shortage will become more acute is equally certain, for there are thousands of tons weekly going to the bottom of the Atlantic.

There is one advantage which will come from the present agitation, and that is increase in efficiency of our farmers. This is made necessary, not only by the demand for more foodstuffs, but by the decreased supply of labor. And the labor question, by the way, is a long one. Hence, better equipment.

Here's a hint for the grower who may be in reach of establishments of Cultivator advertisers. With a list of these advertisers in the pocket one can spend a profitable day looking through implement houses. It costs money to equip, but it costs money to hire labor which perfect equipment may make unnecessary, or at least may lessen demand for. Money paid for labor is gone. Money paid for implements remains for future service.

The gas engine, or motor, has perhaps done more than any other one force to make effective the work on the farm. But as to implements; the manure spreader, the power sprayer, the adjustable cultivators, on which genius has worked out the most effective combinations, the gang plow, the drill, the seeder and the planter, all have added to the ability to do. We recently saw a hay press with self feed. This is not only a case of efficiency, of saving an extra man, but a case of safety first, for there can be no more crushed limbs. Then there is a pea and bean threshing machine mounted on one end of a truck with a small gas engine on the other, only a small neighborhood affair, but assuring saving of the beans instead of waiting for the big thresher outfit which may get around long after the rains have begun. The big combined harvester drawn by 25 or 45 horses formerly or by the big 75's of the past few years, is familiar to all who have seen California grain growing conditions. Now comes the small combined machine operated by one man and with either four or six horses. It costs about $1250; it weighs 2600 pounds and has an eight-foot cut, but it is a labor saver. Then there are light power disk plows with power lift for two to five gangs. These do exceptionally well in the turning under of cover crops in the large orchards. Then there is the one-man planter, operated by horse and man. This will plant almost everything, from kafir and milo to the larger beans.

We need not enumerate more of these appliances, for this is only to call attention of the producers to some of these up-to-date, efficient means of doing things.

Here again is where an early order may secure delivery in time for use in season. Manufacturing plants and transportation companies are all busy in many directions. Get your order in early.

When You Buy Home Furnishings from Barker Bros. in Los Angeles You Are Assured QUALITY Goods and Not "Mail Order" Merchandise.

Many concerns catering to mail order customers carry what is known to the trade as "mail order goods"—a grade made and designed to meet keen competition and afford highest possible margin of profit at the same time.

With Barker Bros. it is different. Merchandise intended for any kind of sale other than by regular selection on the floors of this store are never selected by Barker Bros. no matter how alluring the wholesale price or how great the possible profit from their sale. Every article distinguished by a place in our stock must first pass rigid inspection and possess the basic element of QUALITY which for nearly forty years has been associated with the offerings of this house.

The same high grade goods afforded Los Angeles people are open to the out-of-town buyer with every assurance of satisfaction as though selected in our store in person.

If you cannot visit our store, you will find it distinctly advantageous to buy through our MAIL ORDER DEPARTMENT. You are urged to write, telling us just what you want, etc. We will respond quickly, intelligently and courteously. We can save you money on furniture and everything in home furnishings.

Write for our 48-page catalogue of Draperies, Floor Coverings, etc., just off the press.

WE PREPAY ALL TRANSPORTATION CHARGES to any railroad, express or parcel post point in the United States, within two hundred and fifty (250) miles of Los Angeles and make liberal allowance for transportation charges beyond 250 miles, anywhere in the world.

Agricultural News Notes of the Pacific Coast

Northern California

The Farmers' Protective League is after cattle rustlers.

Sutter County's biggest bean patch contains 1500 acres.

A new irrigation district is to be formed at Fairoaks, Sacramento County.

Ten thousand acres of land never before in rice will be planted in District 108, Northern Yolo County.

The increase in rice prices has caused a materially larger planting in Butte, Yolo and Glenn Counties.

The Sutter Almond Growers' Association met recently at Yuba City and elected directors for the coming year.

Shasta County prune growers are organizing and becoming members of the Prune and Apricot Growers' Association.

Thompson Seedless grapes in Sutter County were very seriously injured by the heavy frost about the middle of April.

Today is picnic day at the university farm, Davis, and the day has been declared a picnic holiday by all institutions of Yolo County.

The sugar beet outlook is exceptionally fine in Glenn County. A spur of the Southern Pacfic has been built into new beet growing sections.

J. B. Wrangham, secretary of the California Almond Growers' Exchange died recently at Oakland. The loss is a serious one for the Exchange.

The Tehama County Farm Loan Association is making initial appraisements of property as a first step toward securing loans from the federal loan bureau.

President G. W. Pierce, of the Almond Growers' Associaion, is visiting various almond producing sections in the interest of more effective organization for this season's work.

A sale of 2500 sacks of rice was made last week to a San Francisco firm by the Moulton Irrigated Lands Company for $2.68¾ per sack. Several bids have been made at $2.40.

Supervisors of Nevada County have been requested by a large number of farmers and business men to appropriate funds sufficient to secure the appointment of a farm adviser.

Butte County has been contemplating the appointment of a farm adviser, but definite action has been postponed pending more enthusiastic action on the part of the farmers.

The Amador-Eldorado Live Stock Association, a live wire in the matter of advancing and protecting the interests of its members, recently held a largely attended meeting at Placerville.

The state fish and game commission is planning a method of saving fish which are caught by receding waters in the tule basins of Sutter and Yuba Counties. Professional seiners will be employed.

Cloverdale, Sonoma County, has enacted an ordinance which will fine owners of dogs five dollars if they are allowed at large on the streets. Cows going to or from pasture must be led by an attendant.

The forest service has an office in San Francisco in which it requests campers or travelers in national forests or reservations to file recommendations as to any possible method of bettering the forest service.

Central California

Stockton is to have a free municipal market.

Feed ranges in the Sierra Nevada are reported in bad condition.

Cut worms have done some damage to Malaga grapes in Tulare County.

Stanislaus County growers are discussing conservation of animal feed.

The state dairy cow competition is now in full swing with all entries closed.

"More beef, more hogs" is urged in the report of the state council for defense.

San Joaquin County reports its grain crop as 75 per cent better than last year.

One bean grower of San Joaquin County netted $6500 for 8000 bags of pink beans.

Two hundred acres will be put in Tepary beans by Jesse Loughead of Poplar, Tulare County.

Fresno reports demand for dried fruit for future delivery as far better than other years this date.

The Tulare Cooperative Poultry Association made sales during March amounting to over $17,000.

The Lindsay Olive Growers' Association has elected W. B. Kiggens, president; R. W. Fenn, secretary; J. W. Irwin, treasurer.

Buyers are reported going through the country gathering up old horses and cows to be shipped to Petaluma for poultry feed.

A few days ago the wheat growers were paying $3.50 per cental; presumably before these words are read this price may be materially increased.

A Delta farmer of San Joaquin County has suggested to the state council of defense that many of the pastures of the "Islands" of San Joaquin County could most profitably be turned into grain fields.

San Jose reports that the Prune and Apricot Growers' Association has now practically 75 per cent of the California output signed up. Manager Coykendall says; "We have the acreage and we will now proceed to effect the organization.

A survey of the Turlock irrigation district shows a total planting of 116,319 acres. The leader of all the crops is alfalfa, with 42,418 acres. About 12,000 other acres are in crops, such as hay, which will soon be taken from the land and other crops put in.

The Deer Creek Citrus Association of Tulare County has filed articles of incorporation. The following directors have been named: Frank Wheeler, Albert Behrens, George E. Small, Philip A. Schultz, E. R. E. Paetsch, Will F. Phillips and Fred H. Gerdes.

E. B. Merritt, sales manager, and H. Thomas, advertising manager, of the raisin association, and J. F. Niswander, manager of the Peach Growers' Association, left Fresno April 23 for a seven-weeks' tour of the United States and Canada, visiting selling agents of their organization, brokers and specialty men.

The recent annual meeting of the Lindsay Olive Growers' Association resulted in the election of the following directors: W. B. Kiggens, W. A. Bohland, A. N. Moss, J. W. Irwin, E. E. Cross, S. W. Etheredge, R. W. Fenn; president, W. B. Kiggens; vice president, W. A. Bohland; secretary, R. W. Fenn; treasurer, J. W. Irwin.

Southern California

San Bernardino County is working for a farm adviser.

Effort is being made to organize a farm bureau center at Redlands.

Walnuts in nearly all sections of Southern California are setting full.

A carload of Imperial Valley fat lambs were recently shipped to Denver.

Hemet apricot growers are being offered $50 per green ton for their fruit.

School boys of Los Angeles high schools are weeding and thinning in the beet fields.

The bean acreage of Orange County this year is estimated at between 50,000 and 60,000.

The Hemet cannery is being materially improved and made ready for the coming season's pack.

Riverside County is the latest with a farm adviser, W. B. Parker beginning his term in that county May 1.

May 10 is the last day on which lima bean growers may sign up with the Lima Bean Growers' Association.

D. C. Lefferts has started suit against a fumigation company for $10,000 damages to his orange grove.

The annual meeting of the stockholders of the Santa Paula Walnut Association will be held next Tuesday.

The state legislature refused to make an appropriation in connection with the experiment station school at Riverside.

Cherries were seriously injured by April frosts in the Oak Glen, San Bernardino County, section. Apples, however, escaped.

The irrigation bond petition for an issue of $2,500,000 for improvement in the Imperial Valley canal system has received sufficient signatures, and the election will soon be held.

The cantaloupe season in the Imperial Valley will be late, but satisfactory warm weather has been given since March 25 so that vines are now making good growth and melons setting.

Thermal reports onion crates arriving at the rate of four car loads daily and being hauled by auto trucks to the ranches. There is the largest crop of onions ever grown in Coachella Valley.

Some of the ranchers of the Wintersburg section of Orange County are considering advisability of plowing under beets and planting beans, because of the attractiveness of bean prices and scarcity of labor for beet thinning.

At the recent monthly meeting of the California Lima Bean Growers' Association it was announced that the association has sold 100,000 sacks of beans of the 1917 crop for an average price of nine cents a pound. The price is still going up.

A simple steam sterilizer is being demonstrated by Health Officer Rice of Pomona. It is for the use of owners of three or four cows who wish to sell milk for human consumption. This is a government model which can be cheaply duplicated.

An increase of ten per cent in wages has been offered by the San Dimas Lemon Association to all packing house workers. This is to be paid as a bonus at the end of the season in October to those who stay with the house till that time. Pickers were raised 25 cents an hour.

The Coast

A farm loan association has been organized in Gila County, Arizona.

Farmers of Whatcom County, Washington, are selling hay at $40 per ton.

Farmers of Marion County, Oregon, have agreed to plant 500 acres of beans this season.

Considerable loss has visited the farmers of Cochise County, Arizona, because of loco poisoning.

Idaho stock raisers have been compelled to buy hay from Chicago, 25 cars coming in one bunch.

Women students of the Oregon Agricultural College have organized a Woman's Agricultural Association.

The Oregon Cattle and Horse Raisers' Association held its annual meeting at La Grande, Oregon, last week.

Hubbard, Oregon, is the center of onion set production, and the entire output has been cleaned up for this season.

Hundreds of acres of rich lands of Arizona not planted before have been brought under irrigation and are growing grain.

The live stock industry of Crook County, Oregon, has increased more than 50 per cent during the past five years.

The Wyoming Stock Growers' Association now has 1200 members. It recently held an enthusiastic meeting at Cheyenne.

Pupils from Tucson have recently visited the orchards of Salt River Valley for the purpose of studying sub-tropical fruits.

A dairyman at Grants Pass, Oregon, recently installed a number of purebred Jerseys, three of the best of these costing $1800.

The fourth annual meeting of the Oregon Cattle and Horse Raisers' Association was held at LaGrande Tuesday and Wednesday of this week.

At a meeting of the Fruit Growers' Agency at Spokane, Washington, J. B. Adams of Walla Walla was elected president and L. J. Blot, of Spokane, secretary.

The Mormon church at Salt Lake City, Utah, is offering a prize of $1000 for the best acre of potatoes produced; also $1000 for the best five acres of spring wheat.

One large concern has assured the Chandler Egyptian Cotton Growers' Association that its institution is in the field to purchase 100,000 bales of Arizona Egyptian cotton.

A bill providing for a new state department of markets for the state of Washington has passed the legislature. Fifteen thousand dollars is set aside for the operation of the department the first year. The department is to be attached to the state college.

The Utah-Idaho Sugar Company, with factories in both those states, offers list of premiums totaling nearly $4000 for the farmers who deliver the largest number of acres of sugar beets, the largest tonnage of sugar beets, the best average tonnage per acre, for each one of its 14 factories.

Stockmen of Okanogan County, Washington, recently met and discussed the losses to their stock from rabies which has been prevalent. Department of Agriculture Expert Averill said that unless a strong hand was taken with this trouble the losses to live stock would run into the millions.

Heap big mileage!

Built-In!

If you could dissect a SAVAGE you'd realize that "Heap big mileage" is built into it during every minute of its manufacture.

Highest grade rubber and fabric, perfectly balanced design, most careful workmanship, full size.

A tough road-gripping tread—neither so heavy as to produce stiffness, nor so light as to give insufficient protection to the carcass. Cushion of high-grade resilient rubber—absorbs the road shocks. Sidewall specially shaped to distribute flexing—will not crack.

And the carcass—finest Sea Island cotton, long fibre, tough, triple tested, built up layer by layer into the strongest carcass that can be made.

High mileage, low cost per mile. Sold from factory to you through our own distributors. Watch for the red Savage sign.

Legal Queries

Louis B. Stanton, attorney, 243 Willcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Unsigned communications receive no attention.

Broken Pipe

If owner employs a man to cultivate his place and cultivator breaks a pipe which is laid six inches under the ground, cultivator not having been told of the pipe, who is responsible? According to law what depth should a pipe be laid?—Subscriber.

If the man has not been told to look out for pipes and he knows nothing of the pipes being located under the ground he is cultivating, it would appear that the property owner is the one who should bear the loss.

Note Lost

A gives a note secured by a mortgage on land, to run three years. A renews note for two years. At end of six months paid interest. Some weeks after that B claims note is lost or stolen and claims note was drawn for one year. Note is not on record.—Subscriber.

It is purely and simply a matter of proof and as to which side the court will believe on the question of the length of time for which the renewal was made. It would seem that the best thing for you to do is to refinance your mortgage with some other party, thus paying off your old note. On foreclosure of a mortgage you are, of course, entitled to a year within which to redeem. The additional expense incident to the foreclosure probably would not amount to over $100, so that by exercise of reasonable diligence you should be able to save your place one way or the other.

Roads on Section Lines

Is there any legal reservation on section lines for road purposes? If so, how many feet are reserved on each side of section line?—Subscriber.

The code provides that the width of all public highways shall be not less than 40 feet. It is, of course, frequently found that roads follow the section lines on account of convenience due to the manner in which government lands were taken up, but there is no law of which the writer has knowledge, that reserves a road along the section lines in this state.

Draining Land

I own property with a storm water creek running through it, in which water sometimes runs for a few days during the rainy season. I would like to know whether I can lay a few strings of underground tile and drain alkali into the water-way without forming a drainage district or getting permission from property owners below me? Would also like to know whether I can drain into the road gutter of the county road providing it is deep enough to give me an outlet for my tile. It would only have to follow the road gutter a few rods before reaching the creek and a culvert.—Subscriber.

The owner of land has the right to collect surface water and the natural drainage of his land into ditches, drains, or artificial streams and discharge it into a natural watercourse on his land, which is the natural outlet of the waters so collected, and is not liable to lower proprietors even though the flow of the waters is accelerated or increased; provided the discharge is not beyond the natural capacity of the watercourse. The word "watercourse" in this connection also includes ravine, gulley, or natural depression, having a fixed course, and which follows a natural channel for the escape of surface waters. It would seem that you could also discharge, as stated in the question, into the road gutter provided, however, that no injury to the highway results therefrom. If injury does so result you are liable to a penalty of $10 for each day during which the injury remains and may also be prosecuted under the provisions of the penal code.

Unsigned communications receive no attention.

Shoulder Slip or Sweeny

I have a horse that is apparently sound when standing for a time but gets lame when he starts out and after going a mile or so gets lamer and lamer, until he cannot touch his foot to the ground. This lameness started about a year ago and is getting worse constantly. There is a slight lump on the shoulder and we are sure it is not a sweeny. We were riding him one day when he stumbled and was a little lame after it but seemed all right next day. Please tell me what I can do for him.—Subscriber, Coachella.

The tendon that passes over the shoulder joint was strained at the time the horse stumbled. Now, after so long standing it will be hard to cure. It may need to be fired and blistered and the blister repeated several times. You really need a veterinarian to do it for you.

Difficult Parturition

I have a four-year-old mare that labored a good part of the night delivering a colt. In the morning the colt was dead with nose and front feet in sight. We had to take it. The mare did not try to get up for two or three hours, and then could not stand and was not able to stand for two days, being paarlyzed in the right hind leg. Now after ten days she walks with a hitch and seems to take a trifle longer step with the right leg. Is there anything that I can do to help her and was there anything I could have done to have prevented it?—Subscriber, Owensmouth.

The mare should have had assistance and the whole trouble probably would have been averted. If a mare does not foal in 20 minutes there is something wrong and she should have help. She will probably recover all right in time but you can hurry it along by applying a good liniment on the top of the hips at the highest point: that is where the muscles and nerves are affected from the straining. Try this liniment: One ounce each turpentine, tincture of camphor, tincture of capsicum, oil of origanum and aqua ammonia; four ounces of alcohol and enough water to make one pint. Mix. Apply twice a day and rub it in well.

Queries

Too Late for Alfalfa

Is the middle of May too late for planting alfalfa in this part of the country (Mohave)? We can expect very little rain, if any, from now on, yet I am in a position to irrigate it. Should it be irrigated before it comes up or should I keep the water off until after it comes up? What would be the best cover crop to sow with it, oats or barley?—Subscriber, Mohave.

It is too late in the year to get a good stand from alfalfa seed sowed at this time in your locality. Alfalfa should be sowed in the cooler weather while the evaporation of water from the surface soil is at the minimum. Then have the soil thoroughly wet, sow the seed and harrow well with a drag harrow and follow with a roller. This is of course wasteful of moisture, but there must be moisture in the ground sufficient to keep a supply near the surface until the young plants have become established. It is not best to irrigate until the young plants have four to six inches growth, but it sometimes becomes necessary to put water on earlier to save the plants. In that case a very small stream of water should be used to avoid washing.

Better results will be obtained this year by planting to some one of the grain sorghums, preferably Dwarf Milo maize. Have the land well prepared and plant in rows three feet six inches to three feet ten inches apart, with the grain eight to ten inches apart in the row, but do not allow more than one plant in a place as this grain stools considerably and will be too thick to produce a crop of grain. If the seed is planted properly three to four pounds will be sufficient for an acre. The seed should be planted deep enough to be in the moist ground, but will not come up if deeper than four inches. Frequent cultivation should be given and the crop will be very much increased by liberal irrigation.—J. B. N.

Gopher Bounty

Please give information as to the bounty on gopher tails.—Subscriber, Burbank.

We believe there are no counties in this state which give bounty on gophers. Certainly Los Angeles County does not.

DUNHAM CULTI-PACKER

TRADE MARK REG.

Culti-Pack Growing Crops

Not only your corn, but your wheat, oats and similar crops can be kept in prime growing condition by going over the growing plants with the Culti-Packer.

This tool firms the soil about the roots, breaks up crusts or lumps, and *stirs* the surface like a cultivator. Farmers use it on wheat or oats or corn till several inches high with absolutely no damage and wheels can be quickly detached for straddling larger corn.

See the Culti-Packer at your John Deere dealer.

Quick detachable wheels removed from Culti-Packer for cultivating corn until it is a foot high.

FREE

"SOIL SENSE"

48 pages—100 field photographs on soils, seed beds, cultivation, etc.

Ask your dealer for it—or write direct.

THE DUNHAM CO., 308-336 FIRST ST., BEREA, OHIO

Why Europe Makes Bigger Crops Than the United States

Average Production of European Crops is as Follows:		Average Production of American Crops is as Follows:	
Wheat	33 bushels per acre	Wheat	14 bushels per acre
Oats	45 " "	Oats	40 " "
Potatoes	199.84 " "	Potatoes	97.15 " "
Cotton in Egypt	400 pounds "	Cotton	185 pounds "

European farmers use about 600 pounds to the acre of a Home-Mixed Nitrated Fertilizer containing 8 per cent of Phosphoric Acid and 4½ per cent of Nitrated or Nitratable Nitrogen.

American farmers apply 200 pounds to the acre of a Fertilizer containing 8 per cent of Phosphoric Acid, together with 2 per cent of Nitrogen which is mostly unavailable.

The difference in results is largely due to the large amount of Nitrated Nitrogen used in Europe per acre as **Nitrate of Soda.** Our pitifully small American yields are due to failure to appreciate the necessity of using Nitrated Nitrogen.

Write for "What Nitrate Has Done in the Farmer's Own Hands"

Vegetable Planting Calendar for May

Northern California

Written for California Cultivator By A. R. Gould

IN view of the movement which is general throughout the country to grow more food and see to it that the land is made to produce an abundant supply, readers of the Cultivator will be well able to assist and apply the information which has already been given to good advantage. And let me urge you to lose no time nor space in an endeavor to produce the crops. It is not too late to bring still more land into use and perhaps you have half an acre or more which you could prepare and use. Such crops as beans and tomatoes may be planted and will grow with very little water, and it may also be convenient to use an overhead sprinkler to irrigate in some way or other, in which case onions and corn may be grown. These crops are all of great value.

Peas

The early varieties will soon be ready to pick now, and those of the main crop which grow tall may require staking by this time. Wire and sticks every ten feet should be used. Where there is a good water supply available keep well watered and this will also keep down the aphis. Readers well favored with water may also make another sowing of Melting Sugar variety and Little Marvel.

Onions

Many of the seedlings thinned out from the regular rows may be used to plant up new beds. Trenches may be made and these seedlings laid in ten to 12 inches apart. If irrigation and constant cultivation can be resorted to they should supply fine bulbs by the fall, which if stored in a dry place can be kept all winter and will prove of value to the housewife. Ailsa Craig, Prizetaker and Australian Brown are the best keeping onions and are varieties which we recommended in January last for planting. By this time there should be lots of seedlings of these to spare, and in view of the present food crisis not a single plant should be wasted but use every one available and all spare ground.

Carrots

This is another useful vegetable which can be served up in many different ways and will also keep quite a long time after growth is finished. Sow in quantity, not too thickly, French Forcing and Danvers Half Long. If possible give these plenty of water.

Corn

Sow Country Gentleman, Golden Bantam and Late Mammoth varieties about 18 inches apart in rows 36 inches apart. One and a half pounds of seed will be needed to sow a 100-foot row. As soon as the plants are up three inches keep the cultivator going through the rows.

Turnips

Sow more of these varieties which quickly mature, such as Early Snowball and Orange Jelly, and for late keeping sow the rutabaga, or Swedish turnip, Large White or American Purple Top. These grow to a very large size and are not generally used in this country for table but are esteemed in Europe for their food value and long keeping qualities and are certainly worth growing to help out the food shortage. Sow these by the acre as they will also be useful to store away for the winter. We shall give a few hints or methods of storage in a month or two.

Beets

You may still make sowings of Crosby's Egyptian and Detroit Dark Red. Give them a fair amount of water.

Lettuce

Sow White Paris Cos and Big Boston. Keep the cultivator, or hoe at work between the rows.

Tomatoes

These should be planted out this month; San Jose Canner, Victoria Whole Salad and the varieties as mentioned before. After planting supply plenty of water for a week or two to get them started, after which they should be simply mulched around the roots with a dust mulch and they will then grow without much further attention. Space the plants at least six feet apart either way. As the plants develop look out for black aphis which can be destroyed by the application of "Black Leaf 40" or Aphine. Large areas of tomatoes should be planted up as they grow without much water and they can be carred for the winter months.

Peppers

Plant out these in rows 20 inches apart some time this month.

Squash, Pumpkins, Etc.

Small mounds well manured may be made up for these six or eight feet apart either way, and three or four seeds may be sown to a mound and watered for a time. Eventually thin out to one or two plants. These will also be useful to put in storage for winter use. Plant the Hubbard, Boston Marrow, Early White Bush Scallop, Vegetable Marrow and Morse's Marrow.

Cucumbers

See that these are sown without delay in mounds as advised for squash. White Spine is a splendid variety as is also Long Green.

Melons

Make up mounds as advised for squash and plant three seeds to a mound: Rocky Ford, Persian, Golden Beauty, Casaba and Burrell's Gem. Also such watermelons as Angeleno and Black Seeded Chilian. Supply these with plenty of water during the first few months.

Artichokes-Asparagus

Artichokes (Globe). These will now require plenty of water as also will the asparagus beds.

Potatoes

There is still time to plant a late crop, such as American Wonder or Oregon Burbank, and those who are anxious to fill their gardens up with something substantial should secure sound seed tubers at once and get busy. Those planted earlier will now need hoeing, and the soil should be carefully drawn around the roots.

Beans

Sow more and more of these at once: Golden Wax, Refugee, Stringless Green Pod and the White Tepary (for dry situations). Cultivate between the rows as they show through and continue to do so.

Celery

See that trenches well manured are prepared for this crop, and the young plants should be ready in a few weeks to set out.

Southern California

Written for California Cultivator By D. F. Reichard

ON a ranch it is too often considered a waste of space and time to grow vegetables for home consumption. This may be true in some instances, but in general the vegetable garden is a very profitable part of the ranch, especially so if one is inclined to give it proper care. One has right at hand, as needed, herbs and other vegetables that one particularly likes, but are not always obtainable on the market.

Now that the dictum has gone out for us all to produce as much as is possible to make up for the great shortage of foodstuffs it is imperative that we put all unoccupied ground into some crop. A vegetable garden for home use should be the first consideration.

There is also a social side to this work. Neighbors are always interested in what each other are doing, and a well kept garden is always attractive. Visitors, especially those from the city, take it as a matter of course that your fruit or berries or peppers or whatever you are specializing in are doing well, but as soon as they get sight of the garden patch they are at once interested and will spend hours

going through it with you, and both of you will find new things to talk about and are better for it.

A few suggestions on the home garden, which is much more diversified than the market garden, may be of use now, although the garden should have been under way several months ago.

The plot should be large enough to produce an ample supply for the family, from 50 x 50 to 200 feet square according to number of persons to be supplied. The ground selected for the garden should be of rich loam soil, easy to work, and be nearly level or with the slope, preferably to the south, of from two to four feet to the 100 feet, so that when irrigating the water will go down the furrows slowly and soak into the ground instead of rushing over the surface and out into the road or elsewhere where it is not needed.

After the ground is decided on then the plan of successive crops should be worked out. It is well to make out a chart for reference when the planning is done. A complete rotation of crops will maintain the richness of the soil and will be a saving in fertilizer, although a certain amount of either commercial or animal fertilizer must be put in each year to keep up fertility.

For the home garden it is always better to have water under pressure so that irrigation can be regulated from hydrants which should be not over 50 feet apart, as it is much cheaper to put in pipe and faucets than to buy hose. Pipe once laid will last a lifetime while hose wears out every few years and has a greater first cost. If you are situated so that your water is not under pressure, then ditch or flume systems will necessarily have to be relied on. By using the flume system you will save at least 25 per cent of the water as well as avoid the washing away of your soil which occurs with the open ditch system. Equip with one-inch to two-inch outlets about two feet apart, having either cork or tin gates. Underground concrete pipe systems are even better than the flume, turnouts being placed at intervals of about 20 feet. When irrigating allow the water to run very slowly down the rows, taking at least an hour to travel 100 feet. This gives the water a chance to soak into the ground and you will not have to irrigate one-third as often as where the water is rushed over the ground.

What is as important as irrigation is cultivation. The handling of the soil after it has been wet either by rains or irrigation cannot be impressed too strongly. As soon as the ground breaks up well without sticking to the cultivator or spade it is in proper condition to work. The whole surface should be gone over with the proper tools until the clods are all broken up. About a home garden one needs a light hoe, rake, shovel, spading fork, Norcross cultivator, five tined manure hook and a hand cultivator, such as Iron Age or Planet Jr., equipped with a plow, cultivator teeth, weed cutters and rakes, and if the garden is large a seeder is practical.

During the month of May our work will be heavier than ordinary. Irrigating will be necessary for practically all growing plants, and that means cultivation and the liberal use of the hoe to get the weeds out of the way. Watch the growing trees to see that they are not developing ill shaped heads. It is well to discontinue the cutting of asparagus this month, especially if the plants are young. Let the shoots grow up to mature plants that the roots may be developing. See that your tomatoes are not getting too wet and that the ground is well worked and pulverized.

The seeds of all varieties of vegetable may be sown this month with success with the exception of peas, turnips, cauliflower and cabbage, except in cool places.

NEXT WEEK

This Month in the ornamental garden, both for Northern and for Southern California, will appear in the next issue of the Cultivator.

Always live within your income,
For there's just this much about it—
If you do not live within it
You will some day live without it.
—Exchange.

FARMERS RUN RAILROAD

There is one railroad in the United States without a single debt and that is run by a bunch of farmers, says the Spokane Chronicle. C. A. Granis is president and George P. Wiley is secretary. They probably aren't known on Wall Street, but in the Big Bend country of Washington they are regular rail magnates.

The line is eight miles long. It was concerning this road that the old railroad story was told—it isn't as long as the Great Northern but is just as wide. The road runs from Waterville to Douglas and meets all of the Great Northern trains at Douglas. The company was organized in 1909 and has been paying 4 per cent regularly on its capitalization of $80,000.

The Delano-McFarland National Farm Loan Association has a membership of 26 who desire to borrow in the aggregate about $70,000. This association is the result of farm bureau activities. All told it is anticipated that Kern County will wish to borrow $600,000 or $700,000 of the federal farm loan board.

These Redwood frame dwellings, at 20th and Mission Streets, were scorched, but refused to burn, thus preventing a further spread of the big San Francisco conflagration of 1906. The telephone poles are also Redwood.

The safest wood you can use

Uncle Sam says, in the United States Forest Service Circular No. 193:

"Redwood resists fire well, and even when ignited burns very slowly. It checks but little when exposed to the sun, and is practically free from resin. These properties make it especially suitable for use in buildings."

Chief Engineer P. H. Shaughnessy of the San Francisco Fire Dept., after 22 years' experience with Redwood, including the big fire of 1906, said:

"ignites much less quickly"—"burns much more slowly"—"more easily extinguished."

Sounds like the kind of wood you should use for the new home, doesn't it? Especially when you add that it *resists rot, will not shrink or warp,* is light in weight, easily worked and suitable for every inside and outside use except fine floors.

California Redwood

Resists fire and rot

Ask for "A Test by Fire" and "California Redwood on the Farm." They're free. We will appreciate receiving the names of your architect, builder and local retail lumber dealer.

CALIFORNIA REDWOOD ASSOCIATION
770 New Call Building, San Francisco

Ask for the Child's Story of the "Big Trees" of California—there's a copy for every child in the nation

Gives any speed you want-instantly

CEDAR RAPIDS SPEED GOVERNOR

—as low as $12.00

Includes line shaft, pulleys and hangers, attached to heavy plank

—the speed governor of a thousand different speeds. Every turn of the hand wheel gives a different speed and each speed is absolutely steady and uniform.

Install it yourself with a screw driver. No figuring pulleys, no chance of installing it wrong for it runs in either direction, attached to the floor, the wall or the ceiling. It's *as cheap as an ordinary line-shaft* with the governor pulley thrown in.

THE Cedar Rapids Speed Governing Line Shaft is as cheap as the average friction-clutch pulley, yet it controls the speed of several pulleys at once without stopping your engine. The engine operates the governor—the governor controls the line-shaft.

The governor absorbs all jerky vibration. The power transmitted is steady and smooth. Runs all machinery at uniform speed. If you own an engine you need the Cedar Rapids Speed Governing Line-Shaft. One man saved enough labor fanning 50 bushels of clover-seed to more than pay for his governor outfit.

Go To Your Dealer and see it. He'll demonstrate it and he'll show you what a profit-producer it will be for you. Get ALL THE FACTS. THEY ARE WORTH KNOWING.

CEDAR RAPIDS FOUNDRY & MACHINE COMPANY
752 Second Street, West
Cedar Rapids - - Iowa

Controls Them All

Cream separators require starting at slow speed. The Speed Governing Line Shaft *makes any separator run smoothly.*

Butter Churning necessitates slowing down the machinery to gather the butter. It regulates this.

Your Grindstone can best be run from a pulley on the Speed Governing Line Shaft.

Lighting plants require regular power without "miss-fire" or "break." Controlled by the Speed Governing Line Shaft.

Your Washing Machine should be operated slowly when washing large pieces. The Governing Line Shaft controls it.

$50 in Cash Prizes

to be awarded July 1st. Present *owners* and *prospective buyers* should write for full particulars.

THE JERSEY ENLISTMENT

Continued from Page 507

This young bull carries the blood of the most prominent of Jersey families. He comes from the Ferndale Farm near St. Joseph, Missouri.

The value of Register of Merit testing has been brought home to the breeder on so many occasions that this work has taken a very strong foothold. The prospective purchasers are insisting more and more that the offspring be from a Register of Merit dam. One prominent Jersey breeder remarked just recently that bulls from authentically tested dams are seldom found waiting for a home. This little saying, coming from this man, might well be kept in mind by some of our breeders who are still on the fence.

In the California State Dairy Cow Competition we again find the Jersey in a prominent position. Fern's Silver Ray and Interested Jap's Santa, owned by Mr. F. H. Van Derpoel, of El Centro, and the University of California, at Davis, respectively, are leading the Jersey division with an average of 80 pounds of butterfat per month. Both are being milked and fed under strictly dairy conditions, twice a day.

We need not fear for the Jersey cow in California. The conditions in this state, both climatic and feed conditions, are ideal for the Jersey. On practically her own merits she has made a phenomenal rise to popularity.

Jerseys are today the most talked of and sought for of all the dairy breeds, not only in California, but far and wide over the United States. The Jersey is now appealing more than ever to the business and practical man's point of view.

Eminent's Bess 209719

Worlds champion Jersey cow. Owned by Roycroft Farms, Michigan, 18,782 lbs. 15.6 oz. milk, 962 lbs., 13.6 oz. fat, 1132 lbs., 12 oz. butter one year. World's record for both Jersey and Guernsey breeds.

JERSEYS FOR PRESENT DAY REQUIREMENTS

Written for California Cultivator
By C. L. Hughes

THE watchword today in all of dairydom is known production. The owner of grade and common dairy cows must know the production of each individual cow in his herd throughout a year and then year after year, in order to weed out the boarders, and keep only the profit makers. To this weeding process the agricultural press, the agricultural colleges, and all other agricultural educational agents have lent their support through published facts, practical demonstrations, cow testing associations, and dairy competitions.

After a dairyman knows the production of his herd as established by private tests or by cow testing association records, his next progressive step is to breed better cows than the best he has retained in his herd, and the laws of animal breeding say that he can do this only by using a pure bred sire that will transmit higher production of milk and butterfat. It is at this point that the dairyman must turn to the breeder of pure bred registered dairy cattle for the instrument to further his progress. The breeder of pure bred dairy cattle is enabled to know the production of each individual cow in his herd and to make this production a matter of reliable official public record through the official tests conducted by the various national breed associations and entered by them in their official advanced registers.

In times past, and in possibly a lesser degree today, all breeds of registered dairy cattle have suffered greatly through the fact that some of the greatest cow specimens have lived and died in the hands of some breeder who never took the pains to make an official record of their production. In countless numbers the sons of such great cows have gone to the butcher's block, the quality of their blood unknown, while the absence of the selection established by official testing has also been responsible for the use of thousands of other bulls that should have gone the packing house way.

Possibly no breed has suffered more than the Jersey breed because of the lack of official testing. And this statement is made with the highest admiration for the great world's records that cows of this breed have made, and the high average production shown in the official records of cows of this breed.

There was a time, not so many years ago, when registered Jersey cattle enjoyed an undisputed leadership among the dairy breeds in America, for production records. This naturally created a widespread demand for cattle of this breed, and in the scramble to buy breeding stock buyers fixed their attention on the breed, but neglected to keep in mind the real function of a dairy cow—the production of milk and butter in quantities sufficient to be economical and profitable. As a result, breeders asked and obtained prices for animals with little to recommend them as producers, that could not possibly be obtained today with our more general knowledge of the value of known production in the dairy animal.

All of us know that some animals of every dairy breed are profitable producers, and that their near relatives constituting a breed family are profitable producers. But it is against all the rules of animal breeding and common sense to say that a whole breed is profitable because one cow or a dozen cows of that breed have made known profits.

Facing these demands for known production in dairy animals, it would seem the part of good business on the part of the breeder of registered dairy cattle to prepare to meet the situation by establishing as far as possible the production of all his cows by official testing. It is only under such conditions that the breeder can intelligently talk to the dairyman who wants a bull of known producing blood, or can reasonably expect the best prices for his animals from other breeders.

Today there is a tremendous movement on foot among the Jersey breeders of the United States. There is

PILLING

A necessity for every farmer. Practical, reliable, easy to use. No veterinary experience required. Used and endorsed by leading live stock raisers and milk producers. Manufactured by the largest firm of its kind in the world—backed by 100 years' experience.

CASE NO. 3

G. P. PILLING & SON CO., 2234 Arch Street, PHILADELPHIA

nothing spectacular about it, and little noise yet. Go into any particular community where registered Jersey herds are found and at first glance you might not notice anything out of the ordinary, except that Bill Jones and Tom Smith and George Brown have all started to put a few of their cows on official test for entry in the Jersey Register of Merit. But just consider a moment that that same "except" is true throughout practically the breadth of the land, and you get something of an idea of the great result that will be presently made known to the world through the cooperative efforts of all the Bill Joneses and Tom Smiths and George Browns who are breeding and testing Jersey cattle.

This movement is being ably and vigorously directed and aided by the American Jersey Cattle Club, the national organization of Jersey breeders that has gained greatly in strength and renewed energy during the past two years. This great work means that through official records of known production the big profitable producing families within the breed are to be developed and their blood scattered throughout dairydom, and that by the same process the unprofitable families and individuals will be rooted out and their blood cut off from entry into our dairy herds. Under such cooperative effort the Jersey breed as never before is going to be able to meet the demand of the dairymen for known production and to gain for itself its legitimate share of places on the thousands of American farms that will be added to the list of dairy farms within the next few years.

A WESTERN QUEEN AND WESTERN KING GO EAST

Written for California Cultivator
By C. A. Briggs

F. B. Armstrong of the Oak Grove Dairy Farm has just sold that splendid Berkshire sow, Peggy Queen 7th, to the Hamilton Farms, Newark, New Jersey. "Peggy" weighs 565 pounds in her working clothes and looked good enough to J. W. Clapp, the Berkshire manager for the big eastern breeding farm, to give her a free ride across the continent. Mr. Clapp is here to take back another of California's best, Grand Leader II, A. B. Humphrey's Panama-Pacific grand champion, and 20 of his get that were recently purchased by Milton R. Thomas of Douglassville, Pennsylvania, the boar bringing the handsome price of $3000. California breeders can well feel good at this evidence that the East, long established in the breeding game, is recognizing the worth of the stock bred in the West and is coming after good ones. Exchange of fine animals will equally benefit both sections.

FIELD NOTES FROM THE LIVE STOCK MEN

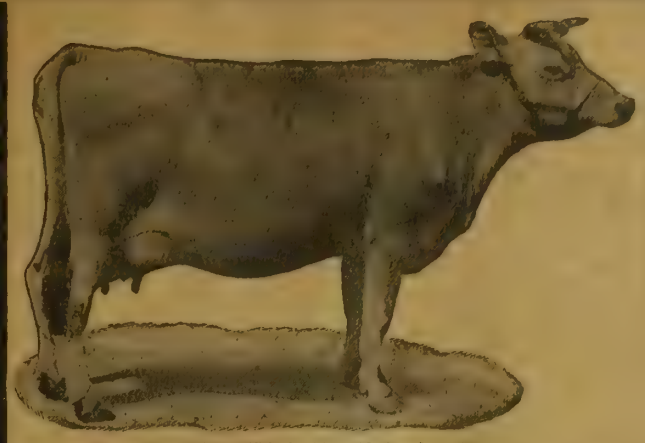
W. D. Trewhitt has recently sold a boar to E. W. Smalley.

Arlington M. Smith reports sale of a sow sired by Star Leader to H. H. Fowler and of five gilts to E. B. McFarland.

W. S. Guilford has recently purchased from the Oak Grove Dairy Farm five fall of 1916 open gilts for the Superior California Farm Lands Company.

Geo. A. Smith reports sales of registered Poland-Chinas: N. A. Cairns, 31 gilts; J. S. Bateman, three bred sows; C. H. Powers, sow and litter of seven pigs; F. J. Martin, two bred gilts and one boar; Rose Land Company, two bred gilts; R. C. Wilkins, one bred gilt and one boar; R. A. Steele, one boar; John Imbach, one bred gilt; R. E. Smith, gilt; A. A. Pluth, gilt; R. Kern & Son, one boar.

When properly finished the alfalfa grazed, barley fed hog makes a firmer, better flavored piece of bacon than the corn-fed hogs of the middle west. They do not yield as high a percentage in weight but this is not a disadvantage. Such a hog, however, must be fed grain from the time he is big enough to commence eating it until he is sent to the shambles. For five months of his life he should be allowed to graze and have from one and a half to two and a half pounds of grain per day. Then for 30 to 40 days he should be put up in a pen and fed all the grain he will eat.



DAISY WITCH, No. 19 In Catalog

PHILADELPHIA'S GLORY ZELLA, No. 20 In Catalog

Deep-Bodied JERSEYS

Depth of body, denoting capacity to handle feed and roominess to carry a sturdy calf, is one of the big things the keen judge of dairy cows looks for in his ideal cow.

Depth of body is one of the outstanding characteristics of Willowwood Herd of Registered Jerseys, owned by Mr. C. G. McFarland, Tulare, Cal., and they belong to families of great, deep-bodied Jerseys.

Their ancestors are the famous producers and world's record makers of the Jersey breed, and in this herd they have carried out the high production of milk and butter to which they are so richly bred in form and family inheritance.

Jersey breeders in America are today alive as never before to the value of Register of Merit records, and cows with Register of Merit records and sons and daughters of Register of Merit cows are in unprecedented demand, for the successful dairyman of today insists upon known production behind the sire of his future dairy cows.

With this demand in evidence, it is only upon rare occasions that an opportunity is afforded for the purchase of high class Register of Merit animals, but such a rare opportunity will be afforded when we sell at public auction, absolutely without reserve or limit, the entire

WILLOWWOOD HERD

60 REGISTERED JERSEYS 60

Owned by Mr. C. G. McFarland

TULARE, CALIFORNIA

Thursday, May 17, 1917

The sale will be held on Mr. McFarland's new farm, 12 miles from Tulare, 3 miles from Waukena, Tulare County, California.

It is entirely conservative to state that this is the greatest offering of high class registered Jerseys ever made at public auction in the West, and one of the choicest herds ever offerd for sale in the United States. The offering will include

13 REGISTER OF MERIT COWS with records averaging 516 pounds butter in one year, including the records of 2-year-olds and several under mature age.

3 COWS NOW ON OFFICIAL TEST, one of which will finish before sale, one in July, and the other about six months on test.

16 DAUGHTERS OF REGISTER OF MERIT COWS, the average Register of Merit records of the dams being 502 pounds 1 ounce of 85% butter in one year, including the records of several 2-year-olds and others under mature age.

16 COWS AND HEIFERS in calf to a half brother to Rosaire's Olga Lad, who has 19 Register of Merit Daughters averaging 526 pounds 3 ounces of 85% butter in one year, ages from yearlings up.

4 HEIFERS AND COWS in calf to a son of a cow with a Register of Merit record of 592 pounds 3 ounces 85% butter in one year.

Bulls

This sale is a most unusual opportunity for the purchase of a good young bull of splendid type and backed by high Register of Merit records. Not only will dairymen be able to secure bulls of known producing ancestry, but the owners of registered herds will find several that are qualified in every way to head high class breeding herds. Among those to be sold

A Half Brother to Rosaire's Olga Lad

(mentioned above) who is without doubt one of the very great sires of the breed today as measured by the production of his near ancestors and by the production of his daughters. The dam of this bull is 50% the same blood as Gertie of Glynllyn 2nd, Register of Merit 744 pounds 4 ounces 85% butter in one year, former world's 3-year-old record.

8 Grand Young Bulls

All out of Register of Merit dams, and the dams of the eight average 526 pounds 1 ounce of 85% butter in one year.

Heifer Calves

Since the catalog went to the printer there have been eight choice heifer calves, out of some of the great cows in the herd, added to the herd, and these will be sold.

Plan to be at this sale. It will be a milestone on the road to successful Jersey breeding for more than one man.

Every animal over six months of age tuberculin tested. Catalog now ready. A copy free on request.

The Jersey

Written for California Cultivator By W. P. McClaskey, Secretary Jersey Breeders' Association of Southern California

FROM the modest beginning of a few cows scattered among those who could afford the luxury of a cow imported from across the seas, the Jersey has grown to over half a million registered animals in the short space of a little over 60 years. Added to these are almost a countless number of grades and scrubs that carry the strains of the blood but which could not be in any registry. This is not a registry with here and there a shining light, but is a registry containing the names of thousands of great producers of milk and butterfat, for the Jersey is preeminently a dairy cow, and the uniformity with which this type and character are transmitted from generation to generation is truly marvelous. The Jersey is a wonderful little milk machine, and the persistency with which she continues her work from month to month makes her a joy to her owner. There is no fear that in four or five months her milking period will be over nor do you have fears that some change of rations or care will throw her off her feed and milk. It matters little what the feed or if sometimes she is neglected, she seems with almost human intelligence to feel that it is her duty to give milk and she proceeds to fulfill that duty with persistent regularity.

If it is milk and butter one wants the Jersey is there with the goods. To give milk is her mission.

The Jersey is not a beef cow; the Shorthorn takes that place. We make no claim of a dual purpose cow. She is beautiful, gentle to handle, a fine family cow and unsurpassed for the dairy. Her milk is high colored, looks good, and the cream that makes milk worth while for food is always there. She is uniformly a high tester; the low butterfat cow is the exception. More and more the consumer is demanding a milk that has more color, and he wants to see the cream in the neck of the bottle.

California, more than any state of the Union, is a state of diversified farming. We grow everything grown by the other states and many things peculiar to California alone. The possibilities of the state as a dairy state did not appeal to us until within recent years. There were so many things one could do to make a living which did not require the time and patience that dairying does. There were two seasons, wet and dry. There was no profit in cows which gave milk while the rains made pasture and went dry when they ceased and pasture dried up, but since the advent of extensive irrigation, the introduction of alfalfa with its numerous crops. dairying could be made profitable the year round.

The coast farmer is an alert business man. It did not take him long to see that live stock and dairying was the backbone of farming in all that great Middle West country. To gain the greatest profit from the soil its products must be consumed on the ranch. Dairying points a way to the profitable use of the products of the soil. It is marvelous how much of products of the farm can be made palatable to the cow.

The mildness of our climate makes it most fitting to the Jersey. She thrives here and does her best. Her value as a dairy cow will be more and more apparent as feeds continue to advance in price as they have in the past few years. No dairy animal can more economically convert the products of the farm into milk and butterfat than the Jersey.

Little by little the Jersey is finding her way into California. There have been some herds here for more than 30 years, but they have been comparatively unknown in a territory so large as our state. The Jersey breeder has not been making much noise, always proud of his stock he has let them speak for themselves by their performance at the milk pail, but during the past year the Jersey breeders have been getting together in little groups here and there and organizing into associations, each with a feeling that it is time for the Jersey to come to her own in California. It should be made known how well this state is adapted to the Jersey breed, and how well the Jersey is adapted to the conditions of California and how splendidly she performs when given an opportunity. We are surprised at the number of owners and breeders of pure bred Jerseys and at the number of cows in the state. They are found from the extreme north to the southeast corner, Imperial Valley, but when the length and breadth of the state is taken into consideration they are comparatively few. The cow with some marks of the breed is far from being a pure bred Jersey.

The lovers of the breed are legion. All cannot own them. The cost of pure bred stock has been prohibitive to many, and grading up by the use of a pure bred sire seems a long way around to the many. But there is a

Col. Ben A. Rhoades, Auctioneer, Los Angeles

real pleasure in watching the growth and development of a dairy herd. Almost invariably dairymen tell you that their best cows are heifers they have raised themselves from their best producing cows. They take great pleasure in the development of those heifers and cows, they expect much of them, and are less often disappointed than in stock they get that is sold on the open market. How much is this pleasure and profit enhanced when they know that in these heifers are the blood of a 200-year-old ancestry, and that the chances of her paying her board and a profit besides are many fold greater than in the offspring of scrub stock.

The slogan of the Jersey breeders should be "Watch the growth of the Jersey breed in California in the next ten years." It will be great, because this preeminent little dairy cow by her own performances will make her own way and win by merit alone.

LIPSA DECLARES A DIVIDEND

NEW champion Jerseys are today a frequent occurrence. This is bound to be the case, for Jersey breeders are not only breeding with an eye to the future, but are officially testing. With 3540 cows on test in 449 herds scattered throughout 47 states, no record can remain long unbroken.

Ohio has a new champion Jersey, Lipsa 323967, whose record of 11,509.3 pounds milk, and 684.32 pounds butterfat not only sets a new standard for her class, the junior two-year-old, but teaches a lesson in profitable milk production.

Lipsa, freshening with her first calf, started on test at the age of two years and five months and weighed 673 pounds. On the day she finished her record, she tipped the scales at 884 pounds, a gain of 211 pounds during her test period. This significant gain should be borne in mind when studying her feed record.

The value of an official record insofar as it concerns the cow and her progeny has never been questioned. But it has often been said that the milk and butterfat produced by a cow in a record year was made at great expense and was unprofitable. Lipsa's record refutes this absolutely.

An accurate record of her feed and its cost was kept throughout the test. This record shows that Lispa consumed $134.54 in feedstuffs, which includes grain, hay, ensilage and roots. The feed record is given her in full.

Feed	Lbs.	Cost Per ton	Cost
Bran	779.5	$28.20	$10.99
Corn meal	473.0	37.50	8.86
Gluten	1021.0	30.65	15.64
Cottonseed Meal	370.5	39.36	7.29
Ground Oats	859.0	35.14	15.09
Schumacher	111.0	27.25	1.52
Oil Meal	279.5	43.40	6.05
Peanut Meal	52.0	40.00	1.04
Hay	4074.0	15.00	30.56
Ensilage	3250.0	6.00	9.75
Beets	55.5	* .50	27.75
		Total	$134.54

*Per bushel.

Lipsa's production of milk sold by her owner at ten cents per quart brought $541.60. Deducting the $134.54, cost of her feed, she returned $407.06 over and above her feed cost. Lipsa also presented her owner with a heifer calf, which is not for sale at any price, and constitutes an "extra dividend."

The Ohio state university supervised Lipsa's test, having sent its testers to her owner's farm 22 times during the year. She was also tested on one occasion by the head of the Register of Merit department of the A. J. C. C. Her record showed remarkable persistency and regularity, the best month's yield being 61.97 pounds fat and the yield of the twelfth month in lactation 58.05 pounds fat.

Lipsa is sired by Hood Farm Torono 35th and out of Alexie 201585. She is owned and was tested by R. L. Pike of Fairview Farm, Geneva, Ohio, and was bred by Hon. E. Stevens Henry, Rockville, Connecticut.

Alfalfa makes the best quality of hay if it is cut just as it is coming into bloom, say when it is one-fourth in blossom. It will be more digestible if cut at this period and there will be less loss in leaves than if cut later. If cut earlier there will be a reduction in yield.

SOPHIE'S BERTHA

"LIKE begets like or the likeness of some ancestor." This great law of breeding is usually quoted at farmer gatherings and dairy meetings by experts to drive home to breeders the fact that, in order to have the best kind of dairy cows, one must mate animals of the best dairy strains. A remarkable instance of the application of this law is the case of Sophie's Bertha.

Sophie's Bertha 313238 is now world's champion junior three-year-old Jersey, having produced 14,954.2 pounds milk, 829.54 pounds fat on a year's test started at three years five months of age. Her dam, Lass 66th of Hood Farm 271896, is the senior three-year-old champion, and her sire's dam, Sophie 19th of Hood Farm, is the breed's highest producer, a champion out of a champion, and by the son of a champion.

Sophie's Bertha's pedigree shows production in every line. Her sire, Pogis 99th of Hood Farm 94502, has 24 daughters in the Register of Merit, two of them champions, (Sophie's Bertha and Sophie's Adora 299594, junior four-year-old, 15,852.2 pounds of milk, 888.0 pounds of fat). Her dam, Lass 66th of Hood Farm, after making a splendid two-year-old record, broke the world's record by producing 17,993.7 pounds of milk, 910.6 pounds of fat. For grandparents "Bertha" has such animals as Hood Farm Pogis 9th 55552, a champion in the show ring, son of the famous Figgis 76106 and sire of 78 daughters and 14 sons in the Register of Merit; Sophie 19th of Hood Farm, the champion of champions, and Hood Farm Torono 60326, a sire of 73 daughters in the Register of Merit, seven of which are ex-breed champions and one a present world's champion. Sophie's Bertha surely has a grand array of ancestors, and "blood will tell."

Sophie's Bertha is not unknown to the world's dairymen, for as a two-year-old she won a gold medal and second place in her class, with a production of 13,242.8 pounds milk, 771.1 pounds fat. The summary of her work is as follows:

Age Years-Months	Milk Lbs.	Fat Lbs.	Butter 85% Lbs.	Butter 80% Lbs.
2—2	13,242.8	771.1	907.1	963.9
3—5	14.954.2	829.5	975.9	1,036.9
Total	28,197:0	1,600.6	1,883.0	2,000.8

Over 2000 pounds of 80 per cent butter in the first two lactations is production extraordinary.

Sophie's Bertha is famous for other things besides her production and ancestry. She was sold at the Hood Farm sale, in May, 1916, to Ayredale Stock Farm for $5000, which is the highest price ever paid at an auction sale for an American bred Jersey.

In butterfat production the new champion exceeds the old, Goldie's Nehalem Beauty 283330, by almost 75 pounds and she advances the milk record of the class, which was held by Lucky Farce 298177, with 14,184.8 pounds, almost 800 pounds.

Sophie's Bertha was bred by Mr. C. I. Hood, Lowell, Massachusetts, who also bred her sire, dam and grandsires. She is now owned by Ayredale Stock Farm, Bangor, Maine.

Youngster on University Farm
High bred Jersey of the University Farm School at Davis.

GRIND THE COARSER FEEDS

The grinder, cutter and shredder of the coarse stock feeds are gradually forcing their way into the hands of dairymen and live stock men generally.

Chas. S. Hardy, San Diego County, has the most unique and probably the most up-to-date feeding plant to be found anywhere in the United States. He has his plant equipped with a grinding machine of large capacity. This machine grinds hay, bean straw, alfalfa or any substance that is fit for feed. It grinds the material down to a 5-16 size, and from the machine that grinds the material it is blown by a blower of a cyclone collector which holds all of the good material, and the device is arranged so that the dust is separated from the feed. Then when the ground product is delivered from the bottom of the cyclone collector it is dampened with an ordinary garden sprinkler.

Ground feed will absorb its weight in water; that is, if you have ten pounds of ground material you can absorb ten pounds of water in this without having any water to drain off. This moist food is allowed to stand for 12 hours. Twelve hours it seems, develops sugar and is just the right length of time to let it stand. Then it is fed to the cattle and sheep in stalls. There is no waste.

MARCH RECORD TULARE COW TESTING ASSOCIATION

By Charles Klint, Tester

In answer to your letter we are sending you our roll of honor for the past month, giving owner, name of cow, breed, pounds milk, test, pounds fat:

Ralph Smith, No. 23, H.-F., 1914, 4.6, 88.04.

W. J. Higdon, Thelma, H.-F., 2334, 3.6, 84.02; Paula, H.-F., 2243, 3.3, 74.02; Pearl, H.-F., 2097, 3, 62.91; Leda, H.-F., 2355, 2.8, 65.74; Jewel, H.-F., 2022, 2.5, 50.55; Acadia, G., 1409, 4.8, 67.58; Queen, G., 1559, 4.2, 65.48; Amy, G., 1290, 4.6, 59.34.

A. S. Legueira, No. 12 H.-F., 1437, 4.4, 63.23.

A. A. Jenkins, Exile, J., 1392, 4.6, 64.03.

P. L. Hoyt, Lineback, H.-F., 1926, 3.1, 59.71; Star, S., 1125, 4.6, 51.75.

Chicago Ranch Co., 61, H.-F., 1416, 4.2, 59.47; 4, S., 1158, 4.7, 54.43; 56, H.-F., 1266, 4.1, 51.91.

J. F. Smith, Daisy, H.-F., 1659, 3.4, 56.41.

Geo. Beck, Kiz, S., 1467, 3.8, 55.75.

E. M. Cate, 45, H.-F., 1050, 5.2, 54.60.

E. L. Thompson, 3, H.-F., 1872, 3, 56.16; 20, H.-F., 1536, 3.4, 52.22.

W. A. Jenkins, Stub, J., 1113, 4.8, 53.42.

H. Cereney, Edison, H.-F., 1224, 4.1, 50.18.

These are the picked cows producing 50 pounds of fat or over in a period of 30 days. Our association has grown steadily and made a 100 per cent gain during the past year. We now have around 1000 cows on test.

BREED BETTER

FROM addresses by Judge Shields and Prof. True before the annual meeting of the Amador-El Dorado Live Stock Association at Placerville on April 7 we quote much valuable information :

Judge Peter J. Shields

One of the most deplorable conditions of the great war today is the death of the great number of livestock. Think of the loss of the priceless animals, the fine Belgian horse, the cattle of Germany, and the destruction of northern France where some of the best cattle of the world were raised.

In the United States the big range business is rapidy breaking up, and men with smaller numbers of cattle are taking their places. You are not going to conduct your business as your fathers did. Each generation is going to stand on the foundation of what has gone before. Their conditions were vastly different from yours. Your fathers had to make the roads, find the ranges, and pastures. You have the small ranges, good roads, and closer markets.

There is less actual work on the range for you, but more head work. There will be less bronco busting, which was at best, an expensive pastime. You are confronted with different conditions.

There are many problems for you to work out that will better the industry. There is much work in the reseeding and renewing of the pasture grasses in the high mountains. Thoughtful men have drained a little pice of land and planted sweet grass in place of the sour grass. Clear out the encroaching tamaracks that are taking the place of feed for another cow.

Increase the production of the foot hill ranges. Think what it will mean to you to put on an extra pound of flesh on an animal.

The big thing today is to breed better animals. The animals are not as high bred as they should be. You are breeding cattle today such as we bred 100 years ago. Why do you stay back? The world is going ahead. The purer the animals you breed, the better the result.

When you are holding up your herd, they are holding you up. Your herd is a judge of your manhood. If you do not like the looks of your cattle, change your breeding.

You do not know what you may be called upon to do in the coming months when our country is at war. Your patriotic duty at the present time is to carry on your business so that there will be a greater and better food supply for the nation.

* * *

Prof. Gordon H. True of the University Farm at Davis, spoke first of correspondence with officers of the diffent cattlemen's associations of the state with reference to sending representatives to Davis during "Farmers' Week," beginning Tuesday, May 26, and ending June 1, when there will be a program of special interest to persons running range cattle on the reserve. Continuing, he said:

Prof. Gordon H. True

Stock are being better bred today than the old stock. I noticed particularly the fine stock of Modoc and Lassen Counties. They would bring high prices on an eastern market. These men have been taking advantage of the times, and using only pure bred bulls on their range and the stock shows a decided advantage.

With the high price of beef at 10 cents a pound, the buyers are more discriminating in their buying and are passing over the poorer classes of stock. We must do the very best we can for the improving of the livestock.

In calling for men for the army the expert farmer will be exempt from draft as a large food supply will be greatly needed. Put our line of work in line with the times and improve our business so that the supply will be the very best, not only for the army but for the people at large.

The time has passed for immense ranges as well as large numbers of range stock. The mountains of California and the western states are bound to be range country, but there is no reason why we should do our cattle business in the old Texas way.

Continued on Page 523

A Grandson of

Prince Gelsche Walker

out of a 34 Pound Dam

Here is a real herd header. His sire is Prince Aralia Walker, son of Prince Gelsche Walker and Aralia De Kol 3d, a 28-pound daughter of Aralia De Kol, the former world's record cow. His dam is the great young cow, Gerben Abbekerk Maid, who dropped five calves, all of which are living, before she was 6 years old, and made a 30-pound record and a 34-pound record within 12 months. She is a splendid individual and will be reasonably sure to increase her record at next calving. This bull is only one of the many features of the sale we will hold for Stalder Bros. at their

ROSAMOND FARM

Riverside, California

TUESDAY, MAY 22, 1917

When the total offering will consist of

60 Registered Holstein Cows, Heifers and Bulls

16 Registered Percheron Stallions, Mares and Colts

60 Grade Holstein and Jersey Heifers

The offering of registered Holstein-Friesian cows and heifers will be of unusually high quality, including

13 A. R. O. COWS AND HEIFERS WITH RECORDS UP TO 28.07 POUNDS BUTTER IN 7 DAYS.

15 DAUGHTERS OF A 28-POUND SON OF PRINCE GELSCHE WALKER, sire of the California champion junior 4-year-old Lady Hiske Walker, 34.24 pounds butter in 7 days.

20 SPLENDIDLY BRED HEIFERS AND COWS in calf to a 34-pound grandson of King of the Pontiacs.

Bulls

Besides the great young fellow mentioned at the beginning of this announcement, there will be sold an extra choice lot of young bulls. One of them is a grandson of Prince Gelsche Walker and out of a 28.91-pound cow. Five more are by a 34-pound sire, out of good dams, and a fine bunch of individuals.

Everything over six months tuberculin tested.

Registered Percheron Horses

Horses will be horses for years to come, and the man who breeds and owns the best will reap the benefits according to the excellence of his stock. Everything points to the greatest demand for Percherons in the history of the world. The offering of registered Percherons carries the best blood of the breed, and in it are young stallions that will make great sires; brood mares that are proven great dams; fillies that will develop into great brood mares.

At the conclusion of the sale of registered stock we will sell for Stalder Bros.

60 High Grade Holstein and Jersey Heifers

a desirable lot of dairy stock that dairymen who are looking for good young stock will find satisfactory.

Sale will be held on Stalder Bros.' Rosamond Farm, 13 miles west of Riverside, 3½ miles south of Wineville, California, beginning promptly at 9 a. m., Tuesday, May 22, 1917. Parties arriving at Riverside by train will find free conveyance to the sale at Mission Inn Garage.

Catalog now ready. A copy free on request.

Why Use Dirty Coal-tars or Dangerous Carbolic Acid

When B-K the POWERFUL disinfectant (NOT A POISON) is worth from two to seven times as much on the basis of germ-killing strength alone—and costs only a trifle more? Consider that B-K is powerful yet not a poison; that it is clear and clean as water and as easy to use. Then you will understand why it is entirely in a class by itself as a farm disinfectant. Anyone can safely use B-K for spraying barns and stock—hog pens and poultry houses—for dipping birds and stock—for mixing in drinking water through which contagious diseases are spread. You should use B-K regularly. If your dealer does not sell it—send us his name. Dealers Wanted in Every Town

LUMBER

AAA—Lumber, New and Second-Hand; rough, $10 M; finished, $15 *A*R. W. shingles, 45c bundle. Dan P. Dolan, 1639 Mission St., San Francisco, Cal.

BREED BETTER

(Continued from page 521)

We are using the domain, and must use it to the best possible advantage.

Our practice of bringing our cattle in from the summer range and turning them out to winter by simply "roughing it," coming out at the end thin, is poor business. Count the number of pounds lost at seven cents per pound.

There is no place today for the steer over two years old. Every one over that age on the range is one in the place of a cow that might be raising a calf. This is one way of increasing livestock: Get your animals to market at an early age and replace them by breeders on the range.

By better breeding of stock we get a higher percentage of dressed beef. Eliminate the under weight for the steer of greater weight. The tendency of the time is not only for better cattle but the better maturing of cattle.

For years there has been an International Livestock Exhibition at Chicago. This is purely a meat making animal show. This year there were exhibited an 11 months old steer weighing 1130 pounds, the champion of the times, and the other a two-year-old weighing 2700 pounds. Both were from California.

• • •

From addresses of other speakers the Cultivator will later give extracts, especially from the paper by Dr. J. H. Hamond of the bureau of animal industry, which discussed "Preventable Losses of Live Stock."

STATE DAIRY COW COMPETITION

The University of California announces results from which we quote as to cows which produced over 40 pounds of butterfat during March, 1917.

IN the following report the name of the owner is given first, then a list of the cows with the performance. The abbreviations Gr., Ay., G., H., J. stand for grade, Ayrshire, Guernsey, Holstein and Jersey.

The first figures after the name of the cow indicate age (or where age is not given it is indicated by dash). For instance "Riverside Beauty 2d, H. 7-7" means that animal is a Holstein aged 7 years and 7 months. The next figure (84 indicates number of days in milk at beginning of the month, the next number (1921.2) production of milk in pounds for the month, and the last two numbers, percentage of fat (3.60) and pounds of fat (69.163) for the month.

The Cultivator Patterns

8324—Ladies' Waist. Cut in sizes 38 to 42 inches bust measure. The waist has a separate overblouse.

7830—Girls' Dress. Cut in sizes 6 to 12 years. The long waist-body of this skirt is gathered to a plaited skirt.

8070—Ladies' Dress. Cut in sizes 36 to 44 inches bust measure. The dress is cut in one piece and closes at the front.

7860—Ladies' Shirt Waist. Cut in sizes 34 to 42 inches bust measure. Figured and plain materials make up this waist very prettily.

8344—Children's Dress. Cut in sizes 4 to 10 years. Long or short sleeves may be used.

8357—Ladies' Overdress. Cut in sizes 36 to 44 inches bust measure. This over dress slips on over the head.

7852—Ladies' Skirt. Cut in sizes 22 to 32 inches waist measure. The skirt is cut in three gores.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

THE PERFECT DAY

When you've started the day with a bunch of pep
And a zest for the old ham and—;
When you've swung to work with a springy step
As the tasks of the day you planned;
When you've pitched right in and raised merry hob
With the work that you found to do,
With a brain so clear that the meanest job
Was easy as pie for you—
Then the feeling you have as you hit the hay
Is a feeling of great content,
And that is the end of a perfect day,
Of a day that has been well spent.
—Baers' Fasts.

CANNING

Written for California Cultivator
By Clara I. Remington

OUR home gardens are about all planted now, and the growing season is well under way. With the newspapers full of war news, foretelling food shortage and mounting prices, our minds naturally turn to the question, how shall we store for winter use our surplus vegetables.

Drying is, of course, the simplest and least expensive method of keeping some of them. We will, all of us, undoubtedly carry over all the dried beans possible. Beans must be fumigated to kill weevils, so it is well to be prepared with a bottle or two of carbon bisulphide. Chemicals will not get any cheaper with the increased demand.

After drying comes the very important business of canning. Jar tops, rubber rings and extra jars should be purchased now, before the tin shortage and increased price of glass cause them to become scarce and very expensive.

Beans

We will begin with Kentucky Wonder beans, which are about the first vegetable to produce in abundance. The same process will apply to any string beans, corn, peas, okra, asparagus, Lima beans, and in fact, about any vegetable one may wish to preserve.

The style of glass jar is of importance. It should have a glass top and a wire spring at the side for sealing. Only pint and quart jars are used in these directions, but if half gallon jars are to be used, increase the time of boiling one half hour.

There are excellent patent steamers for use in canning but the ordinary clothes boiler provided with a false bottom made of mesh wire or strips of wood to prevent the jars breaking, will answer. Have the kitchen swept and dusted to insure an atmosphere as free from bacteria as possible before beginning to can.

It is desirable that all vegetables be canned as soon as possible after gathering, as they lose in flavor and texture very rapidly after growing stops. Carefully select only the young and tender beans, string, cut them in short lengths, and wash well. Pack each jar full, pressing down firmly; add a teaspoon of salt to each jar, fill to the top with cold water, put on rubber ring and glass cover, bringing up the wire spring loosely over the top. Now place enough jars in boiler to stand easily on the false bottom without crowding. Pour three inches of water in boiler, the idea being to have only enough water to sterilize with hot steam without boiling away. If you use gas, oil or gasoline you can have your boiler standing over the burners, before puting in jars. Then when all is ready, light the gas. This is less work than lifting the heavy boiler full of jars, as would be necessary to set it over a fire. Cover the boiler closely, bring the water to a boil and boil for one hour.

Then uncover the boiler, letting the steam escape and lower the spring on the side of each jar, sealing it and preventing outside air from penetrating.

This sterilizing kills all bacteria contained in the jar, but leaves the seeds or spores which hatch out when the jars are cold. So we must go over the whole process again the next day, being sure to raise the spring on the jar before sterilizing begins and lowering it when the water, which, of course, has been replenished, has boiled one hour. This sterilizing effectually kills all bacteria but for an extra precaution, authorities say we should repeat the process the third day.

Be sure to leave the jars in the boiler until cool, to prevent breaking sometimes caused by the hot jar being chilled in the outside air. The jars should be kept in a cool dark pantry two or three days and then tested by raising the spring and removing wire from top. If the jar can be lifted by the top, it is thoroughly sterilized and will keep indefinitely in a cool dark cellar or storehouse. Light injures the color. If the top comes off, when lifted, the contents must be resterilized or thrown away, depending on how far decomposition has advanced.

To open the jars, run a thin knife blade under the rubber, next the jar to let in the air, but if this is very difficult, as it very often is, place the jar with wire loose in a deep pan of cold water, bring to a boil and keep boiling a few minutes, when it will open easily.

Corn, Eggplant, Etc.

For canned corn, gather the ears, husk and brush them with a stiff brush, cut off the grains with a sharp knife and pack the jar full, as with beans, adding salt and water, and sterilize. Lima beans may be canned with corn for succotash, but require an hour and a half sterilizing, as do also mashed vegetables, such as summer squash, pumpkin, etc. Eggplant should be cut in slices and stood in boiling water for about 15 minutes before packing in jars. In canning asparagus use only the tender tips.

A delicious addition to soups and stews may be made by canning two or more vegetables together. I always cut up a bell pepper to every can of tomatoes and some people add an onion. Tomatoes are easily canned by placing the jars, tops and rubber rings in a pan of cold water, bringing it to a boil and boiling ten minutes, when the jars may be filled with hot stewed tomatoes, the tops fastened securely and the jars inverted until cold. I find it less trouble to sterilize them by filling the jars cold and placing in the boiler. The tomatoes retain their shape and consistency better.

When the chilly fall days arrive, and we can no longer make the rounds of our gardens every day, gathering a dinner from this bush and that vine, it will be with a feeling of great satisfaction that we reflect on our cellars, well stocked with sacks of beans and potatoes, and case after case of nourishing canned vegetables, sanitary in every detail and ready for almost instant use. We will have performed a substantial duty to Uncle Sam towards victory in this war, where food promises to take such a prominent part.

HOME CANNED VEGETABLES

Written for California Cultivator
By Ella C. Gamble, Amsterdam

HOME canned vegetables are certainly a good means of keeping down the living expenses. The following methods are tested and give the best results. The vegetables will keep perfectly and expense of canning them is so small that the cost of these vegetables for winter use is a very small amount per can.

Of course a steam pressure canner is most convenient but the wash boiler or a ten-gallon lard can will answer the purpose, or even a pail will do. Make a false bottom for the boiler of a board bored full of holes with a few nails driven in to prevent the board from resting on the bottom of the boiler. Set the jars on the board so that they do not touch one another or the side of the boiler. I use pint or quart glass jars.

Fill the boiler with water till it comes to the necks of the jars. This is to insure uniform cooking of the contents. Be sure to have a close fitting cover for the boiler. Place wire handles on each end of the board on which the jars stand so you can lift it from the boiler to handle the jars.

The following rule is known as the cold pack method and if carefully followed will give good results. I intend to can peas, string beans, corn and tomatoes, but the rule is good for asparagus, spinach, beets, carrots and parsnips as well.

QUALITY KEPT UP

In homes where *Quality* and *Satisfaction* are first essentials—*there* you will find

CHUBBUCK'S IDEAL GOPHER TRAP

Larger than runway; jaws pull rodent in; catches large or small gopher and holds it. Farmers say it's worth dozen other makes. Big sales. Price 50c. If not at your dealer's will send it to you postpaid 2 for 95c; 6 for $2.70; 12 for $5.10. Money back if you are not satisfied. Free circulars.
E. J. Chubbuck Co., Dept. A San Francisco, Cal.

Every time you buy an article, advertised in the California Cultivator, at the local store you do your town some good.

Be sure to can them at once after picking them; within an hour if possible. Brush the silk off the corn and cut it off the cob as close to the cob as possible, string the beans and shell the peas, peel the other vegetables and slice if large. Pack the jars full, add a teaspoon of salt to each quart and fill the jar full of water. Put a rubber on jar and put top on loosely.

Put in canner which has been filled with cold water to come at least to the neck of the jar. Bring water to a boil and let boil one hour. Then screw the lids on tight and let cool. The next day put the jars in the canner again, loosen the tops and boil for one hour. Then tighten the tops and set away. The third day loosen the tops and place in canner and boil again for one hour; tighten tops, then set away in a cool dark place and they will keep perfectly.

String beans may be placed in a crock raw, first a layer of beans and then a layer of salt until filled. Then pour on cold water and hold down with a weight.

CORN, BEANS AND TOMATOES

Written for California Cultivator
By Mrs. D. W. Crist, Yorba Linda

I HAVE two ways of canning green beans and both have proved satisfactory. The recipe with vinegar seems easier to keep, but with salt a little nicer to prepare for the table.

Canning Beans

String tender green beans and break in several pieces. Cook until tender but not soft. Drain off all water and fill your cans with them, keeping hot as possible. To can with vinegar. Put a cup of vinegar to a quart of water and pour boiling over beans and seal. To can with salt. Take a cup of salt to two quarts of water and fill can with it as hot as can be and seal.

To prepare either way for table use. Drain off liquor and cover beans with cold water. Bring to a boil and drain. Add enough hot water and a piece of bacon and cook as fresh beans.

Canning Tomatoes

An easy way to can tomatoes. To one gallon of boiling water add a teacup of salt. Drop whole tomatoes in that have been peeled and cored and cook until tender. Dip them out with a wire spoon and fill cans and seal quickly.

For soup I use all pieces of tomatoes and small ones and cook and run through coarse sieve. Add salt to taste and heat and fill cans and seal.

Dried Corn

This is not a canning recipe but the corn I prepared this way has been a great help to me. Prepare green corn as for cooking and cut from the cob carefully. Put in a dripping pan and add about a teaspoon of salt, a tablespoon of sugar and butter the size of walnut to a dozen ears of corn. Set in the oven and let it cook thoroughly, stirring often. Then spread on cloths and dry in sun or a gas oven set on top of the back of cook stove is a good way to dry and easier to keep from flies. Heat corn well when perfectly dry and put it in a flour sack and hang in a dry place for a while. It may then be put in a covered can or other vessel. To prepare for the table soak the corn for an hour or so, season to suit and add cream.

CANNING IN TIN

Written for California Cultivator
By E. H. Barnharts, Alpaugh

TAKE stringless green pod beans. Pick while tender. Can as soon as possible after picking. Break in pieces, wash thoroughly. Put them in a muslin bag, drop in hot water, cook eight minutes after they commence to boil. Drain off water. Have No. 2 solder hemmed capped cans. You obtain these cans from a canning company. Get a soldering tipper, some wire solder, some soldering flux and a little brush at the hardware store. You are ready now to can all kinds of vegetables.

Wash and scald cans, put in one teaspoon salt, fill with beans, cover with water. Do not have beans or water touching top of can or they will not seal. Wipe the top dry with cloth, put on lid of can, take the brush and wet the solder on lid with the soldering flux. Have your soldering iron hot enough to float solder. Don't close vent hole in lid.

Take a wash boiler, put in cans, put in water to come within two inches of top of can. Put on stove until cans are hot. Take out and seal vent hole in lid. When you have two tiers of cans ready for boiler cover with water. Boil without stopping three hours after they commence to boil.

I have canned vegetables this way for eight years and I am sure there isn't anything nicer than a variety of canned vegetables.

You say a woman cannot operate a soldering outfit. Yes she can, just as easy as melting sealing wax. I expect to can peas, corn, pumpkin, tomatoes, vegetables for soup, asparagus, sweet potatoes, string beans. You can can all kinds of fruit and meat.

CANNING VEGETABLES PAYS

Written for California Cultivator
By Mrs. H. P. Monroe, Carlotta

IT certainly seems as if we must look to our home gardens, as prices still continue to soar.

Last year I canned peas, beans, corn, tomatoes, cabbage, carrots, white beets, summer squash and turnips.

I had very few bottles spoil and intend to can the same and anything more that we grow this year.

I gathered my vegetables and put them up the same day. I prepared as for table, cutting into small cubes or slices so as to get as much in the jars as possible. The corn I cut from the cob and the tomatoes I scald and peel and put whole into Golden State Mason jars. Jars must be carefully washed of course and new tops or caps for Golden State Masons and Economy and new rubbers for the other Masons.

I fill my jars, add a level teaspoon of salt, fill with cold water and place top on firmly but not too tight. I have a wooden frame to fit my boiler, placing my jars on this. Then I fill nearly to the shoulder of the jar with cold water and cover to keep in steam. Place over a fire and boil three hours. Lift out, screw down top tightly and set by to cool.

I certainly think it pays, especially where there are growing children.

RICE A GOOD POTATO SUBSTITUTE

Eating rice instead of potatoes, provided that the diet is varied, is good economy now that the price of potatoes is so high, according to Prof. M. E. Jaffa, of the California state board of health. The brown or natural rice, containing a large amount of mineral matter and other vegetable food products, is much more desirable than the white or polished rice. Vegetables, milk, meat, or fruits, rich in mineral matter and other products, must be included in the diet if white rice is used.

The housewife purchases a large amount of water at a high price in buying potatoes, for about 75 per cent of their weight consists of water. Such is not the case in buying rice. A pound of cooked rice will weigh from two and a half to four pounds, because of the water added in cooking; but a pound of cooked potatoes weighs no more than a pound of raw potatoes. The reason for the economy in the use of rice is obvious.

Brown rice contains four times as much mineral matter as white rice, according to Prof. Jaffa, but unfortunately, the bran and other portions of brown rice removed in polishing and which are so rich in desirable food products, are now fed to poultry and cattle. If the water in which brown rice is cooked is discarded, much of this valuable mineral matter will be lost. For this reason, steaming or preparation in a double boiler with no excess water added is recommended.

Wound Up.

A truly eloquent parson had been preaching for an hour or so on the immortality of the soul.

"I looked at the mountains," he declaimed, "and could not help thinking 'beautiful as you are, you will be destroyed, while my soul will not.' I gazed upon the ocean and cried, 'Mighty as you are, you will eventually dry up, but not I.'"

The high record, trap-nested hen, the A.R.O. cow, the well finished steer, the well grown colt, the prize hog:

Whatever you raise that's a bit better than the ordinary, is worth an auto-photo-graphic record. And you can make such a record, with the data on the negative. It's a simple, permanent, inexpensive and almost instantaneous process with an

160 ACRE FARMS IN WESTERN CANADA FREE

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat at over $2 per bu. offers great profits to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops

You Can get a Homestead of 160 acres FREE.

and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of **Oats, Barley and Flax.**

Mixed Farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

There is now an extra demand for farm laborers to replace the many young men who have volunteered for service in war. The government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

Limited Number of Chicks from Hens That Laid 194 Eggs Each Last Year

Wishing to help poultrymen to get high grade stock for building up their flocks, we have made arrangements so as to offer a small number of chicks from F. M. Molby's famous 194-egg hens.

So long as they last we make this offer: With every order for 500 White Leghorn chicks we offer FREE 25 Molby chicks and with every order for 1000 chicks we offer 50 Molby chicks free.

SCHOFIELD and OLSEN AT VAN NUYS will sell choice pullets 10 weeks old, all broken to roost at 55c each. This is for a short time only. Address all communications to

Tells why chicks die

E. J. Reefer, the poultry expert, 4265 Reefer Bldg., Kansas City, Mo., is giving away free a valuable book entitled, "White Diarrhoea and How to Cure it." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every batch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

PROFIT IN GREEN DUCKS

Written for California Cultivator
By Jean A. Koethen

FOR some reason the business of raising "green" ducks for market has never been very popular among California poultrymen. Perhaps it is because this is not exactly a duck climate; perhaps because the Pekin duck has an unenviable reputation as an extraordinarily large eater—perhaps merely because duck raising is a little less certain than chicken raising. Be the reason what it may the fact is that only now and then does one hear of a poultryman who dares attempt market ducks on anything like a large scale.

An exception to this rule is found in the poultry colony of Inglewood. This section, being quite near the ocean, is more favorably located for duck raising than the hotter inland valleys, beside being near the city of Los Angeles, and even a hasty trip through it reveals a good many small duck plants, while the signs "Duck Eggs for Sale," "Baby Ducks for Sale" may be seen on nearly every block.

G. C. Ely, a chicken rancher in the Inglewood Acres district, has been more than ordinarily successful in this branch of poultry raising. His duck plant is comparatively small, less than 40 Pekin breeders, but the eggs from these 40 breeders keep the incubators running at full capacity during the duck season, and ducklings in 100 duckling lots pass from baby duck brooder to bigger duck brooder, and from this to half grown duck coop as rapidly as they can be cared for.

Duck eggs are usually fertile, and fertile duck eggs rarely fail to hatch. A neighbor of Mr. Ely's showed me a 100-egg incubator in which about 97 ducklings were already in sight, and said she had just sold a similar hatch. This simplifies duck raising considerably. On the other hand, ducks cannot be raised at all seasons as chickens are. Mr. Ely and some of his neighbors have experimented with raising ducks in the fall. The breeders laid a sufficient number of eggs, the eggs hatched, but nearly every duckling died.

The duck eggs are hatched in incubators, the temperature being kept a little lower than for chickens. The first night after hatching the ducklings are kept in the incubator nursery. Next morning they are removed to the baby duck brooder, which is merely a small box with hover and provision for ventilation. No heat is used. The ducklings keep each other warm. The brooder is, however, carried indoors for the first week or so.

Nothing could be more simple than Mr. Ely's duckling pens which are made of boards ten or 12 inches wide, laid on the side. Each pen is just large enough to permit the ducklings to move about freely, for ducks do not need exercise as chicks do, and the less exercise a green market duck gets the better. As the ducklings grow they are transferred from one pen to the next and given room according to their size, but never more than they need. As soon as the ducklings outgrow the baby brooder they are transferred to pen No. 2, which is considerably larger and contains a good-size double fireless brooder. Ducks at this age grow very rapidly, and their sleeping quarters must allow for this.

The ducklings are not fed till they are two days old. The morning of the second day they are given some clean sand on a board and later in the day fine cracker or bread crumbs are scattered over the sand.

Real feeding begins the third day out of the incubator. Bran with considerable sand mixed in it is made crumbly wet and fed on the board four or five times a day. Water is given in chick fountains but the ducklings are not allowed to get wet. It is a rather curious commentary on the eternal fitness of things that ducklings and goslings, both water fowls, are more easily injured by wetting than chicks in their first babyhood. Later on they might, of course, have a pan or puddle to swim in, but I saw nothing of the sort on this plant. It is not necessary, and makes the duck yard a mussy, bad smelling place.

The tenth day a little corn meal and a little cut-up green stuff is added to the bran and sand, and this is gradually increased until at four weeks of age the ducklings are on a mash which is equal parts bran and corn meal, with 15 or 20 per cent of green stuff added. I asked Mr. Ely if he did not think this a rather small proportion of green, and he replied that the proportion depended entirely on the amount of green available. "You feed what you have", he remarked, with a twinkle in his eye, which is, I fancy, just what most poultry raisers do, regardless of what they or others recommend.

From the time the ducks begin to eat heartily this moist mash or bran, corn meal, green stuff and sand is kept before them all the time, for the green duck must be brought to marketable size as rapidly as possible. These ducks are marketed at about ten weeks of age, when they should weigh from four to five pounds apiece. Mr. Ely sold his green ducks last year for from 17 to 21 cents a pound, averaging a profit of about 30 cents per duck.

The care and feeding of the breeding ducks is as simple as that of the ducklings. They are confined in a large yard, two-thirds of which is green range, partly barley, partly grass and other greens. The ducks get their green feed for themselves from this range and are fed in addition a moist mash which is mainly bran, a little corn meal being added. This is fed night and morning.

Activity is the life of the laying hen. As her activity decreases, so does her egg production. The hen that stands around all day and scarcely has enough energy to eat food placed before her is never a laying hen.

Keep a sharp lookout for lice and mites and use good insecticides freely. Where small runs must be used, scrape out the droppings for use in the garden land and spade up the runs often. After spading rake in a few oats.

Every variety of insect except bees and rose bugs are good for the youngsters. Bees are sure death to ducks and young geese.

Cleanliness is the easy road to disease prevention—cleaning the droppings-boards should be followed by a liberal dusting with slaked lime.

Never mind how many more you hatch than you need; sell those that are in the way. There's money in them.

Northern California poultry breeders report more sales and inquiries for hatching eggs, chicks and breeding stock than for several years past.

THE

American Beauty Dust Sprayer

will rid your crops of

PESTS

SAFETY FIRST

RED SPIDER

and mite, mildew, rust and insects on grape, peach, prune, pear, almond, citrus fruits and garden crops—they are already at work—dust now, and "get them before they get you." You will need a full crop this year. Save it while you can.

"A Puff in Time Saves the Vine"

The American Beauty is the fastest and easiest working machine on the market. Throws a perfect cloud—no lumps, no clogging. Uses least material—does most work.

For sale by all progressive dealers. Or send us $11.00 for the vineyard size—$13.50 for the orchard size. We will ship, all charges paid. Try it a week. If not pleased return at our expense, and will refund your money.

We Fully Guarantee Every Machine.

Citrus Fruit Market

LOS ANGELES, May 4, 1917.

Some poor and wasty stock has been going forward. This makes a showing of much lower average prices and some stock, especially in auctions, has sold at about freight and packing charges. Good stock regular sizes is holding fairly firm.

Shipments

Shipments of oranges from Southern California since November 1, 1916, 21,421 cars, lemons 3685, total 25,106; to same date last year, oranges 18,609, lemons 2986, total 21,595. From Central California to date this season, oranges 4061, lemons 164, total 4228; to same date last year, oranges 4623, lemons 146, total 4769. From Northern California to date this season, oranges 845, last season, oranges 610, lemons 1.

DISPERSAL OF WILLOWWOOD JERSEYS

Willowwood Jerseys, the great herd that we will disperse at public auction for C. G. McFarland at Tulare, on May 17, are apparently claiming the attention to which they are rightfully entitled by reason of their splendid production records, excellent type, and general good quality. Requests for information regarding this herd are coming in not only from many points in California, but from every western state and several of the eastern states. It is good to note in this connection how many of the inquiries particularly request information about the Register of Merit cows and their daughters. This is additional evidence of the present widespread demand for Jersey cows with Register of Merit records and daughters of such cows.

When we consider that the highest Register of Merit record in the Willowwood Herd is 658 pounds seven ounces 85 per cent butter in one year, and that the 13 Register of Merit cows to be sold in this sale average 516 pounds in one year, it is readily seen that there are no mean records present, for the average includes several two-year-olds and others under mature age.

Willowwood Herd is a clean, well bred, well developed bunch of registered Jerseys, the kind that the progressive breeder must have to keep up with the procession, and Mr. McFarland's decision to disperse this entire herd opens up the door to real opportunity to those who want to own some of the best Jerseys to be found in the west today.—C. L. Hughes, Sales Manager, California Breeders' Sale and Pedigree Co.

ORPINGTON YEAR BOOK

The Orpington Club of California is a live wire bunch, as is indicated by its 50-page year book with illustrations of some of California's fine producing Orpingtons and illustrations of Orpington breeders. The president of the association is W. J. Stewart of Alhambra, secretary, L. C. Geiser, San Gabriel.

LAYNE & BOWLER
PUMPS
EVERY western rancher KNOWS that from his standpoint this is going to be the most prosperous year in the history of the country IF his water supply does not fail. Have you fully prepared to bring your crop through with the greatest success? Make sure your irrigation facilities will not fail you at the critical time by installing a Layne & Bowler Pump. Don't wait. Prepare now. Our Catalog No. 30 gives full details. Ask for it.
Layne & Bowler Corporation
900 Santa Fe Ave. Los Angeles

HIDES SKINS

Send us your cow hides, sheep pelts, goat skins, mohair, wool and raw furs.

Green salt hides, over 30 pounds, 22 and 21c. Dry, over 15 pounds, 37c.

Highest prices paid for wool. Don't sell your wool before getting our quotation.

Write us for full particulars.

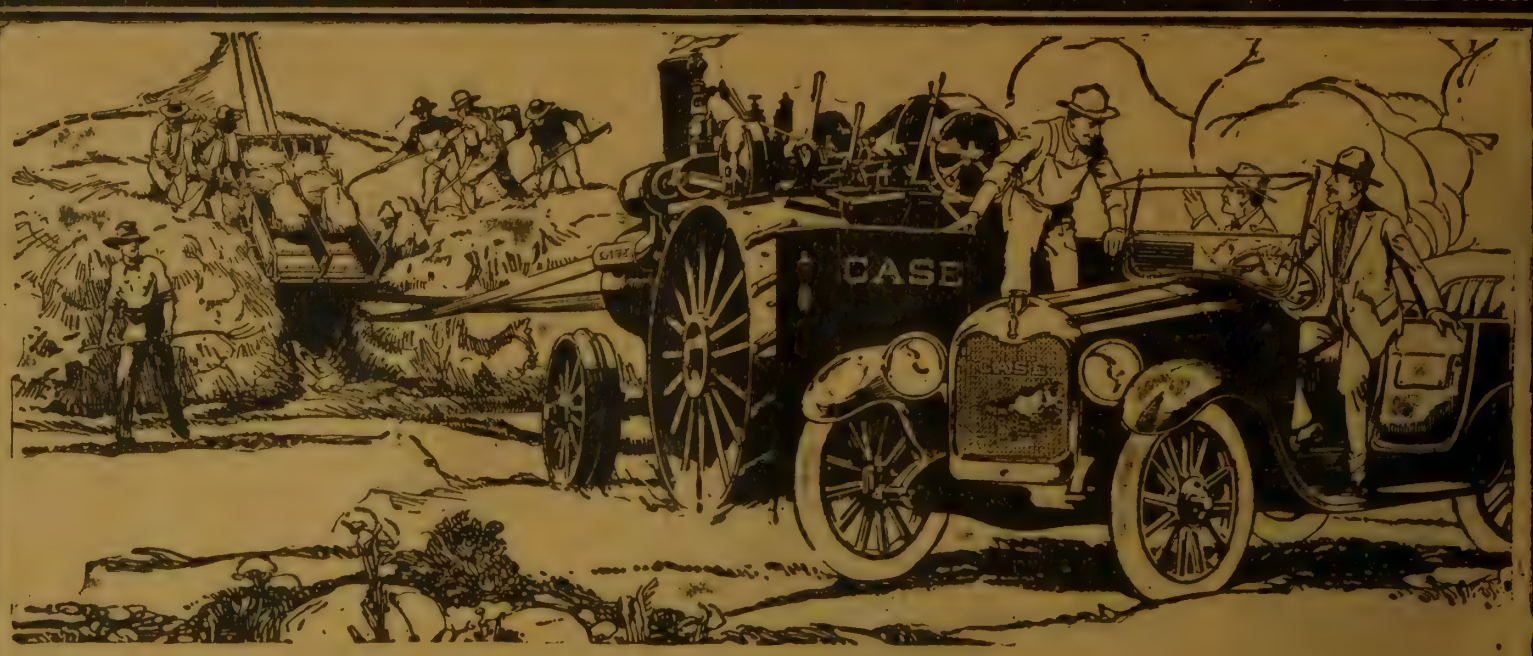
Sacramento, Cal.



FARMERS EVERYWHERE PREFER CASE THRESHING RIGS

Case steam engines for years have been acknowledged the *simplest*, the *most powerful* and *most economical* in the steam class.

Year by year Case has set the pace in improvements. Case steam engines have no equal for pulling capacity, ease of operation and all-'round efficiency. They meet the boiler laws of all states and Canadian provinces.

Thousands of farmers all over the world prefer Case engines to all others. These users are our best salesmen. The reputation of Case engines has passed from farm to farm and from generation to generation until today Case steam engines are the standard by which all others are judged.

They come in nine sizes—18, 30, 40, 50, 60, 65, 75, 80 and 110 h. p., a size for every farm or need.

Write today for our complete Case catalog. It is an album of information that no farmer should be without. It is most beautifully printed, with many interesting scenes and reproductions in colors. It costs you merely the price of a postal card. *Write today for this free catalog.*

* * * *

Nowadays it is generally known that **Case steel threshers** are superior. Most farmers want their crop threshed with Case machinery. Many predict the complete dominance of Case threshers. This great demand is the result of only one thing—Case threshers are the *right* threshers. Case principles of construction and Case performance have never been equaled.

Here are a few reasons why Case sells more threshing outfits than any three other concerns:

1. Case threshers get all the grain there is in the crop, and—deliver it *clean* in the sack.
2. They are all-steel; fire, wind and water proof. No warping or rotting of main frame.
3. They are easy to operate—fewest belts—least amount of power needed. Lubricate them while running.
4. The cylinders are big and strong enough to handle damp and long straw. Weed-filled, moldy or stack-burnt bundles don't matter. The grain is always well cleaned and brings top prices.
5. Absence of interior cranks, forks, pitmans, hangers, aprons or other revolving parts back of our concaved beater next to cylinder. Therefore nothing to wrap or wind with straw or twine. *They thresh* from morn till night for weeks, months and years without delay.

These superiorities have given Case threshers the lead they hold today. Study them carefully before you buy. Write for our catalog giving detailed information.

CASE BALING PRESSES please the farmemost. Baled hay offers the biggest profit.

Case Baling Presses are built in two sizes—14x18 inches and 17x22 inches. They are constructed of the best materials and are unexcelled in workmanship.

The same superiorities of design and material that characterize all Case products are equally noticeable in Case balers.

Don't forget that **Case Ensilage Cutters** are best for silo filling. We offer three sizes, all mounted.

Uni-Lectric GASOLINE-ELECTRIC UNIT LIGHTING SYSTEM

Electric Light for Your Farm

Uni-Lectric lighting plant generates standard 110-volt direct current; operates from one to fifty lights, electric motor, electric iron, vacuum cleaner, electric toaster, force pump, churn, washing machine, etc. No Batteries—No Switchboard—and a better machine for less money. High speed gasoline motor, generator and automatic governor, all complete in one small, compact unit. Uses standard lamps and fixtures. Simple, easily installed, dependable, economical. Costs less than other systems to buy and to operate.

SALT LAKE ROUTE

REDUCED FARES FOR SUMMER TRIPS

For vacation or business trips the Salt Lake Route offers, on May 31st and certain dates in June, July, August and September, round trip tickets at greatly reduced fares to many Eastern points. For instance, to Chicago and return, $80.00; New York, $118.20; St. Louis, $77.50; St. Paul, Minneapolis, $84.45; Missouri River, $67.50; Denver, $62.50; Salt Lake City, $40.00, and many others.

Return limit 3 months, but not after Oct. 31.

The ideal vacation trip is to the American Wonderlands, Yellowstone National Park and Glacier National Park, both easily reached via Salt Lake City.

Round trip fares are reasonable and the world has no more marvelous sights.

Full information of all these trips, train service, etc., at all offices of the

Sorghums for Grain and Sorghums for Roughage Invaluable This Year. Growing Hints from University Bulletin

INASMUCH as the grain sorghums are summer grown-crops, making their growth during the dry season of the year, too much emphasis cannot be placed upon the preparation of the seed bed and the care of the crop during the growing season. Especially is this important since the grain sorghums will, in most cases, be grown as a dry land crop. We should not lose sight of the fact that although they are as a class drouth resistant, the yields which will be obtained will usually be in direct proportion to the condition of the soil and the amount of moisture available. It is therefore desirable to handle the soil so that a good seed bed can be prepared and as much of the precipitation conserved as possible.

Preparation of Seed Bed

When possible the land should be plowed in the fall or early winter to a depth of eight or ten inches and allowed to lie in the rough until spring. In this condition the soil will absorb a large proportion of the winter rainfall and will also be materially benefited by weathering action. Unless the field is very weedy no further treatment will be necessary until it is to be prepared for seeding, at which time the seed bed can usually be prepared with a disk and harrow. If for any reason spring plowing becomes necessary it should always be more shallow than fall plowing, otherwise too much moisture will be lost by evaporation and difficulty will be experienced in working the land down properly for seeding. In fact, except on the most favorable soil more work is always required to prepare a good seed bed on spring-plowed than on fall-plowed land.

The seed bed should be smooth and even, with a mulch of two to three inches on the surface, while the soil below the mulch should be firm and moist. This condition is imperative as the seed of most of the grain sorghums is rather soft and rots easily if the soil is too cool or porous or the moisture supply insufficient for prompt germination. As has formerly been stated, such a seed bed can in most cases be prepared on fall-plowed land without difficulty with the ordinary implements found on the farm. Spring-plowed land, however may require more work in order to pack the subsoil sufficiently and to pulverize the surface properly.

Time of Seeding

The time to plant the grain sorghums will vary to some extent with the location and with the character of the soil. Planting should not be done until the soil and atmosphere are quite warm. In the valleys in the southern portion of the state where the warm weather begins earlier in the spring the crop may be planted earlier than in the north. Again, light, sandy soil warms up more quickly than heavy soil and can usually be planted a week to ten days earlier than the latter type. Results obtained at Davis indicate that in that section at least, the best time to plant is from the 10th to the 20th of April. If planted earlier the atmosphere and soil are too cold for the best growth. On the other hand, if planting is delayed until after the first of May the soil is apt to become too dry for prompt germination unless irrigation can be provided. On irrigated land seeding may be delayed until the middle or latter part of June, though the total yield will seldom be as great as when planting is done earlier. In some places, however, this fact is made use of by employing the grain sorghums as a second crop to follow grain, grain-hay, or other similar spring crops.

Method and Rate of Seeding

The most common method of planting the grain sorghums is to use a corn planter fitted with sorghum seed plates. With this implement the seed is drilled in rows three to three and one-half feet apart, spacing the seed from four to six inches apart in the row. In some cases the grain drill has been used for planting the crop by stopping up enough of the holes to give the proper spacing between rows. This implement, however, is not to be recommended as it seeds too shallow

Planting and Pruning Lemons

J. P. Englehart, a Veteran Lemon Grower Who Has Consistently Stayed by His Own Orchards for Thirty or More Years, Has Studied His Trees and Tells Cultivator Readers Some of the Lessons He Has Learned

THE great period of deterioration in citrus fruit trees that has been creeping upon us for 25 years or more has happily been dispelled by our indefatigable government representatives, Mr. Shamel and Mr. Scott, who are insisting on bud selection. Unfortunately, since Mr. Shamel has so wisely called our attention to budding from performance record trees, some of us are again relaxing our vigilance. Others misunderstand and do not carry out his suggestions correctly. In fact it looks as if we were again about to face another such period. To be sure, intelligent people whose attention has been called to this matter are now budding from such trees, but is that enough? No, some do indiscriminate selecting of buds, not being able to tell apart the different kinds of wood.

Select the tree first, then select record bearing wood to bud from. Some budders look for fine looking fruit on a performance record tree and take fruit spurs adjoining such fruit, which, if it should be shipped, might after all prove deficient in keeping quality. Fancy looking fruit on the tree can easily be tested as to keeping quality before shipping. Just lay some of it aside and see how it cures. When we cured our lemons we noticed that after curing some of these very lemons that would have been selected as a guide to budding were soft and pithy, while others that were produced from certain hard, dark wood were ready to ship as strictly fancy. The fruit of shipping quality is the only profitable fruit.

Two Types

Eureka lemon trees, one of shade tree type and one budded from bearing wood.

We believe that this is one of the causes of decay in transit. Oranges have been picked from drone wood and found to decay in transit. How can we tell the good shipping fruit on the tree? Study the wood. Drone trees are found to be made up of sucker wood and white, soft wood; while the performance record tree consists mostly of firm, hard wood and is dark in color. Almost any tree of medium quality can be made a performance record tree by careful pruning year after year, especially if taken in hand when young. Cut out the drone wood. This gives the fruit wood a chance to grow and finally get the upper hand.

The best wood from which it is safe to bud may be found sometimes in mediocre trees, but in limited quantity only. It is hardly safe to use this unless you are a judge of wood. One can tell it by the way it droops as well as by its color and texture. The best wood has an angular growth, but not all fruit wood that grows angularly is the best.

As a rule only the quantity of fruit produced is considered in grading the performance record tree. At present quality is not so much considered. Our observation has been that the two go largely together. Therefor for the present we might let well enough alone, if there were not this danger of deterioration. When the good fruit wood gets the upper hand in a tree its

Mr. Englehart Showing Mr. Teague

"You see this tall almost sucker-like growth? That must be suppressed—cut off—while this shorter fruit-bearing wood is allowed to remain. If this is done all over the tree a fruitful tree will result."

Bigger Crops by Blasting

"The O'Connor prune orchard in the Santa Clara Valley was blasted in 1913," says the California Cultivator. "Its largest crop in six years was 3,900 pounds. After blasting the crop was 8,000 pounds—more than double—in a dry year. The prunes from the blasted orchard were much larger and the trees made a better growth." By using

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

in *your* orchard you can increase your crop, add to the water-storage capacity of the soil, and enable the roots to feed on fresh plant food in the subsoil.

Hundreds of fruit growers in all Pacific Coast States plant their trees in beds made with Giant Farm Powders. They have found that trees in blasted ground grow faster, bear earlier and yield better than those planted the old way. They use the Giant Farm Powders because these powders loosen and powder the soil instead of packing it. Ask your dealer for either of the Giant Farm Powders—Eureka Stumping Powder or Giant Stumping Powder.

Free Book on Fruit Growing

Every fruit grower will find valuable information in the Giant book, "Better Orchard Tillage," written to suit Pacific Coast conditions. It tells and shows how to plant trees and subsoil orchards in the most effective way. This handsome illustrated book—or others—free. *Mail the coupon.*

Boost Your Citrus Trees Now

The grade of fertilizers determines the grade of Citrus Fruits. Chilean Nitrate has one hundred per cent of its Nitrogen Nitrated, and is ready to go into action the instant it is applied. It brings quicker, surer results than all others because they have to be Nitrated first. Why not buy your farm munitions ready for use, not subject to losses which the other Nitrogens always suffer? Common sense dictates that money is saved by its use. Its low price compared to others strongly commends it to the business grower.

DR. WM. S. MYERS, Chilean Nitrate Propaganda
25 Madison Avenue, New York

What are Pedigreed Trees? We want You to Reason Before You Buy Citrus Trees.

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries,—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertiliser, labor, investment tied up in land—these are the big factors that go to pot if, years after the trees are planted, the grove bears miscellaneous offspring.

50,000 Valencia, Navel Oranges
Eureka Lemon Trees

First National Bank Bldg. **WALKER-HUBBARD NURSERY CO.** San Fernando, Cal.

fruit will not only look fancy but have keeping qualities.

Firm, close-grained wood makes the heavy bearer of firm heavy fruit, which is the good shipper. Certain texture or grain in the wood produces like texture in the leaf and fruit. In fact bud variation can be traced back to wood variation. As the bud wood, so is the bud that springs from it. As the bud, so is the limb that arises from it. As the limb, so are its leaves. As the leaves, so are the blossoms and the fruit. In fact the character of the root affects all of these factors that finally form the fruit.

Let us analyze a drone tree. It will be found to be an aggregation of drone wood, drone leaves, drone buds and drone fruit, all easily identified by similarities. A perfect performance tree will be found to be composed of performance wood, performance leaves, performance buds and performance fruit, all alike in certain characteristics.

Another thing that may be overlooked is the age of the tree that you bud from. Use mature trees only, unless the tree is a thoroughbred, and even then be careful. The young thoroughbred tree, that is, the one budded only from the best fruit wood, matures earlier and has its wood hardened earlier.

If the performance record tree has some drone wood, and you happen to use that for budding, you might not improve your tree at all. Of course, the chances are that the buds you are superior, especially if you look performance wood. Even the ign ant budder will probably stumble better wood than he would find on ordinary tree. Many people make performance tree far more quickly a more satisfactorily by careful pruni year after year according to the wo You do not lose so much time. Th remove all suckers when just starti and all detrimental poor materi Many mediocre trees can be th profitably treated. Pruning accordi

Three Kinds of Growth

Here is a growing tree budded at same time with three kinds of "wood". Th tall lusty growth pointed to Mr. Englehart is sucker or strong growing wood whic should never be used. Then behind the netting is fruiting wood and "white wood" both of much less vigorous growth.

to wood will do more to form a pr ductive tree of quality than to top-bu from anything at random in a perform ance record tree, unless of course, i happens to be a perfect tree.

There is some danger that our orch ards will again deteriorate after short period of improvement. Wh not prevent this by studying budwood Look at the limbs back of the twig from which you cut.

A ten-year-old lemon tree persiste in having curly leaves on certai limbs. We rebudded these limbs yea after year with the very best buds, an again and again they came out curly We dug down to the roots and found the roots curly and knotted. It was form of root called bench root. Our only recourse was to take out that tree and replant. Thousands of such trees, which are drones in part, are at the present day in our orchards. The question is, "Will they respond to re budding?"

County Quarantine Powers

STATE Attorney General U. S. Webb has given his opinion regarding the matter of inter county shipments of trees and plants, or rather the powers of county horticultural commissioners, especially their power of forbidding entrance into one county from another. In a letter to State Commissioner Hecke he says:

"I have before me your communication of April 3 with enclosed correspondence wherein you request the opinion of this office as to the rights of a horticultural commissioner 'to refuse to admit nursery stock to a county without inspection because of its having come from a section where certain injurious pests are known to occur, even though in refusing to do so he is acting under the authority of an ordinance passed by the county board of supervisors of the county in which he is operating.'

"The correspondence which you have enclosed concerns the validity of a county ordinance purporting to vest in a county horticultural commissioner power to quarantine against any district adjudged by him to be infested with injurious insects or diseases. You do not expressly request the opinion of this office upon the validity of this particular ordinance, but I presume that you desire to be advised generally as to the power of a county to provide by ordinance for the establishment of quarantine.

"In opinion numbered 2574, rendered by this office prior to the amendment of 1915 to section 2319c of the political code, this office held that one county may legally pass an ordinance the operation of which will effect a quarantine against the horticultural products of another county and serve to prevent the importation of those products unless they pass the inspection tests prescribed by the ordinance if such ordinance affects those products not because they are the products of a particular county but because they are products which come within the class of products against which the ordinance authorizes a quarantine. In other words, it was there held that such an ordinance and the power of quarantine to be exercised thereunder must not be directed expressly against a particular county or the products thereof but must be general in its operation so as to subject all products to the prescribed test irrespective of the place or county where the same are raised or from which they are imported.

"By the amendment of 1915 to section 2319c of the political code, it is expressly provided 'that no quarantine shall be established, maintained or enforced for the protection of nurseries, trees, shrubs, plants, vines, cuttings, grafts, scions, buds, fruit pits, fruit, seeds, vegetables or other articles of horticulture against contagion or infection by the injurious diseases, insects or pests, except by such commissioner and in the manner in this section provided.'

"This language in 2319c which was added by amendment in 1915 (Statutes 1915, page 79) evidences in the clear est language an intention on the par of the legislature that the power of quarantine be exercised exclusively b the commissioner of horticulture wit the approval of the governor. Suc an enactment is doubtless within th police power which the state enjo and I perceive no constitutional obje tion thereto. A county is vested b virtue of Article XI, Section 11 of th

state constitution with power to make and enforce within its limits all such local, police, sanitary or other regulations as are not in conflict with general laws, and this power cannot, of course, be questioned. Sections 2319c is a general law, and any attempt by a county to enact an ordinance providing for the establishment or maintenance of a quarantine on horticultural products would be in direct conflict with that section and would, therefore, be invalid. This view is fully supported by the opinion of Judge Rogers in Howard & Smith v. Brock, copy of which you have enclosed.

"In our opinion number 2266 addressed to your office we advised that a county horticultural commissioner could not, acting under state laws, reject shipments into his county of diseased nursery stock without inspection and that the state law did not authorize him to quarantine nursery stock shipped from another county.

"In our opinion number 2495, addressed to your office, we advised that the state commissioner alone (with the approval of the governor) could establish a quarantine for the protection of one county against another county or state, and that the county horticultural commissioner had no such power under the laws of the state.

"As the county can neither enlarge or diminish the powers conferred upon the county horticultural commissioner by the laws of the state so as to conflict with general state laws, it follows that no county horticultural commissioner may refuse to admit, without inspection, the nursery stock shipped from another county, not under quarantine by the state commissioner, and no county ordinance can sustain the attempt to exercise such power."

Time to Get the Red Spider

Written for California Cultivator

WHAT is prettier than a clean, thrifty, well kept orange or lemon orchard? He who has such an orchard cannot gather all his profits into his own storehouse, he has to share its beauty with his neighbors and all who come his way.

Even I have been reaping my share of the beauty of the famous citrus orchards adjoining Los Angeles and surrounding towns. From the first of my visit here I noticed that some orchards have less leaves than others and on investigation found that the same little old "red spider" that makes us so much trouble in Fresno County in June, is at work here now. It is doing its worst to spoil the beauty of these famous orange groves and the crops in which the owners have invested their money, time and interest.

Those leaves which the spiders cause to fall are absolutely necessary to enable the tree to produce fruit of the best quality. What is "worse and more of it", the vitality of the tree is lowered by red spider attacks so that it takes it two or three years to recuperate. So you see it affects not only this year's crop but next year's crop also.

Over in my home locality, Reedley, I have seen farmers equipped with knapsack sulphur machines let the red spiders cut their crops in half as well as damage the trees. I cannot see how people can be so careless, or ignorant, for after a fellow sees it happen once, he ought to be able to "get wise".

Here, around Los Angeles, I find the growers are not acquainted with the use of the knapsack type of sulphur machine. Some of these growers who use sulphur for the control of spiders have been accustomed to wait until the trees were literally covered with the pests, then go in with a power sprayer, and, as one grower said, "shoot a ton of sulphur on a 20-acre orchard."

This method of treatment is all wrong. In the first place, by the time the trees are so thoroughly infested that you "cannot help seeing them", the damage is largely already done. Secondly, the extra amount of sulphur used is not only wasted, but is an actual detriment. The little particles of sulphur are so piled up on each other that they cannot vaporize, and when caught and held on the leaves so long interfere with picking and the proper cultivation of the grove. Some of the lemon growers say that pickers refuse to work in a grove that has been heavily sulphured. While not injurious, it is a very unpleasant experience to get sulphur in your eyes.

My experience in the use of sulphur for red spider control began in 1900 For three years I threw it on by hand. This is wasteful and the worst method for getting sulphur on one's clothing and in one's eyes. I have met orange growers, 13 years behind the times, who applied it this way last season. I have used a number of knapsack sprayers also, in the order in which they were offered for sale. I found the European types defective in one way or another. I began the use of an American Beauty last season and with it can reach the tops of the highest trees.

The secret of success lies in taking one of these machines and going through the orchard early, before the spiders have spread all over the trees. Give a puff here and there, where colonies are starting and "nip them in the bud." With a little practice one can locate these colonies in walking by without stopping to examine the leaves for them. You have applied enough sulphur when the particles are one-half to one-quarter of an inch apart on the leaves.

In my own work I begin early and treat four rows as I go. I controlled the red spiders on my 12-acre orchard of eight year old trees with 22 pounds of sulphur last season. Anyone can do the same who is willing to mix a little "horse sense" with his sulphur.

TREE RECORDS

Many plans of keeping more perfect records of the performance of various trees have been devised. One of the best of these was that issued by the Cultivator something over a year ago, as used by A. D. Shamel of the department of agriculture, who has been so active in proving out the worth of bud selection and testing of orchard trees. A few copies of these records are in hand in the Cultivator office for sale.

Now comes an entirely new one, "Dexter's Orchard Hand Book." This is a pocket-size book with four different forms for keeping complete record of every tree in the orchard, this as to production, irrigation, cultivation and general orchard care. The only criticism we have of it is that it is rather complicated for the busy orchardist to utilize. It is put up in neat leather container and may be carried in the daily work.

EVER HAVE ONE?

"What sort of a hand is that new hired man of yours, 'Lias?" asked Farmer Medders of his neighbor.

"What kind of a hand?" roared the irate neighbor. "He ain't no hand at all, consarn him. He's a sore thumb!"

SURE, HE WOULD!

List of Varieties We Grow:-

Standard Oranges: Washington Navel, Valencia Late, (Paper Rind, St. Michael, Ruby Blood, Navelencia and Jaffa.)

Standard Lemons: Eureka, Villa Franca and Lisbon.

Standard Pomelos: Marsh's Seedless, Triumph and Imperial.

Standard Limes: Tahiti Seedless and Mexican.

Standard Kid Glove Oranges: Dancy Tangerine, King Mandarin, Willow-Leaved Mandarin, Satsuma-Oonshiu.

Table and Ornamental Oranges: Golden Nugget Navel, Golden Buckeye Navel, Sweet Seville, Bouquet des Fleurs, Golden Variegated.

Garden and New Citrus Fruits: Sampson Tangelo, Sweet Lemon, Sweet Lime, Golden Variegated, Ponderosa, Seedless Lemon, Citrus Limonum, (Dwarf Lemon), Thornless, Rangpur and Red Limes, Lue Gim Gong Orange, Nagami Kumquat, Algerian Satsuma Orange, Algerian Tangerine Orange and Citron of Commerce.

Combination Citrus Trees: Budded to from four to six different varieties of fruit.

May and June

Are THE months of the years in which to plant TEAGUE QUALITY CITRUS TREES—grown from carefully SELECTED BUDS that will produce productive crops of quality fruit. We carry all the standard commercial sorts, kid glove varieties and the new introductions of value. Correspondence is invited and price list cheerfully furnished on application.

Sixty dollars a ton for apricots is now being paid in the Hemet Valley, according to recent reports.

Preservation of Vegetables Without Canning

By Wm. V. Cruess, University of California

WE have become so accustomed to using vegetables from cans (or fresh), that we do not realize that they can be successfully preserved in a palatable and nutritious form by other methods. The scarcity of tin cans and glass jars makes it imperative that these other methods be used this season if any great quantity of vegetables is to be kept for use next winter.

The can factories report that no cans are available for home canning and that the large canneries themselves may not have enough for their own needs.

The methods described below are not especially new, but it is believed that they are not all generally known. They are very simple, cheap, effective, and can be used from the smallest to the largest scale.

Drying Vegetables

All root vegetables, such as potatoes, carrots, turnips, beets, etc., can be dried successfully by exposing them on trays to the sun. The vegetables should first be washed, peeled if necessary, cut into pieces about one-fourth of an inch thick, spread on trays or sheets of paper, and exposed to the sun until dry. Potatoes, carrots, turnips, and beets will dry in this way in two to four days. Onions require longer.

The appearance and general quality of all these root vegetables (especially potatoes) can be improved, the rate of drying can be increased, and molding during drying in foggy weather can be avoided if the vegetables are exposed to the fumes of burning sulphur a short time before drying. An ordinary fruit sulphuring box may be used for this purpose. If one of these is not available, the cut vegetables may be sulphured by exposing them on trays to the fumes of burning sulphur in any fairly tight room or box. A box may be constructed of rough boards and covered with building paper to make it fairly air tight. Cleats may be nailed to the inside walls to hold the trays during sulphuring. The box is made without a floor and one side is made into a door to admit trays. A hole about a foot square and 12 to ten inches deep is dug in the ground at one end of the box. A pan of burning sulphur is placed in this hole after the trays have been stacked in the box. The door is closed and the vegetables left until sufficiently sulphured. The time necessary is from ten to 20 minutes. The sulphured vegetables are then exposed to the sun on trays or paper till dry.

Peas and string beans should not be sulphured because of the bleaching action of sulphur fumes. Peas should be shelled and string beans should be strung before placing them on trays. They both dry rapidly.

Corn is cut from the cob and dried on trays very successfully.

The dried vegetables must be kept in covered crocks or tight boxes or heavy sacks to prevent insect injury. Before being used for cooking, the dried vegetables must be soaked in water about 24 hours. They may then be cooked and served in ways similar to those used for fresh vegetables. By proper seasoning and preparation, dried vegetables can be made into palatable dishes. Their nutritive value is not perceptibly changed by drying.

By Salting

Wash, peel, and cut the vegetables into pieces about one-fourth inch thick. Weigh them. Weigh out one pound of salt to each three pounds of vegetables. Place a thin layer of salt in the bottom of a crock or barrel or wooden bucket in which the vegetables are to be stored. Then build the vegetables and salt up in alternate layers until the container is full, using one pound of salt to three pounds of vegetables. Cover the vegetables with a layer of salt. Place a piece of wood on top of the vegetables and a heavy weight on the piece of wood. In 24 hours the vegetables will be found covered with a heavy brine formed by the salt and the juice from the vegetables. The vegetables will have greatly decreased in bulk. More sliced vegetables and salt in the ratio of one pound of salt to three of vegetables may be added to fill the jar or barrel and pressure applied again. Keep the vegetables immersed in this brine by means of a light wooden weight until they are to be used. If they show signs of spoiling add more salt. Before cooking soak out the excess salt as is done with salt fish or parboil a short time for the same purpose.

Do not use metal containers because the metal will dissolve in the brine. Use crocks or barrels or other wooden containers.

In Brine

Make a saturated brine by stirring three and one-half to four pounds of salt in a gallon of water. If it does not all dissolve at once, leave it in the liquid because it will dissolve when the vegetables are added later. Wash the vegetables. Slicing is not necessary. Place them in the brine and keep immersed by wooden weights, until needed. If signs of spoilage are noticed at any time, add more salt.

Vegetables may be kept in salt or brine indefinitely and make good substitutes for the canned or fresh vegetables. The most expensive grade of salt is not needed. It would pay communities to buy salt in ton or half ton lots if any large quantity of vegetables are to be put down in salt or brine. It will cost not more than eight dollars per ton f.o.b. factory if bought in this way. The cost for salt under these conditions would be not more than one-fourth cent per pound of vegetables.

Ornamental Planting Calendar for May

Northern California

Written for California Cultivator By A. R. Gould

THIS month many of the subjects which have been well established will be in flower in the perennial border, and we must also complete the planting of our annuals if possible.

Asters

These should be planted in solid colors and it will be necessary to watch for slugs on these as they appear to have a special liking for them.

Lobelia and Other Edging Plants

These will soon be ready to plant out and provide a rich display.

Begonias

Begonias (Tuberous and Fibrous Rooted) may be planted out during this month. The former will only thrive in the shade in fairly rich soil. Some very charming effects may be obtained by planting them in window boxes and having the trailing lobelia hanging in front. The pendulent type may also be used in hanging baskets in this way.

Dahlias

Tubers should now be planted in the prepared section which is to be devoted to them. Cuttings may be secured of many varieties which have formed strong shoots. Place these in sand in a warm situation and keep shaded. In a few weeks they will be ready to pot or plant in boxes, and they will even flower this year. Solid beds of singles in one color are very effective. The same applies to collarettes.

Roses

At this time aphis are generally giving trouble on the roses. Spray with "Black Leaf 40" or Aphine. You may

Fertilizer Quality

When you buy a ton o fertilizer remember you ar buying what is in the good and not merely two thous and pounds.

When a smelter buys a ton o gold ore he insists on knowing th number of ounces of gold it contains, and you should know th amount of active Nitrogen, Nitrat of Soda, the gold of the fertilizer

Southern California

Written for California Cultivator

IRISES are in their glory, and this is a good month for using the pencil and making memoranda of varieties to be purchased next fall. Unortunately most of the irises are with us only a few weeks of each year, ut their wonderful beauty compenates for their culture. They may be ad in almost every conceivable color nd shade and range in size from tiny warfs to those with stalks five and ix feet high. Most of the German ype are so hardy that they may even e reset now while in bloom, and that eems to be the prevailing custom with most amateurs, to want to plant hen it is time to harvest. But if ne will be patient and, as suggested, nake memoranda of varieties to be ecured, then in October or Novemer make a planting of some of these eautiful flowers, another springtime will make recompense.

Most of the varieties may be dried off after blooming. In any case, excepting with the Japanese varieties, do not keep the soil very wet during the summer. Some, even the common royal purple, or, more correctly, the Crimson King, if given too much water during the summer will decay, but with the coming of fall abundance of water and fertilizer gives stocky growth which means big, lush flowers in the spring.

Bulbs

Daffodils, tulips, hyacinths, in fact, nearly all the spring blooming bulbs, are now dormant or becoming so. It is a good time to withhold the water and let them dry off and ripen, and by the end of the month, or certainly by the first of June, these bulbs should be taken out and put in sand in the basement.

Gladiolus may be planted for another couple of months, but this is a most excellent month for the more extensive planting for the summer bloom. Those which have been planted should be given abundance of water and fertilizer. Gladioli revel in frequent waterings.

Roses

Give the roses heavy irrigation and force to the limit for three or four months. They are benefited by free cutting of the blooms.

Annuals

The seed of many of the annuals may still be sown where one has sufficient water to grow them through the hot months. This is a good time to remember that there is usually dearth of flowers in the late summer.

Perennials

Besides annuals, there are the chrysanthemums, golden glow, golden rod, Shasta daisies and many other plants which may be divided. Golden glow should be divided and planted at once. It is but a few weeks until blossom stalks begin to start, after which it is too late to get good results with these plants.

Chrysanthemums may be divided or, still better, grown from cuttings. Root in sand or in a very sandy soil. Chrysanthemums are amongst the most wonderful of our fall bloomers. They call for attention all summer through but well repay.

The Lawn

It is perhaps a little late for the starting of a lawn in the interior valleys, but in many sections, with abundance of water and its application two or three times daily until the young plants are well established, new lawns may still be made. At least weekly waterings should be given to the old lawn and thorough and deep raking with occasional applications of fertilizer make the lawn the most beautiful of all home ground ornaments.

This is a growing month and, with plenty of water and California sunshine, will add to the beauty of every home place.

Pest Fighting

Of all the months for pest fighting this offers the greatest opportunities. The slugs are always with us. Still worse are the aphis. Then there are rose beetles and cutworms and almost every imaginable creature which deprives us of much of the garden's beauty unless combated. Tobacco dust, tobacco extract, kerosene emulsion, even strong soapsuds, will aid in control of the aphis and many other pests.

For the rose beetles, cutworms and other eaters be free with the poisons or hellebore. Arsenate may now be had in powdered form which does excellent work. It may be mixed with water and applied with a small garden spray pump or even placed dry in a coarse meshed bag and shaken over the plants.

With bugs of every kind, it is always a question of "Do it now."

Chrysanthemum Culture

Written for California Cultivator By E. Braunton

NOW is the golden time to set out chrysanthemums, though many good growers do not hurry with the planting. I do not know any flower crop that responds more readily to preparation of the soil. One cannot stir it too deeply, nor anon fertilize it too heavily. One of the most successful growers I ever knew was a woman and she dug trenches three feet deep and put six inches of raw stable manure in the bottom before refilling. The trenches were but a foot wide and the young plants were set out on a line above the middle of the trenches.

The rows were three feet apart and the plants were half that distance apart in the row. A post was driven at each end of every row, down as deep as possible. Between these posts were stretched three wires at 18, 36 and 48 inches above the soil. In case of long rows a few light posts or stakes were driven in the rows, to better support the wires. As the plants grew they were tied to the wires, not tightly, with raffia, a material much used by plant growers. Narrow strips of cloth, soft large twine or candlewick will do, but the smaller hard twines are not good as they may cut the stem unless very loosely tied.

While chrysanthemums need a rich soil they do not need fertilizing for some time after planting, nor an abundance of water. Keep them free from weeds and growing slowly but surely, never allowing them to stop and harden the growth, but yet not stimulating them to heavy growth. Only when the buds begin to show should you start to fertilize. Then begin slowly and persistently, increasing the concentrated food as the growth develops, also the water supply. When the first color shows in the buds all feeding must cease or you will burn your buds off. They will die very quickly, turning black and falling off, while the remainder of the plant will grow gayly on. Nothing but over-feeding will produce such results. It is well to keep young plants pinched back by nipping off the tender tips with the thumb nail, but no pinching or cutting back should be done after July. I have known growers to allow plants to grow as they would until July, cut them off a foot or less above the soil, and get splendid crops of fair flowers. Unless the plants have become hard and tough at the base they will at once branch out into sturdy plants. But pinching is best. Disbudding must also be promptly and fully attended to. If plants are staked singly split shakes are a good material to use.

The Jujubes

Among the valuable economic plants having a decided ornamental standing the jujubes should not be overlooked. The common species, Zizyphus jujuba, thrives in all parts of California, even on the desert, for good specimens have been received from Palm Springs in Riverside County, a district possessing a very exacting summer climate. These shrubs also thrive in all soils and with water, except on heavy clays, but will not endure stagnant water. There are large plants in Northern California now 40 years old and 25 feet high, that have borne good crops over a long term of years and still retain fine appearance as ornamentals. They merit more extensive use in all parts of the state, even in the front yards.

The Washington Palms

Lovers of palms and students of plant names may become confused in looking for our common fan palm in cyclopedias and up-to-date plant catalogues. Our common, thick-trunked

STANDARD OIL COMPANY (California)

Meeting the Universal Need

In the high passes of the mountains, accessible only to the daring pioneer and the sure-footed burro, there are telephone linemen stringing wires.

Across bays or rivers a flat-bottomed boat is used to unreel the message-bearing cables and lay them beneath the water.

Over the sand-blown, treeless desert a truck train plows its way with telephone material and supplies.

Through dense forests linemen are felling trees and cutting a swath for lines of wire-laden poles.

Vast telephone extensions are progressing simultaneously in the waste places as well as in the thickly populated communities.

These betterments are ceaseless and they are voluntary, requiring the expenditure of almost superhuman imagination, energy and large capital.

In the Bell organization, besides the army of manual toilers, there is an army of experts, including almost the entire gamut of human labors. These men, scientific and practical, are constantly inventing means for supplying the numberless new demands of the telephone using public.

AMERICAN TELEPHONE AND TELEGRAPH COMPANY
AND ASSOCIATED COMPANIES

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Turning Under Cover Crop

Have just finished irrigating walnut orchard growing cover crop. Want to work ground next week. Would you advise shallow or deep plowing, or would disking to preferable?—Santa Ana.

A green manure crop should always be well turned under and should always be well soaked by irrigation before plowing. Deep plowing is preferable to shallow plowing, but if the orchard has not been deeply plowed in other years it will be best not to disturb the permanent roots at this time of year. The ideal method of handling a green manure crop is to thoroughly irrigate the land, then use a disk harrow to cut up the green crop and mix it with the soil, and after this is done turn all under as deeply as can be done without disturbing the permanent roots too much. The disking mixes the green crop with the soil and leaves it in a condition to decay readily, which is what is needed as the crop does not become of any value as manure until well on the way to decay. If the orchard has been plowed deeply once a year and the ground is well irrigated before plowing there will be no harm done by plowing at any time. All late plowing should be followed with a disk harrow having the disks set straight, and after the disk a drag harrow should be used to further pulverize the surface and fill the cuts made by the disk. This prevents evaporation and hastens the decay of the green material.—J. B. N.

Limas After Barley

Is there any ground for the statement that limas will not make a satisfactory stand if planted after barley? My land is sandy loam and is well fertilized. The stubble will be turned under and the ground irrigated by about the middle of May. Would this stubble in the soil stand in the way of planting the limas by the middle or last of June? The barley on the land mentioned is remarkably fine.—Subscriber, Downey.

We can see no reason why the stubble ground should not be the finest for the lima beans where it is to be properly irrigated and the ground put into good condition before the planting. Stubble lands or manured lands used to be considered "poison" for crops under dry farming, this because there was not sufficient moisture to cause decay, and the straw remaining during the summer permitted more drying. If possible to plow, plow deeply and then irrigate very heavily.

One-Horse Garden Implements

A proposed five-acre truck garden for a man of limited experience offers a labor problem that will discourage any but the most husky. Can you not give me information on the most up-to-date, one-horse tools for increasing one man's efficiency? Are any one-horse riding tools made? If not, why not? Many men would undertake a good sized garden if they felt they would not be swamped by scarcity of labor.—Subscriber, Chula Vista.

There is no one-horse riding cultivator, and there hardly could be, for the traction would be altogether too heavy in properly prepared soil. It would be impossible for the horse to handle more than a one-row cultivator, and it would be impossible to arrange the wheels so that they would run without injury to the rows on either side. As to labor saving a pliances for the garden, there a hand cultivators, cultivators direct by hand with gasoline for motor pow —we have never seen this latter wo and do not know as to its efficien —one-horse cultivators, and one-hor planters. But the best place to g information is from a practical ga dener or, better still, from a visit a number of implement houses whe you can make inspection of the ne est.

Fertilizing Apricots

Have an apricot orchard of abo 750 trees, set 25 feet apart each wa About 500 of the trees are very heavi loaded with cots. Would you recom mend the use of a commercial fert lizer to increase size of fruit? If s please advise whether it should b used in furrow before or after irri tion.—Subscriber, Hemet.

First we would apply nitrogen i some quick-acting form like nitrate o soda or nitrate of lime or sulphate o ammonia, then any complete fertilize Either of the nitrogen fertilizers re ferred to at the rate of 200 or 30 pounds per acre and the complete fe tilizer at rate of 500 or possibly 80 pounds per acre.

Aphis

Please advise best means of contro of black aphis on orange trees. Wil the same spray used for the contro of black aphis prove effective with green aphis? When is the proper time to spray, and will eggs, larvae and adult aphis be destroyed with one ap plication?—Subscriber, Exeter.

Spray with tobacco extract or kero sene emulsion, which are probably the best remedies for control of this pest It may be necessary to repeat a time or two until all the aphis have disap peared.

Painting Trees

Have painted parts of trunks and limbs of orange trees having scaly bark. A neighbor tells me I will lose the trees, while another claims tha paint is an effective cure for scaly bark. Which is right?—Subscriber.

Linseed oil is not beneficial to the bark of many growing trees. The paint is often used to cover wounds where large branches are cut but the warning is usually given to prevent the paint from running down over the bark if possible. We canpot say what the result will be where you have applied it over the entire trunk but would strongly recommend that instead of paint you should use, in any future treatment, the Bordeaux paste according to formula given in the Cultivator of November 4, 1915.

Corn Ear Worm

A Yuba City inquirer wishes to know as to the formula for corn ear worm, referred to some time ago as having appeared in the Cultivator of a couple of years since. We do not have the inquirer's name on the letter which contained stamp for reply but would refer to page 485 of the issue of April 28, which describes the same method. The same subscriber referred to having an excellent method of drying sweet corn. We would be glad indeed to have this information for our subscribers.

Trees Near Line

I have a lemon grove planted 20 feet between the rows and set ten feet from the property line. My neighbor has planted a single row of eucalyptus trees about two feet from the line. The eucalyptus will destroy my first

NORWALK TIRES

Lime Your Land

Lime saves money on your fertilizer bill—and makes money by producing larger and better crops. Slaked lime produces quickest and best results. $4.25 per ton in carlots f.o.b. points between Los Angeles and Riverside. Roasted gypsum $4.50 per ton carlots f.o.b. these points.

H. B. Matthews, Fertilizer Dealer & Chemist.
350 Woodberry Rd., Pasadena, R. D. 1, Box 460.

American Nut Journal National monthly covering all phases of all kinds of Nut Culture, discussed by experts. Official Journal. Highly endorsed. $1.25 a year; 3 years $3. Sample copy 15c. 39 State St., Rochester, N. Y

row of trees and injure my pipe line. What recourse have I, and what are the laws governing the same?—Subscriber, Whittier.

There is no law touching this particular point. Plainly such a row of trees will, as subscriber intimates, cause serious injury for several feet from the line, but that injury cannot be anticipated in a court of law. After it has occurred, however, it is probable that a suit for damages would result in court giving judgment for such damages as are proved.

Jack Rabbit Pest

We farmers are urged to raise crops and I am trying to do my share, but how about the jack rabbits? Did you people at the desk ever take them in consideration? Of course I will raise beans, at least I will plant them in the ground; but there are thousands of acres idle here for a jack rabbit breeding pen. As soon as the beans appear above the ground, along comes Mr. Rabbit when I am asleep and eats them down to the ground, and there are no beans left to feed the nation with. Mr. Jack got them before the hungry people had the smell of them. Hay is scarce. I planted enough this winter to feed several cows with, intending to make milk and cream and butter to feed the people with, but Mr. Jack is getting hold of the young tender plants, already. If I don't get hay, I will go broke, and the nation will have that much less milk, cream, butter and pork. What is to be done about it?—Subscriber, Wasco.

Some day we will conserve this waste by doing as Australia does and putting these pests in tin cans and selling them as chicken or something else for the consumption of Easterners. Then we can have our rabbit drives and turn the profits of the day's fun over to war sufferers. For the time being fences or poisoning are about the only remedies. Fencing is very expensive but at this time of the year with feeds drying up, fruits poisoned with strychnine will cause the death of thousands of these pests. The entire neighborhood should unite in the campaign.

Ration for Broilers

Please give formula for fattening ration for growing chickens so they can be marketed for broilers as soon as possible.—Subscriber, Tulare.

Chicks that are intended for broilers may be fed a mash of equal parts bran, middlings, corn meal and rolled oats moistened with sour milk as early as the end of the first week. As they grow older gradually substitute ground oats for the rolled. Until they are six or eight weeks old feed the moist mash once a day, keeping a dry mash before them and giving a feeding of scratch grain at night. If milk is not available the mash may be moistened with water, a little beef scrap being added to take the place of the protein in the milk, but must be fed more carefully lest it cause bowel disturbance. At eight weeks of age, or whenever it is possible to distinguish between the sexes, separate pullets from cockerels and confine the latter in a small pen. They may now have two meals of moist mash daily, and need little, if any, hard grain. A good formula for the mash from this time on is: Two pounds corn meal, one pound middlings, one pound ground oats, eight pounds sour milk. Another good ration consists of ground oats, ground barley and middlings, equal parts. Sour milk is an important part of every fattening ration. If it is not available, about ten per cent of beef scrap or blood meal should be added. The mash should be quite soft during the fattening period, but when fed to young chicks should be just crumbly, that is, as dry as it can be made and still stick together.—J. A. K.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.
Unsigned communications receive no attention.

Ditch Right

A has a vested water privilege across the land of B, not deeded. He has not run water for four years. Now he thinks he has a right to dig out the ditch and run water without getting permission from A. Would he be liable for damage if he digs on A's land?—Subscriber, Lemoore.

Mere non-user for a period less than five years raises no presumption of an abandonment, but a cessation of use coupled with any act clearly indicative of an intention to abandon the right will have the same effect as an express release, without reference to the time. It has been held that mere non-use of a vested easement is not sufficient to defeat the right even though it be for 20 years or more. The intention to abandon or abandonment itself is required.

Buildings on Leased Land

I have leased land on which I have placed temporary buildings without any provision in the lease. Could I be prevented from removing these prior to the expiration of the term? If so, what is the provision of the law in such cases and could the landlord give written consent for the buildings to be removed at the tenant's election?—Subscriber, South Pasadena.

A tenant may remove during the continuance of his term anything affixed for the purposes of trade, manufacture, ornament, or domestic use, if the removal can be effected without injury to the premises, unless the thing has become an integral part of the premises. Articles attached to realty only by their own weight, such as would be the case with temporary buildings, are prima facie personalty and articles affixed to land in fact, although only slightly are prima facie realty. In general the presumption between landlord and tenant is that annexations by the tenant are fixtures and belong to the owner, except as first hereinabove stated. The landlord can, of course, give his written consent for the removal of the buildings, unless a subsequent mortgagee has acquired an interest in the land.

Inheritance

An unmarried man over 21 years, owning considerable property in California, has brothers, sisters, and both parents living. If he should die without a will who would inherit his property?—A Rancher.

In the above case the whole estate would go to the father and mother in equal shares.

RIVERSIDE FAIR

Believing in the old saying that "the early bird gets the worm" officials of the Riverside County Fair have started preparations for the next agricultural exhibition. The Riverside fair, which is the second largest in California, will this year be held on October 9-13. The premium lists have just been issued. A copy of this book will be mailed to anyone addressing a card to Secretary Robert L. Taber, Riverside.

The Riverside fair this year will contain many new departments. The scope of the educational work among the children will be extended. Attractive cash prizes are offered boys and girls under 20 years of age exhibiting the best samples of their school work, the best cattle, the largest pumpkin, the best formed two dozen ears of corn. For the girls alone $10 awaits the juvenile preparing the best exhibit of five jars of canned fruit.

GRAIN SORGHUMS

Continued from Page 531

and too heavily for any but the most favorable conditions.

The distance commonly allowed between the rows is three and one-half feet, since this distance provides ample room for the development of the plants and for cultivation.

The distance between the plants in the rows will be governed by the character of the soil and the supply of moisture, and also by the variety employed. On fertile loam soils abundantly supplied with moisture, the heavier rates of seeding may be employed, while on sandy soils with a limited supply of moisture it is often advisable to allow a distance of even ten to 12 inches between the plants in the rows. Again such short varieties as dwarf milo and others of the durras can ordinarily be seeded heavier than such large leafy types as the kafirs, since the individual plants do not require as much moisture or as much space for development as do the plants of the latter type. In the case of the Milos especially, it is usually advisable to seed as heavily as conditions will permit, otherwise the plants stool profusely, causing uneven development of the heads as well as uneven ripening. All of the durras and some of the kafirs, if provided with ample room, will stool to some extent, but none of them stool as prolifically as the milo.

The amount of seed ordinarily required per acre will be from two to six pounds. When planting the sorghum crop care should be exercised to see that the seed is placed below the surface mulch in contact with moist soil where it may quickly absorb the water needed for germination. This will usually be at a depth of from two to three inches. If the seed bed is rough and open, however, as is often the case on spring-plowed land, deeper planting may be advisable, though the maximum depth on ordinary soil is probably about four inches. If planted too shallow, the seed will be placed in the dry mulch, where germination will be delayed, which will often result in a poor, uneven stand.

When the surface of the soil is rough and open or the layer of dry soil so deep that it is difficult to get the seed down to moisture, good results have often been obtained by attaching shovel furrow openers on the shoes of the planters. These shovels provide small furrows by pushing the clods and dry soil aside, thus making it much easier to get the seed down to the moist soil below. This provides a condition much the same as that obtained by listing, except that the furrows are smaller and much shallower, being no deeper than necessary to get the seed below the mulch.

Listing sorghums has not been practiced to any great extent in this state, though it probably could be employed to advantage especially on light soil or for late planting. When planted with a lister the seed is planted in the bottom of a furrow several inches below the normal level of the ground. This furrow is allowed to remain open until the plants attain some size, when it is gradually filled in by the successive cultivations. When planted by this method the main roots of the plants are forced to develop several inches below the surface of the soil, making it possible to maintain a deeper mulch without injuring the roots.

On soils that are heavy or wet, however, listing may be a disadvantage since the soil in which the seed is planted may be too cold for rapid germination, or the bottom of the furrow may bake so hard that the young plants will be unable to force their way through.

Care of the Crop

The attention necessary after the crop has been planted will depend wholly upon the condition of the field and the season. The sorghums grow rather slowly at first, and it often happens that the field becomes foul with weeds before the plants are large enough to permit regular cultivation. When this occurs the weed growth may be destroyed by the use of a harrow without severe injury to the crop, provided the teeth are set at an angle of 45 degrees. Again, if the soil becomes crusted due to rains, as frequently occurs on heavy soils, the crust must be broken as the young seedlings are often too weak to push their way through. If the crust is not too thick it may be broken with a harrow, though it is usually better to use a corrugated or dunham roller, as this implement breaks the crust without injury to the plants. In general it may be said, however, that either the harrow or the roller can be employed with safety until the plants attain a height of four or five inches.

As soon as the plants are large enough so that the rows can be plainly seen the field should be cultivated, using an ordinary two-horse corn cultivator. This cultivation should be at least four inches in depth as the main object beside the destruction of weeds is the establishing of a deep mulch. For this purpose an implement with rather small shovels is to be preferred since it pulverizes the soil more thoroughly and leaves the surface relatively smooth and even. Two or three similar cultivations should be given at intervals of from two to three weeks or until the plants attain a height of about three feet, after which no further cultivation will be necessary. Normally the crop will continue growth and mature without further attention.

Irrigation

While the larger proportion of the grain sorghum crop will probably be grown without irrigation, occasions may arise under which irrigation may be advisable. Especially is this true when the sorghum is to be grown as a second crop following grain hay or similar spring crop. In such cases it will nearly always be necessary to irrigate the land before seeding.

The time of irrigating and the number of irrigations after the crop has been planted will depend wholly upon local conditions. Water should be applied when the plants appear to be affected by drouth. Except when the natural precipitation is very low one irrigation will usually be sufficient this being applied when the plants start to head.

For irrigating the sorghums the furrow method may be employed, but if the land has previously been leveled and checked flooding is usually preferred because of the smaller amount of labor involved. After irrigation the field should be cultivated as soon as the soil is dry enough to work properly.

Book Review

"THE POTATO"

"The Potato," by Arthur W. Gilbert Ph.D., professor of plant breeding New York State College of Agriculture, assisted by Mortier F. Barrus Ph.D., professor of plant pathology New York State College of Agriculture, published by the Macmillan Company, New York, $1.50.

This is one of Bailey's Rural Science Series and gives a most complete presentation of the potato from its history, description, planting and cultural methods to harvesting and even marketing. In the preface we note:

"This book is intended to give brief and practical suggestions on the growing, breeding and marketing of potatoes. It is written especially for the practical farmer and the student who may wish concise information on the potato without having to read many miscellaneous sources of information especially experiment station bulletins which, although highly valuable, are likely to contain much detail."

Again, in Chapter I:

"The potato is one of the most widely cultivated of the agricultural plants. The esculent tubers, which are developed underground on slender leafless shoots or stems, are used for food and also industrially. The plant is allied botanically to several powerful narcotics, such as tobacco, henbane and belladonna, and also to the tomato, eggplant and capsicum.

"The potato comprises about 25 per cent of the food of European and English-speaking peoples. Only the Oriental peoples exist without it. A greater weight of potatoes can be produced to a unit area than any other food crop. In potatoes we produce 161,000,000 tons, corn 128,280,000 wheat 106,000,000, oats 65,600,000, rice 55,600,000, rye 57,000,000, barley 33,410,000."

The book has 318 pages covered by 15 chapters touching upon acreage history, classification, potato breeding climate, soils, manures and fertilizers planting, care, insects and control, diseases and control measures, harvesting, marketing and storage, uses of the potato, cost of production.

How to Raise Lettuce

IN the bulletin, "Lettuce Growing in California," by Stanley S. Rogers, published by the University of California, we note that Prof. Rogers predicts great development of the lettuce industry, since so heavy a demand for California-grown lettuce is growing up that it is often difficult to supply the Eastern demand. Last year more than 2000 acres were planted to lettuce in California.

The cost per acre of growing lettuce is estimated by the university at from $75 to $100. Experienced growers under favorable conditions can produce 2000 dozen heads per acre, and at an average price of 12½ cents per dozen, this means, for skilful farmers on good land, a gross income of $250 an acre and a net income of $176.80, with the land in use for lettuce only three or four months.

Lettuce is very exacting as to soil requirements. It is best suited to a rich, light loam, and should never be planted on soils of poor quality. Irrigation is necessary throughout the entire growing period, except during the rainy season, but the crop is easily ruined by an excess of water. The crop stands cold better than heat, and in many of the interior valleys of the state it is impossible to raise lettuce of good quality during the summer.

At the time of planting, the soil should be in the finest possible condition. Many growers apply from 15 to 25 tons of manure per acre. The plants should be grown on raised beds or ridges, 12 to 18 inches wide, four to six inches high, and ten to 15 inches apart. The seed may be planted directly in the field or the grower may use seed beds, transplanting the plants when they are from two to four inches tall, the larger size being preferable during the warm weather. The best size of plant for transplanting has a top three inches tall and roots two inches long. The field should be irrigated a few times before planting and again after transplanting the plants. The water should be run between the beds and not flow over the tops, and should never be allowed to cover the plants. There should always be an adequate amount of moisture in the soil from the time the plants have commenced to head until they have matured. The hoeings necessary on raised beds will vary from one to five. The earth around the plants should not be allowed to harden.

In the interior valleys and especially in Central California, plants set in the field during September should mature during November and December; those set in the field during February, from February to April; and those transplanted during February and March, from April to June. In warm weather the lettuce should be cut early in the morning and never when the heads are wet, as in that condition they will heat and quickly rot. The field is gone over from two to five times during the cutting season. The crop is packed for shipment in crates, the crates being lined with heavy paper and iced with cracked ice, and then shipped in iced or refrigerator cars.

At the university farm vegetable garden, 80 different varieties of lettuce were grown during the past season, and most of them did well. The four varieties, however, now most in favor in California are the Los Angeles or New York Market, which is best adapted for long distance shipments and which withstands cold weather injury but is not adapted to maturing during hot weather; the Iceberg, especially adapted to maturing during hot weather; the Hansen, a desirable variety for local market; and the California Cream Butter, with outer leaves slightly spotted with inconspicuous brown spots, this variety having a rich, creamy taste.

The chief difficulties the lettuce grower meets are lack of a satisfactory stand, due to unfavorable weather, seed of poor germinating power, or to over-irrigation or under-irrigaton; or diseases, such as "stem rot", a fungus disease controllable by good drainage, and "sunburn," a blackening of the edges of the leaves inside the heads, caused by a period of excessively hot weather from the time the plants are half grown until they have commenced to head, and preventable by planting in the fall or early spring and by frequent irrigation during the spring if the weather is very hot and dry; and failure to produce solid heads, caused by poor seed, too little moisture, or excessively hot weather while the plants are maturing, and controllable by using well-selected seed, applying sufficient moisture when the heads are maturing, and harvesting immediately after the heads are matured, in case the weather is hot during the late spring.

Plant Dahlias

Alfred D. Robinson writes in California Garden regarding dahlia planting:

"Although a dahlia will grow under almost any treatment there are a few things worth remembering when planting them. As they make an immense growth in a short time they require a commensurate development underground. Provide for this by making a large hole. Unless the soil is quite crumbly it will not readily fill it under and around tubers, where these are large, and dangerous air spaces are apt to be left, especially in stiff soils, so that in these latter it is safe and sane to bed the tuber in sand or light soil. Failure to properly compact in planting is a frequent cause of the loss of plants that start to grow and then wilt and die. It ought not to be necessary to say once more that dahlias sprout from the crown and not from the tuber eye like a potato, so that a tuber broken off short with no neck is hardly worth planting, no matter how large and solid, but these can be placed in the shade on damp ground or planted with a portion projecting and used after they really sprout.

"It is not good practice to leave or plant large clumps; they should be divided into portions not exceeding three tubers. The division is best done with a large sharp knife or little saw, and the cutting should be done from the top through the crown. A good sized clump with only one old stalk can be made into three or four good divisions by cutting right through the old stalk and leaving a piece on each division.

"I hope there will be many trials of dahlias in boxes this year; pots are liable to prove too hot for the roots. Ample drainage should be provided and some charcoal incorporated with the soil to prevent souring. Rather small and compact growers should be used and considerable pinching back practiced. Possibly it would be best to sink the boxes in sawdust or coarse sand and then the growing might be done in full sun. If at all successful some wonderful decorative units would be furnished. I would use a very clean sandy loam if I could find it, expecting to provide liquid fertilizer at the blooming period. I should not imagine that this experiment offers any hope of success when tried in shade or lath houses or in the sun unless precautions are taken to keep the box cool. Think of a dahlia show of specimen plants full of bloom."

USE CARE IN GARAGE

While the hint may not be of value in California, yet on the safety-first plan it may be well for every auto owner, even in this state, to see to ventilation in his garage. The Farmers' Review remarks:

Every winter we read of several deaths from asphyxiation in garages. The trouble is that the gas from the exhaust pipe of any gasoline engine contains a varying percentage of a very deadly gas that may accumulate in a small, closed room in amount sufficient to kill. A man goes to his garage to work on the machine, shuts the room up tight because it is cold, starts the engine—and is found dead. Ventilation is the simple and sure preventive and is a precaution all should take who keep their autos or other gas engines in small, close quarters.

FEDERAL
DOUBLE CABLE BASE TIRES

Driving over rocky, rutty and uneven country roads is the hardest test you can give your tires.

The constant grind, twist and shock will soon show what they are made of.

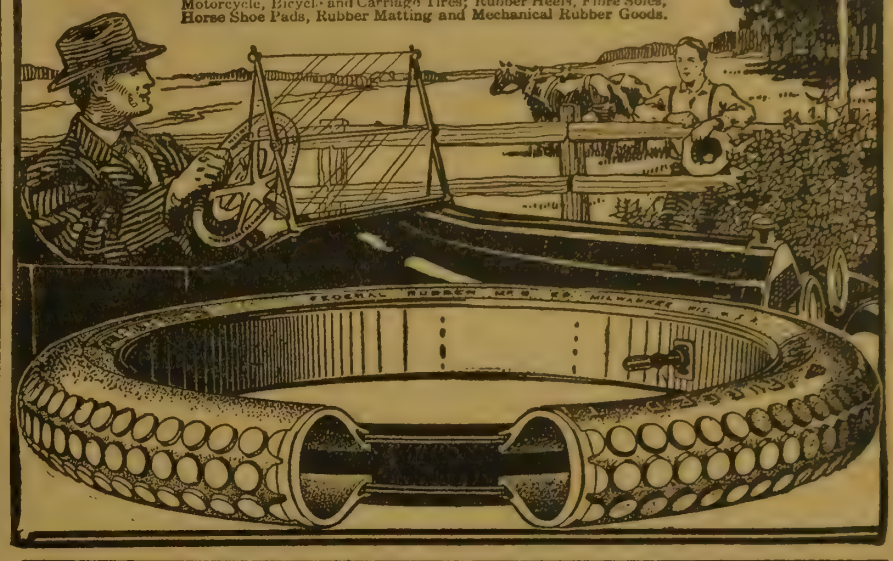
Federal Tires are built with tough treads to better withstaand this wear and tear and give best possible traction.

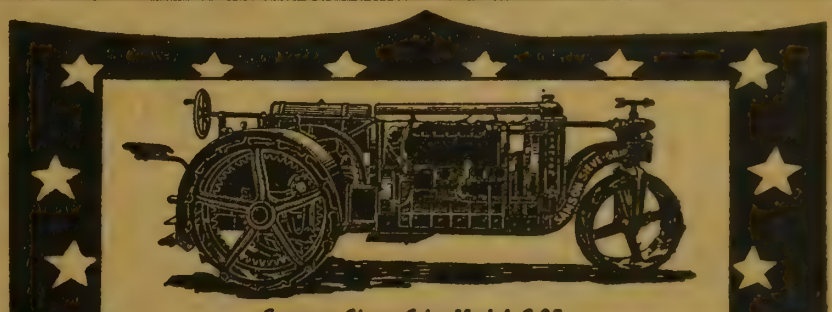
They are safe tires, too. For in the base, next to the rim, are four strong steel cables which hold the tire securely to the rim under severest strains. Yet it slips off easily when necessary.

Made in white Rugged and black Traffik non-skid treads. Sold by leading dealers everywhere.

The Federal Rubber Company
of Illinois (2)
Factories, Cudahy, Wis.

Manufacturers of Federal Automobile Tires, Tubes and Sundries; Motorcycle, Bicycle and Carriage Tires; Rubber Heels, Fibre Soles, Horse Shoe Pads, Rubber Matting and Mechanical Rubber Goods.





Samson Sieve-Grip Model S-25

READY?

Are you ready to get the best out of your farm this year?
Have you ample power for this season's work?
Do you want to get along with fewer horses and men?

SAMSON SIEVE-GRIP
Reg. and Pat. U. S. and Foreign Countries

tractors are built to help you do these things. Sturdy, simple, powerful, they can cut your farm power costs remarkably. Every farm where a Samson Sieve-Grip is working is being bettered, is producing bigger net profits.

Let us tell you more of Samson Sieve-Grips and the name of the nearest dealer. Two sizes—Models S-25 and R-12.

We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Semi-arid California has many spots by cooling streams as indicated by our cover photograph this week. It will soon be time to seek out such spots and take a moment's rest. This is a year of labor shortage and valuable moments, but rest is just as essential as in a less busy year.

FRANCIS P. SOUTH

Francis P. South, secretary and treasurer of the Kirkman Nurseries at Fresno, died last week. Mr. South was 46 years of age, and has been a factor in the building up of a great horticultural interest, and the state suffers a great loss in his passing.

ATTACKING TORRENS

The California Torrens title act is to be tested as to its constitutionality in the United States supreme court. It has been carried up by Pasadena parties on the ground that the registration sought is a violation of a portion of Section 10 of Article 1 of the constitution. The state supreme court has held that the Torrens land registration act is constitutional.

We sincerely hope it will stand before the federal court.

GET BUSY

It seems impossible for us to realize that our nation is a participant in the greatest war in history. In fact, we are altogether too indifferent, or at least it appears that we do not have full appreciation of the situation. For weeks congress has been laboring to get our country into a position where it can call an army. This is not a time to be over-critical, but it is a time when we may well urge each other to greater endeavor.

We have seen the statement that in Germany strong pressure is being brought to bear against the government to secure swifter action, and even after nearly three years, severest criticism is directed against it because it is charged that had mobilization of the German troops been hastened by only four days Paris would have been entered before the battle of the Marne, and the war ended.

If those four days could have been made so valuable to Germany, America's delay of months in getting ready to mobilize may be serious.

$'S

How much is a dollar? is an interesting question this year. We used to carry home an arm-aching load of sugar when we yielded up one of "Uncle Sam's iron men", but now we slip the dollar's worth in a side pocket and swing along home without inconvenience. It's not a comfortable feeling.

The Taxpayers' League is investigating as to how many cents there are in a dollar in a purchasing way, and it finds that its value in 1916 was only 56.6 cents as compared with 100 cents in 1900, and that its purchasing value today is only 40.3 cents compared with 1900. These are food values, but we doubt not clothing, shoes and other personal necessities are approximately on the same ratio. True, the farmer is also receiving more for his labor, but on the other hand most of the salaried workers are receiving no increase.

We are all paying the cost of submarining and other practices of war. While dollars may be increasing in number they are decreasing in size.

WHEAT SHORTAGE

More and more of good American grown wheat is going to the bottom of the Atlantic, and even without taking into consideration this destruction, the prospect of the world going somewhat hungry is becoming more serious. The statistical notes on cereals published by the International Institute of Agriculture at Rome report a deficiency in the northern hemisphere of 63,000,000 quintals, and to cover this a possible supply of about 50,000,000 quintals from the southern hemisphere. The institute says:

"We ought to add that this deficiency seems all the more serious when it is remembered that a balance of supply and requirements was only approximately attained by dealing with a remainder of 100,000,000 quintals, the result of the extraordinarily plentiful crop of 1915 and 1915-16."

Should the war end Russia and Roumania may possibly release enough to avert disaster, but in any case we are banking on right weather conditions and most rigid economy of supplies now in hand, and on substituting corn, other grains and beans so far as possible. As a rule Americans will not go hungry, but every consideration demands production to the utmost.

Coming closer home, May wheat sold in Chicago on Tuesday at three dollars per bushel, and on the same day a wire from Washington stated that there has been abandoned by the farmers of the Middle West 12,437,000 acres, of practically one-third of last fall's planting of winter wheat. This leaves still standing, 27,653,000 acres, more or less indifferent as to condition, and 7,000,000 acres short of last year's harvest. Numbers of fields will be planted to spring wheat, oats or other spring crops, and will produce some food. The department of the interior is urging appropriation of $5,000,000 to bring vacant land under irrigation projects under production this season if possible.

CONSERVE

Use more horses; save more men. The labor situation as well as the food situation is a serious one for the producer. In the feeding of animals shred the coarser fodders and induce the animals to consume every straw. Study rations, study market reports, and secure nutrients at lowest possible expenditure. Don't slaughter or market too early. Thousands of pigs from 75 to 150 pounds are going to market today at lower prices. These should be fed—if possible to secure feed—until 50 or 100 more pounds are added. This will increase the world's food products; it will increase the profits. Increase the number of animals; better, increase their quality by using only sires of highest productive power. Eliminate disease. In other words, be as careful in the sanitation about the animals' quarters as one should be about the home. Irrigate less and cultivate more. Every drop of water in this state this year should mean production of beans or of some product which will help us to feed ourselves or our stock.

Fire loss should be reduced. We have often talked of forest fire prevention, and in this respect the necessities are intensified. But not only forest fires; be sure that home and farm buildings are protected and cared for in this respect as well as possible.

Last, and perhaps most important, conserve in the home. It is worth while to call special attention to the articles which have been appearing in the household department of the California Cultivator for several weeks. They have had to do with canning and drying of fruits, vegetables, meats, in fact, every kind of food. There are other articles coming along the same line. In the shortage of cans this year how may we dry or cure fruits and vegetables and save the cans? This is answered by Prof. Cruess' article on another page and will be answered by articles to appear in later issues.

Last week the Cultivator asked on this page for suggestions from readers who had been successful in drying fruits and vegetables. This is to repeat that request. We, all of us, need all the help we can get along this line. Pass on your experience.

LABOR EXCHANGE

The California Cultivator will be glad to aid in the campaign to secure more efficient helpers on the farms. The next few months will be busy ones and some crops may be lost because of lack of help. We believe, howver, there is abundance of help if employer and employe can be brought together at the right time. The schools will soon be closed and thousands of husky young men, because of the advantage of being employed, and for the better reason—patriotism, will be glad to secure work. Mr. J. B. Lilliard of the Gardena Agricultural School has written asking how he can secure the names of farmers who may wish helpers. Will not our farmers who may later wish these helpers send their names to the Cultivator? This Gardena school is only one of hundreds. The state university is also seeking the opportunity for some of its brightest young men. While we realize that often these are not experienced farm hands they are willing and with a little patient instruction will prove most excellent helpers. Send in the names.

FRUIT CONDITIONS FAIR

Sacramento, May 12, 1917.—Reports coming to State Commissioner G. H. Hecke, from the county horticultural commissioners of the 44 most important fruit producing counties of California, results of a careful inspection and compilation, indicate a smaller crop than many had anticipated, although the increased acreage coming into bearing may overcome the shortage.

Apricots have suffered most from the enemy frost, although almonds are a close second.

Almonds

Butte, one of the greatest producers of almonds, reports a 15 per cent crop; Contra Costa, 60 per cent; Yolo, 40 per cent; Stanislaus, 100 per cent; Sutter, 65 per cent; Sacramento, 35 per cent; Solano, 10 per cent; Los Angeles, 50 per cent; Riverside, 70 per cent; San Joaquin, 100 per cent.

These counties produce 78 per cent of the entire almond crop of California.

Apricots

The following counties grow 91 per cent of the apricot output, the reports vary from 35 per cent to a full crop.

Alameda, 45 per cent; Fresno, 60; Kings, 60; Los Angeles, 45; Monterey, 80; Orange, 100; Riverside, 50; San Bernardino, 100; San Benito, 75; San Joaquin, 90; Santa Clara, 35; Santa Cruz, 85; Solano, 50; Ventura, 70; Yolo, 45 per cent.

Santa Clara produces 55 per cent of California's apricots and reports a 100 per cent crop, while Sonoma produces 12 per cent of the total, reports a 60 per cent crop. Solano, 75 per cent and Tulare 100 per cent.

Other Fruits

Peaches show a crop ranging from 30 per cent in Butte and Alameda Counties to 80 per cent in Placer and Santa Clara, and 100 per cent in San Joaquin Counties.

Plums and cherries got a pretty stiff jolt from Jack Frost, showing a percentage of 60 and 68 respectively.

Prunes were uncertain at one period but came through with an average of 91, and walnuts stand out for 94 per cent.

Averages, state wide, on the different varieties of fruits, including almonds and walnuts, are as follows:

Almonds, 58 per cent; apples, 93; apricots, 57; cherries, 68; figs, 94; lemons, 91; olives, 96; oranges, 94; peaches, 83; pears, 99; plums, 60; prunes, 91, and walnuts, 94 per cent.

BREEDERS OF HEREFORD CATTLE TO FORM AN ASSOCIATION

A meeting of all the breeders of Hereford cattle in California has been called for May 29 to June 2 at the University of California farm at Davis, for the organization of a Coast Breeders' Association. Because of the present high prices of market animals of the meat classes, there is a great revival of interest all over the Pacific Coast in better beef cattle. The California Shorthorn breeders have recently organized, and the response of the Hereford breeders to the invitation to meet during farmers' week at the university farm indicates that a strong new organization will result.

BULLETIN ON THE GARDEN

Congressman H. Z. Osborne writes that he is able to send copies of Bulletin 118, "The Small Vegetable Garden," which has a fund of valuable information for gardeners. Write to him, House of Representatives, Washington, D. C.

Agricultural News Notes of the Pacific Coast

Northern California

A railroad is assured from Hopland to Lakeport.

Yolo County is boosting for a good roads campaign.

The trout season opened May 1 with many fishermen present.

The alfalfa mill at Orland, Glenn County, is being enlarged.

Live stock men of Tehama County met at Red Bluff last Saturday.

A cheese factory has been established at Upper Lake in Lake County.

Arbuckle, Colusa County, reports no injury to almonds because of April frosts.

The rice mill at Woodland, Yolo County, is running on a 40,000-bag lot of paddy rice.

The grape crop of Sutter County is reported to have been cut about one-half by spring frosts.

Hop growers are much exercised over the continual rumors of possibility of cutting out beer manufacture.

Fig buyers are said to be keeping their eyes even on back yard trees so they may get as large a supply as possible.

Rice growers of Yolo County will be addressed by Market Commissioner Weinstock at their carnival to be held today at Madison.

Orchardists of Yolo County were given demonstrations in pruning, grafting and pollenizing at the university farm recently.

The university farm picnic at Davis last Saturday brought thousands of farmers from all sections of Central and Northern California.

The Sonoma Valley will hold a three days' celebration because of the completion of the Black Point cut-off bridge. Its cost was $90,000.

A large acreage of Butte and Glenn County lands has been exempted from the Sacramento-San Joaquin drainage district by the state legislature.

The bean crop of the Sutter Basin this year it is estimated will be double the crop of 1916. Twenty-five thousand acres are to be planted.

Farmers of Humboldt County are suffering from labor shortage. Almost every one of the younger orchards are being planted with intercrops.

The board of supervisors of Tuolumne County is joining with the government in building a good road, a lateral from the present Sonora-Mono state highway.

The Sierra Valley Cooperative Creamery at Loyalton is a complete cooperative institution, and in addition to serving members, has, as a side line, 250 hogs.

Farmers near Grass Valley are profiting because of "unwatering" of a great mining property and are giving copious spring irrigations with the water from the mine.

Hop men of Sacramento and Yolo Counties are contemplating substituting staple crops for the regular hop crops this year because of the greater demand for the former.

Peach growers of the Wyandotte and Palermo districts are reported to have sold a large part of their crop at $27 a ton. The greater part of the tonnage consists of Muirs.

At the last meeting of the California Cattlemen's Protective Association in San Francisco a resolution was adopted calling upon the government to open the national parks and forests to unlimited grazing.

Central California

Santa Clara is to have another cannery.

Kerman is to have a picnic day today, May 12.

A carload of beans has just been shipped to Havana from Ceres.

Kings County fruit planting was increased by over 300,000 acres this spring.

Great quantities of tomatoes will be grown in the section around Hanford this season.

Stanislaus County is planning for its second annual live stock show to be held this fall.

Malaga grape growers of the Kerman district are urged to form a pool of their 1917 crop.

Mountain lions are reported destroying much stock in Sargent's Canyon in Monterey County.

Twelve hundred acres in the Reedley district of Fresno County have been planted in new orchards.

Orange districts of Porterville are reported in the best condition with heavy bloom evenly distributed.

It is reported that grapes will be canned by the California Fruit Canners' Association plant at Hanford.

Hollister, San Benito County, is shipping 12 to 15 carloads of hay daily, the bulk of it bringing around $30 a ton.

The Stockton municipal free market is open every day in the week except Sunday from five a. m. to 1:30 p. m.

County Bee Inspector Henneken of Monterey County states that honey is bringing the highest price in his knowledge.

At the last meeting of the Visalia grange the discussion of crop planting and conservation of foods was very animated.

There is eight feet of snow in the Giant Forest, insuring plenty of irrigation water to Tulare farmers late into the season.

Creameries in Tulare County paid 40 cents average for March butterfat. The March payroll was the largest on record, being $118,000.

Turlock's cantaloupe crop this season is still an unknown quantity as growers are waiting to see what transportation facilities will be.

A committee has been appointed by irrigationists of Tulare County to investigate as to the construction of a dam on the Kaweah River.

Thirty to 36 inches of irrigation water a year is enough for alfalfa according to recent report issued by Irrigation Expert Frank L. Adams of Berkeley.

F. H. Wilson, president, and A. J. Sturtevant, sales manager of the Associated Raisin Company, are now in the East looking after the coming year's sales.

Trustees of the California Prune and Apricot Growers' Association announced on May 1 that since 75 per cent of the acreage had been signed up by the association its success was assured.

Former Manager and Vice President of the Associated Raisin Company James Madison was recently presented with a gold locket and expressions of good will from employes of the company.

Southern California

Large bean plantings are being made at Beaumont.

Coachella Valley farmers will ship over 700 carloads of onions.

One hundred dollars to $110 a ton for cabbage is reported from Fullerton.

Imperial Valley, it is stated, will need 10,000 laborers for the cotton and milo crops.

J. E. Ross of Alamorio recently lost 100 hives of bees by fire. A ton of honey was also burned.

Within another week it is expected that the first shipment of cantaloupes will be made from Brawley.

The Riverside Press states that 10,000 apricot trees have been planted in the Hemet Valley this year.

Water companies supplying water to Beaumont have announced a low rate for water used in garden growing.

Planting of limas has begun on the Irvine ranch in Orange County. The acreage will be approximately 18,500.

The Covina district of Los Angeles County has 4000 acres in bearing oranges and 1000 acres in young trees.

Manufacturers of cyanide announce that a plentiful supply will be available to growers in this section by June.

Apple growers of the Yucaipa Valley of San Bernardino County expect to harvest 100,000 boxes of apples this season.

The manufacture of grape sugar and syrup will take a large part of the grapes usually sold to the wineries.

Beet sugar companies announce an increase in prices for sugar beets, to be regulated by net prices received for sugar.

Captain Webster of Anacapa Island is in Ventura to secure a crew of sheep shearers for his big flocks on the island.

Covina orange growers are very seriously considering the economy of heating their orchards with cheap gas instead of oil.

Anaheim expects to begin shipping Valencias within another month. The navel season is entirely over and packing houses are closed.

Farmers in the San Jacinto district are rapidly signing up for sugar beets. It is hoped to secure 10,000 acres to assure the establishing of a factory.

The first carload of freight from Fallbrook over the rebuilt line of the Santa Fe was a carload of lemons from the Fallbrook Citrus Association.

Fullerton reports the walnut crop in the very best of condition, there being practically no signs of blight and the fruit setting uniformly over the trees.

Directors of the farm bureau of Riverside County held a formal meeting at Riverside May 5, when W. B. Parker, the newly appointed farm adviser, was present.

Manager Palmer of the Orange County Fruit Exchange estimates the Valencia crop of the southern end of Orange County at 400 carloads more than the crop of 1916.

Hemet apricot growers estimate their crop at 50 per cent of normal this season. Some portions of the valley report a full crop while in others there is practically nothing.

The Coast

The Western Washington fair will be held at Puyallup October 2-7.

Morrow County, Oregon, will hold its county fair at Heppner, September 13-15.

A new cheese factory is to be built at Harwood in Yakima County, Washington.

Grant County, Oregon, farmers report the past winter as "the worst in 40 years."

Farmers of Whitman County, Washington, plan to build six grain elevators.

The Palouse, Washington, Harvest Fair and Live Stock Show will be held October 4, 5, 6.

Elaborate preparations are being made for this year's corn show at Spokane, November 19-24.

The Farmers' Union of Heppner, Oregon, has decided to erect an $18,000 grain elevator.

Sixty thousand pounds of Oregon prunes recently went down in the Atlantic in a torpedoed ship.

A new beet sugar factory is to be erected at Independence, Oregon, by the Utah-Idaho Sugar Company.

One hundred dollars a ton for potatoes is reported from Seattle. This is to the farmers at shipping point.

At a sale of horses at the Spokane stock yards 100 horses were sold, teams averaging from $375 to $567.

The annual meeting of the Washington state grange will convene for four days at Wenatchee, beginning June 5.

The MacMinnville, Oregon, Fruit Growers' Association has elected M. F. Kenyon president, and Owen MacGill, secretary-treasurer.

The big fruit evaporating plant at the Dalles is adding $20,000 worth of new equipment, to be ready in time for the cherry season.

The cooperative cheese factory owned by farmers of Willapa Valley, Washington, was recently burned. It probably will be rebuilt.

The third annual meeting of the National Park Highway Association held its sessions in Spokane, Washington, beginning April 27.

Plowing in Okanogan County, Washington, which sometimes begins as early as March 15 was not started this year until after April 15.

The Arizona Pioneer Cow Testing Association and the Madison-Scottsdale Cow Testing Association have been reorganized for another year's work.

Live stock men from a district 100 miles about Okanogan, Washington, convened last week to discuss live stock problems. Three hundred were present.

The Valley View Farmers' Club of Oregon has decided to merge into a grangers' association and will market its products with local and state granges.

The feeding value of the mesquite bean is being urged by the New Mexico college of agriculture. Experiments have been made by the college since last fall.

Powell-Butte, in Crock County, Oregon, believes in cooperation. It has a wool growers' association, a potato growers' association, a bull association and a horse breeders' association.

GOOD Holstein Cattle Percheron Horses

If you are looking for registered Holstein cattle or registered Percheron horses of real merit, you will serve your own best interests if you are present at

Rosamond Farm Sale

Stalder Bros.

Riverside, California
Tuesday, May 22, 1917

when we will sell at public auction, to the highest bidder, absolutely without reserve or limit

60 REGISTERED HOLSTEIN COWS, HEIFERS AND BULLS.

16 REGISTERED PERCHERON MARES, STALLIONS AND COLTS.

60 GRADE HOLSTEIN AND JERSEY HEIFERS.

The Holsteins will include A.R.O. cows with official records up to 28.07 lbs. butter in 7 days; 15 daughters of a 28-lb. son of Prince Gelsche Walker, out of great dams; 20 great cows and heifers in calf to a 34-pound grandson of King of the Pontiacs; 10 splendid cows and heifers in calf to a 28-lb. son of Prince Gelsche Walker, and the dam of this sire was formerly California champion in the yearly division of the junior 2-year-old class, and she in turn is out of a former world's record cow in the yearly division.

AND SOME REAL BULLS WILL BE SOLD—The big attraction being a son of the great 34-lb. cow, Gerben Abbekerk Maid, sired by one of the best sons of Prince Gelsche Walker. By the same sire and out of dams having records of 28 and 27 pounds butter in 7 days, two other fine young bulls will be offered.

FIVE SONS OF A 34-LB. SIRE will be sold, and they are all out of good dams.

PERCHERON HORSES—The offering will consist of proven brood mares, high class young stallions, fillies that will grow into great brood mares.

GRADE HEIFERS—The 60 head of grade heifers are a good lot that look like real dairy cows, and they should please you.

Catalog now ready. Write for one.

Sale will be held on Stalder Bros.' ROSAMOND FARM, 13 miles west of Riverside, 3½ miles south of Wineville, Cal., on the date mentioned above, beginning promptly at 9 a. m. Parties arriving at Riverside by train will find free conveyance to the sale at Mission Inn Garage.

Sale under management of

The Army's Requirements in Horses and Mules

Wayne Dinsmore, Secretary Percheron Society of America

THE passage of the selective draft measure by congress makes certain the immediate preparation and equipment of an army of at least a million men in 1917. All preparations are being made for a war that will last three years, for regardless of what civilians may think, army officials do not expect an early ending to the war into which the United States has been drawn.

The requirements of cavalry, infantry and artillery regiments in horses and mules are set forth in a letter just received by the writer from the war department, Washington, D. C., to be as follows:

Cavalry Regiment.—1541 horses, 152 draft mules, 29 pack mules, 6 riding mules.

Infantry Regiment. — 69 riding horses, 112 draft mules, 25 pack mules, 6 riding mules.

Artillery Regiment.—1097 horses, 88 draft mules, 4 riding mules.

These are minimum requirements and do not take into account transportation trains required to forward supplies from terminal points to field bases. In other words, the number of animals specified above refers only to those actually needed with the troops.

The war strength of a regiment of infantry is approximately 1500 men; of a regiment of cavalry approximately 1300 men; of a regiment of artillery consisting of six batteries of four guns each, approximately 1146 men. While definite information as to the proportion of infantry, cavalry, and artillery to be included in the new army is not yet forthcoming, it is generally understood among army officials that an artillery battery of four guns will be allowed for each 1000 infantry. It seems probable therefore that the first million men placed under arms by the United States will be composed of 500 regiments of infantry totaling 750,000 men, 125 regiments of artillery totaling 143,250 men, and 100 regiments of cavalry totaling 130,000 men, making a grand total of a little over 1,000,000 men. The proportion of artillery certainly will not be less, and may be more, as actual warfare on European battlefields has demonstrated that overwhelming superiority in the artillery branch of the service is essential to efficient operation by the infantry.

It may be argued that there is no probability that the United States will prepare 100 regiments of cavalry, but in view of the danger from the Mexican situation, it appears to be the belief of well informed army officers that at least that many cavalry regiments will be provided for in this year's mobilization.

To equip 500 regiments of infantry will require 34,500 riding horses, 56,000 draft mules, 12,500 pack mules, and 3000 riding mules. One hundred and twenty-five regiments of artillery will require 137,025 horses, 10,000 draft mules, and 500 riding mules. The equipment of 100 regiments of cavalry will necessitate 154,100 horses, 15,200 draft mules, 2900 pack mules, and 600 riding mules. The total number therefore required for the equipment of 500 regiments of infantry, 125 of artillery, and 100 of cavalry, will amount to 325,625 horses and 100,700 mules.

The army has at present only 70,000 head of horses and mules. This means that approximately 350,000 head of horses and mules must be bought within the next six months. No information has yet been received from the army authorities in regard to how the purchase of these horses and mules will be made. In the judgment of experienced horsemen, however, the purchase of so large a number of horses and mules within the limited time available can best be accomplished by setting a definite price to be paid by the army for the different animals that will pass inspection for their respective classes, and by establishing ten or 15 inspection points where horses and mules may be tendered for inspection. This will permit dealers, large or small, or even farmers, to consign their horses directly to inspection points with definite information in regard to what they will obtain for them if they pass inspection. There seems to be no good reason why the producers of horses should not be permitted to sell them directly to the government, if they pass inspection, instead of being obliged to sell them through some intervening contractor. It is earnestly to be hoped that the army officials will decide on some general plan.

It must not be forgotten that the allied nations are still in the market, and will continue to be. Their need for horses and mules is as great as for guns and ammunition; indeed, even more so, because they can manufacture the guns and ammunition in their own countries, but their resources in horses and mules have already been exhausted, and the United States is the only source from which they can obtain additional supplies. 853,116 head of horses and 289,062 head of mules have been exported, practically all of them for war purposes, during the 30 months ending March 1, 1917. In spite of the shortage of ships, 40,000 head of horses and mules were shipped in January, 1917, and more than 27,000 head in February, 1917.

Recent accounts from the battle-front relating the loss of hundreds of pieces of artillery by the Germans in recent operations state that the loss of these pieces was due recently to the lack of artillery horses.

It is fortunate that the United States is well supplied with both horses and mules at the present time, but it is incumbent upon us, if we are to maintain our resources so as to effectually back up our armies and maintain maximum production on our farms, to see that every good mare is bred to a first class stallion this season, and that every effort is made to save the foals that will be coming within the next six weeks. The war may yet be decided by the number of horses available to the respective belligerents, for on the far-flung battle lines and in the reserve made up of our farm forces, the horse is the most important single factor aside from man.

Northern California Live Stock Notes

Written for California Cultivator By W. S. Guilford

BARNYARD SUGGESTIONS

NOW is a good time to be thinking about the mud that was knee deep in many barnyards last winter. A few loads of gravel hauled now may prevent a great deal of misery and loss of condition and waste of feed among the animal population of the farm.

In some cases it will pay to make a concrete platform in one corner of the barnyard, in a place where a fence can be put around it. When the heavy rains come, the stock can be kept closely penned in this concrete floored yard and can be fed there. "But what about exercise?"

The periods of bad weather are not generally of long duration in California, and by keeping stock off the earth yards and fields these will dry off more quickly than if they are tramped and puddled, so that all the exercise that would be missed would be that which the animals would be compelled to take in kneedeep or belly deep mud, and the case would be a rare one where stock would not be better off out of the mud without exercise for a few days than in the mud with it.

And right now is a good time to attend to this matter.

"GOOD STOCK HAY"

It may have been allowed to get pretty ripe and dry before it was cut,

and then after cutting it may have been put into small bunches and left for weeks or even months until it is bleached out and dried from top to bottom. It will then have become worthless to bale and sell as hay to ship, yet some one will say, "Well, it's good stock hay."

This is because stock will eat it rather than starve. But what a waste of the natural resources of a country to treat hay in that way.

This is one case where nature is too good in California. If this hay was in the corn belt the rains would compel the owner to take care of it in better shape or it would rot. Here there is no such compulsion, so instead of stacking it or putting it in big bunches, it is allowed to weather from May until October. Every year hay that has been cut in May is ruined by the fall rains.

It is easy to abuse a "good thing"—and our long dry summer certainly is good for many farming operations.

Keep Out Tuberculosis

THE department of agriculture is mailing large hangers to live stock sections with big type heading, "Keep Tuberculosis Out of Your Swine." After referring to the great loss incurred because of certain packing houses and buyers determining to avoid districts where tuberculosis is common, or else insisting upon buying hogs subject to post mortem examination with the loss falling on the producer, it gives the following regarding prevention:

"Raw milk from a tuberculous cow will sooner or later certainly carry the germs of tuberculosis to your hogs A little care will prevent this.

"Scald all skimmed milk, buttermilk, or whey. Even boiling will not lessen their feeding value. Either scalding, boiling or pasteurizing—that is, heating to 145 degrees Fahrenheit and holding at that temperature for 30 minutes—will kill all germs of tuberculosis and also render harmless stray germs of many other animal diseases. No farmer, unless his herd is tuberculin tested and free from tuberculosis, should feed his skimmed milk raw to his swine. He is taking an unnecessary risk of having them rejected at the slaughter house.

"Raw skimmed milk and buttermilk from creameries and whey from cheese factories are particularly dangerous. If there happens to be only one tuberculous herd on the creamery route, the skimmed milk from that farm may spread tubercle bacilli through all the milk in the skimmed milk tank. Cook all raw milk taken home from the creamery. Better yet, join with your neighbors in insisting that the creamery shall pasteurize skimmed milk before it is delivered. Such pasteurization prevents the creamery from becoming a distributing point for animal diseases, the germs of which get into milk. If your creamery delivers pasteurized skimmed milk, see that your own cans are sterilized before you take your share. The little raw milk left in your own cans may contaminate the pasteurized milk furnished by the creamery.

"Raw garbage, raw slaughter house offal, the raw flesh of dead chickens, or other carrion also are very liable to contain germs of tuberculosis that will infect your hogs. Cook all raw garbage or meat before you give it to your animals. Garbage so prepared is excellent food for hogs, provided it is not decomposed before it is cooked. Keep garbage containers clean, and construct piggeries where sterilized garbage is prepared and fed, so that they may be cleaned readily. Prepared tankage from slaughter houses is free from danger, as its preparation involves thorough cooking or sterilization.

"The dropping of tuberculous cows, especially of those in which the disease is of long standing, are almost certain to contain large numbers of tubercle bacilli.

"Hogs having access to manure or bedding from such cows are almost certain to get the disease. The safest plan is to keep your hogs absolutely away from your dairy cattle unless your herd has been tuberculin tested and is known to be free from tuberculosis. The risk more than offsets any feeding advantage.

"In the case of steers or other cattle known as 'feeders,' it is comparatively safe to allow hogs to follow, them, as the disease is not very common among these animals, and they usually are sold off the farm before the disease, if contracted, develops to a point where their droppings would be infected."

Field Notes From the Live Stock Men

D. F. Conant reports sale of a bull to Geo. Scott.

N. H. Locke reports sales of a bull to W. F. Smith of Cottonwood.

Guy Miller has recently sold bulls to J. H. Holgate and F. E. Robinson.

W. J. Hackett has sold a bull to J. R. Widict and a cow to D. Hackett.

C. D. Hayworth reports sales of bulls to S. Montgomery, O. R. McGee and Henry Knightland and to Robert Rupp.

All cows in the N. H. Locke herd are being tested. Among others worthy of note are La Valets Adelaide of L. Her sire is Kings Valet and she is out of Golden Adelaide Smith. She started on test as a yearling weighing less than 600 pounds, making a yearly record of 8122 pounds of milk and 370.2 pounds butterfat. In May, 1916, she produced 816 pounds of milk, which was over 216 pounds above her own weight. Golden Leader is a daughter of Kings Valet and Stockwell's Cousin Imp. She was first prize calf, yearling, two-year-old, three-year-old and grand champion at the California state fair. She has produced 433.7 pounds fat in a year.

Golden Leona of L., a two-year-old daughter of Kings Valet and Golden Lemola of L., has, starting as a yearling, made a record of 6356 pounds of 5.1 test and 323.5 pounds of fat in a year. She took second prize in her class at the P. P. I. E. Her first month's record as a two-year-old was 45.1 pounds fat and 878 pounds milk with a 5.2 test.

Kings Leader, another daughter of Kings Valet and Golden Leader, as a two-year-old has produced 6796 pounds with an average test of 5.2. The fat for same time (one year) was 355.6 pounds. This cow also took second prize in class at P. P. I. E.

The ten highest producing cows in the Locke herd, two two-year-olds, four three-year-olds, four four-year-olds, made an average production for March of 52.99 pounds of butterfat.

Book Review

"DAIRY CATTLE FEEDING AND MANAGEMENT

"Dairy Cattle Feeding and Management," by Carl W. Larson, M.S.A., Ph.D., formerly professor of dairy husbandry, Pennsylvania State College, and Fred S. Putney, M.S., professor of experimental dairy husbandry, Pennsylvania State College, published by John Wiley & Sons, New York.

"The book is written for students of dairy cattle feeding and management. It is the outgrowth of several years of experience in teaching this subject. The authors believe that the lecture system alone does not give the greatest efficiency in teaching. A broader field will be covered and more accurate information will be gained by the student if the lecture is combined with a text book. This volume is therefore prepared to meet that need."

It is a book of 472 large pages with many half tone illustrations and pen drawings, and while it is to an extent a text book it gives a fund of valuable information to the practical dairyman. There are 29 chapters and an appendix. These 29 chapters touch upon the relation of dairying to agriculture, the principles of nutrition of dairy cows, feeding standards, methods of balancing, selection of feeds, systems of herd feeding, silage, silos, soiling systems and pastures, raising the dairy calf, care and development of the dairy heifer, feeding and care of the sire, principles of dairy cattle breeding, se-

Santa Anita Rancho

Anoakia Breeding Farm

ARABIAN-THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Iba Mahrusa, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Iba Mahrusa, world renowned imported desert saddle stallion, and Don Cartano, a five-gaited Kentucky saddle Stallion. These horses are mostly three-year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars, Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 8th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

The Quality Holstein Sale

100 Registered COWS, HEIFERS, BULLS **100**

State Fair Grounds
Sacramento, California
THURSDAY MAY 31, 1917

The offering consists of carefully selected consignments from the following high class herds:

Bridgford Company, Knightsen Toyon Farm, Los Altos
J. S. Gibson Company, Williams Frank Hatch, Modesto
Henderson Company, Sacramento
Palo Alto Stock Farm, Palo Alto

This is essentially a sale of high class foundation stock, good individuals, splendid blood lines. There will be sold an unusually high percentage of heifers, both bred and open, the kind that have their whole useful lives before them and that grow into money fast. Those in calf are bred to some of the greatest sires in California today.

Bulls of outstanding breeding and individuality will be sold. The breeder in need of a sire with real herd heading breeding and quality will find him in this sale.

THE OFFERING OF FEMALES WILL INCLUDE:

A DAUGHTER OF SPRING FARM PONTIAC CORNUCOPIA, son of the first 44-lb. cow. The dam of this heifer, at just past 5 years of age, made a record of 31.70 lbs. butter in 7 days, shortly after being shipped from the East to California. The first four dams of this heifer average 84.41 lbs. butter in 7 days, and she is eligible for prizes of $100 for a 20-lb. 2-year-old with first calf, and $200 for a 30-lb. record at any age, offered by the owner of her sire.

A DAUGHTER OF KING KORNDYKE SADIE VALE, the only 40-lb. sire that has sired a 40-lb. daughter. Her dam is a good granddaughter of Pontiac Korndyke and De Kol 2nd's Butter Boy 3d.

A DAUGHTER OF KING SEGIS PONTIAC, out of a granddaughter of Hengerveld De Kol.

A 20-LB. DAUGHTER OF MILK AND BUTTER PRINCE, out of a daughter of De Kol Admiral Paul.

AN 18.60-LB. JR. 2-YEAR-OLD DAUGHTER OF DUTCHLAND COLANTHA BELLE BOY, in calf to King Pontiac Segis Korndyke.

A DAUGHTER OF SIR SKYLARK ORMSBY HENGERVELD, sire of the great 34-lb. cow Gerben Abbekerk Maid and the 31-lb. 4-year-old, Cristeria Overton Mechthilde 4th.

A DAUGHTER OF FINDERNE HENGERVELD KORNDYKE, out of a good dam.

A SPLENDID YOUNG A.R.O. COW out of a 27-lb. daughter of King Mead of Riverside, sire of Aaggie Acme of Riverside 2nd, the 35-lb. California champion cow.

A 20-LB. COW that has a semi-official record of over 15,000 lbs. milk and 644 lbs. butter in 320 days.

A GREAT COW with semi-official records of over 19,000 lbs. milk and over 800 lbs. butter in one year, heavy in calf to King Segis Alcartra Abbekerk, a 30-lb. son of the $50,000 bull, King Segis Pontiac Alcartra.

AND MANY OTHER high record cows, daughters of high record cows, and cows and heifers in calf to great sires.

THE OFFERING OF BULLS WILL INCLUDE:

A SON OF A GREAT 33-LB. COW, sired by a grandson of King Segis De Kol Korndyke.

A SON OF FINDERNE PRIDE FAYNE, whose sire is half brother to the world's only 50-lb. cow, and whose dam is the former world's record cow, Finderne Pride Johanna Rue. The dam of this great young fellow made an official record of 19.16 lbs. butter in 7 days as a yearling, and she is out of Valdessa Scott 2nd, the first 40-lb. cow. The dam's sire is King Pontiac Segis Korndyke, son of King Segis De Kol Korndyke and a 30-lb. cow. The dam is a great individual, and a candidate for a very large record.

A GRANDSON OF TILLY ALCARTRA out of a 28-lb. daughter of Johanna McKinley Segis.

A SON OF JUDGE LYONS, son of King Lyons and a daughter of King Walker. The dam of this royally bred youngster is a 21-lb. 2-year-old daughter of King of the Black and Whites and Lillian Walker Spofford, who has made five official records above 30 lbs. butter in seven days.

A SON OF JUDGE LYONS out of a 24-lb. junior 3-year-old of splendid breeding.

A SON OF PRINCE GELSCHE WALKER out of a 25-pound 4-year-old daughter of Beryl Wayne Korndyke of Riverside, and she also has semi-official records above 18,000 lbs. milk and above 800 lbs. butter in one year.

Spray - Dip - Disinfect

When you see those words what sort of a product do you think of? Probably a dirty, vile-smelling, oily coal-tar or dangerous carbolic acid.

Then you will quickly see the remarkable advantage of using B-K, the POWERFUL disinfectant with ten times the germ-killing strength of undiluted carbolic acid, as B-K is not a poison—contains no acid to sting, or dangerous drugs to poison—no oil to gather filth on stock. B-K is clear and clean as water, and as easy to use. You should use B-K regularly for spraying barns and stock—hog pens and poultry houses—for dipping the birds and stock as well as for mixing in the drinking water. If your dealer does not have B-K, send us his name. Dealers wanted in every town.

Awarded Gold Medal Pan.-Pac. Exposition.

FREE BULLETINS—Send for complete information—"trial offer" and bulletins on Farm Disinfecting—Contagious Abortion—Calf Scours, Hog Sanitation or Poultry Raising.

lection of the sire, dairy herd development and management, production of high grade milk, common diseases of dairy animals, methods of keeping herd records, cooperative cow testing, dairy barns, equipment, marketing milk, advanced registry feeding and management, milk production, cash accounts, fitting animals for show. The appendix is devoted to a table of dry matter and digestive values of various feeds, amount of different feeds required to equal one feed unit, and other valuable material. The index is very complete.

The Carruthers Shorthorn Sale

Written for California Cultivator By M. C. Holman, Manager of the San Francisco Office

HAVING established himself as the inaugurator of the first Berkshire sale at a private breeding farm in California, Mr. Carruthers further added to his laurels on the second of May by holding the first sale of Shorthorns ever held in the state. The day was ideal—just the kind for good display and good buying, and everyone who has attended auction sales of live stock knows that it is desirable to have favorable weather conditions in order to carry off a good sale to the credit of the animals and the auctioneer.

At the Carruthers Sale

At the left standing in the box is Prof. Van Norman, making speech at opening of the sale. The other picture shows Auctioneer Jones making first sale.

With the coming of the first train from San Francisco the vanguard of the buyers began to arrive, and with each succeeding train, both from the north and the south, the number was heavily increased until the hour of the sale saw an immense crowd in anticipation of the afternoon's events. With book in hand the buyers had canvassed the situation, making notes upon the animals they considered bidding on, and when the sale opened one hour late the buyers were fully alive to the merits of the various animals.

Colonel Carey M. Jones, the auctioneer, opened the sale with a brief address in which he touched upon the desirability of raising pure bred cattle and of the particular aptitude of the Shorthorn for furnishing the juicy steaks that command such exceedingly good prices at this time and which will command good prices for many years to come. Desiring to have a talk from one who is particularly familiar with the local situation Mr. Jones presented Dean Van Norman, of the state farm at Davis. The dean urged the raising of all the cattle we possibly can and assured the prospective buyers that there is a big demand for pure bred cattle. He called attention to the excellent qualities of the stock about to be offered and earnestly recommended that fair prices be paid for them. He also recommended that breeding animals be not disposed of, but that they be kept to the full time of their usefulness, that we may have more of the better grade of cattle. He invited attention to the wonderful opportunities which are before the breeder of pure bred cattle and stated that it was his belief that favorable conditions would prevail for many years. The dean was especially optimistic in his outlook upon the possibilities of the cattle business in California. Added force was given to the speech making by the presence of Count Glory, the massive Shorthorn at the head of the great Carruthers herd.

By way of introduction a beautiful white cow, White Briar, and her calf were brought into the ring. Previous knowledge of the Shorthorn was not necessary in order to recognize that these two animals would be well up in the money. "How much for this cow and calf?" called out the auctioneer. Quick as a flash came the reply from T. T. Miller, of Los Angeles. "I bid $1000." There was a moment of silence, for the crowd realized that some big money was going up for the pair. The bid was raised to $1100, and they were not disappointed, for Mr. Dibblee of San Francisco ran the bidding up to $725 for Rookwood Ury, sired by Count Avon, and he followed this up with Mayflower at $750, sired by the great Sultan Mayflower. Another purchase by Mr. Dibblee was Ruby Queen and calf, which he secured for $900.

The loss of a horn having incapacitated one of the cows for the sale, a particularly choice cow, Golden Queen, was substituted. The bidding

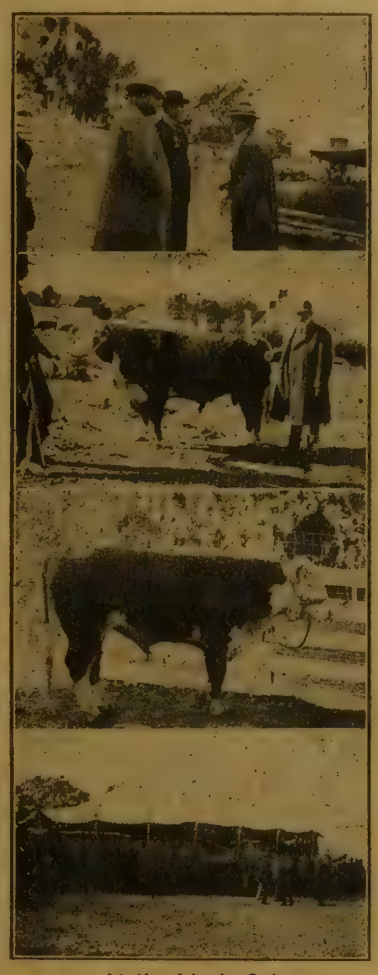
Hereford Sale at the Lively Stock Farm

Written for California Cultivator By M. C. Holman of the Northern Office

COMING so swiftly upon the heels of the successful Carruthers sale, one would scarcely think that a second auction of beef cattle could be held in the same town in the same week. But all precedent and conjecture were swept aside, for there was an even greater crowd at this second sale.

That there is a big demand for beef cattle cannot be denied. The stock raisers are coming to know that it is



At the Lively Sale

Messrs. T. S. Glide, Harris Weinstock and F. G. Smith in the top picture are discussing the sale; the next below is Mr. Newhall and his prize bull; next to the bottom a $750 youngster, Panama 33rd. At the bottom, the sale tent at time of one of largest sales.

beef that is wanted, and they have set out to produce it. The best that can be found is readily purchased and at prices which mean much for the pure bred industry of the state.

At the Lively sale we had a special opportunity of seeing the working of a celebrated eastern auctioneer, and the palm for excellent handling of cattle in every detail of management must be given to Colonel Fred Reppert. He was master of the situation and his wonderful sallies of wit and humor, coupled with forceful logic upon the fundamental necessity for the purchase of good live stock brought in the money in splendid bunches.

The Hereford cow and bull are to be greatly admired and they came in for a good average at this sale. Their rustling qualities, meat producing abilities and general bearing are such as command the best prices. They are breeders of particular excellence. With white face, broad forehead, short neck, and even, well filled frame the Hereford is a picture one may stand and admire.

In his introductory remarks Colonel Reppert told of these animals in their Montana home, and of the good prices they had brought where former sales had been held. Ex-Governor Porter noted the particular significance of having a sale of Herefords in California. He declared that it meant the bringing of some of the best animals of the breed into the state and the opportunity of diffusing that high grade through the herds of California, thus rendering them greater in flesh and of more money value for the same amount of feed and the same amount of care. One could not fail to realize the truth of these statements when the ages were known and the size and condition of the animals were seen.

The cattle that were sold at this sale would have brought from $300 to $1400 in the East. But this was a missionary sale, just a feeler, as it were, to test the buying power and willingness of the California breeders. It is to be remarked that in the missionary days in the East it was not possible to secure the prices that were paid at this sale. We are starting in California with payments much larger than the East started with and with improvements coming continually we may be expected to show a willingness to pay even higher prices, whether the animals are eastern or western.

It was a rather remarkable fact that at both sales the best of the offerings were taken by men from the south. Mr. Newhall of Los Angeles purchased a magnificent bull, Satin, for $900. This was considered a good price, but the animal is well up in prize money and will make for Mr. Newhall an enviable reputation, whether in the show ring or as a breeder. The cows held well in the buying, but the bulls topped above any figure that was expected. There were bull buyers at the prices necessary to get the best of the sale and they were willing to pay the offerings. And while Mr. Newhall secured what was likely the best purchase there were a number of other bulls that brought figures from $500 to $750.

Continued on Page 547

Some of Those Present

A. B. Cook, man with stick, one of consignors. Next picture below in the center is Mr. Nickoll. At the bottom is Col. Reppert, the auctioneer, and his secretary.

CUTTER'S BLACKLEG PILLS

"California's Favorite" for nearly 20 years

For the Prevention of Blackleg in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest.

Prices:
10 dose pkge. Single pills $1.00
50 dose pkge. Single pills 4.00
10 dose pkge. Double Pills 1.50
50 dose pkge. Double Pills 6.00
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

BEE SUPPLIES

For Sale—175 to 250 colonies Italian bees with extra equipment; in eight-frame hives; can remain in present location if desired. Geo. A. Sill, Watsonville, Cal.

HEREFORD SALE

Continued from Page 545

In the cows there was no outstanding supremacy, many of them bringing from $500 to $800. A thousand dollars was not reached, not that the cows were not worth the money, but there was not the strong bidding for the females that was shown for the bulls.

A large portion of the animals were purchased by California breeders. The diffusion of that blooded stock means that the ranches of California are to be presented with sires and dams that are sure to bring credit to the state, whenever shown, either east or west.

The excellence of their general form, the well rounded body, the bearing, the dignity of poise, the capabilities, both present and potential, are such that one cannot but realize that a great advance has been made in our local live stock industry.

In many instances the cows were with calf at foot and due to calve again again within a reasonably short time. That one purchase will, in itself, make a foundation herd that will make thousands of dollars for the owners. When we consider that the product of a good cow will often sell for her own price when very young, we can readily see the decided advantage of purchasing high grade cows. There is the prospect of many calves all ranging well up in money. When we can feed such animals with but little trouble and expense it gives the live stock business a vast outlook.

As a missionary propaganda the sale can only be accounted excellent and while some of the cattle did not bring all that was expected, the general average was particularly good. It should give courage to other breeders in the east and west to present to the buyers their offerings, and we feel confident that as good prices as were paid at this sale can be realized again for equally good stock.

The averages at the D. O. Lively Stock Farm sale was as follows: 15 bulls averaged $433; 29 cows averaged $329; general average $373.

CARRUTHERS SHORTHORN SALE

Continued from Page 544

started on her at $300. It was quickly run up to $700, and then by slower stages of cautious bidding she was knocked down to Mr. Miller for $1000. Mr. Miller made the two highest purchases at the sale and carried away three of the best cows that were ever put up at auction.

The prices of the cows ranged from $250 to $700 aside from those already mentioned as top notchers. But the bulls did not fare so well, one of them, Lord Wilson, going to Mr. Marshall of Los Angeles for $100. That is a cheaper price than the same amount of cow flesh would have brought on the hoof from the butcher, and the low prices obtained for the bulls brought down the high average established by the cows to the mean average of $370 for the entire sale.

It is quite possible that the low prices paid for the bulls was due to the fact that at this time they cannot well be used as breeders, but must be carried over for another season, and with feed at the present market one is likely to think that it would be better to wait till the animals are needed before paying their season's board. The bulls were of good breeding, of registered pedigree, strong of frame, sturdy of legs, well set, low to the ground, with good loins and heart girth. They will establish names for themselves when their time comes to head some of the herds of California and the Pacific Coast, for a number of the purchases were for Oregon.

In a number of instances the bidding was started particularly low, one bidder refusing to make the first bid more than $200. While we have no desire to make our readers believe that we would have any one pay more for a thing than it is worth, we would call attention to the fact that each low purchase decreases the value of similar animals all over the state, for an auction sale is largely a value placed upon certain classes of animals, no matter where found. The man who secures a bull for $100 or $200 cheapens all of his bulls at home, and while he makes a saving of perhaps $200 on the purchase, he loses several times $200, depending upon the number of bulls he owns. On the other hand, paying for an animal what he is worth, with perhaps a little thrown in for good measure, boosts the breed just that much, and while the cow or bull that is purchased may cost a good figure, the added value placed upon similar animals of one's own breed greatly overweighs the additional money paid.

Mr. Carruthers was fairly well pleased with the sale and has expressed himself as being desirous of further improving what he considers the greatest breed in America.

The following is a list of the purchases, with the amounts paid and the names and addresses of the buyers:

White Briar and calf, $2000; Golden Queen, $1000; Lady Dorothea 10th, $550; Riverside Grace 4th, $300; Mayfield Lil, $300; to T. T. Miller.

Rookwood Ury, $725; Mayflower, $750; Orange Blossom Girl, $350; Young Blossom and calf, $435; Lucy Lee, $400; Ruby Queen and calf, $900; Pacific Sultan, $225; Mayfield Sultan, $310; to Thos. B. Dibble Estate.

Magnolia, $250; Henrietta, $220; Orange Mary and calf, $375; Mayfield Henrietta, $205; to Barco Ranch.

Lucretia, $375; to C. N. Hawkins & Son.

Mary Fair, $285; Gloster Miss 2nd, $220; to J. F. Dunn.

Twinkling Star and calf, $225; Lady Foxglove 4th, $250; Dean Sultan, $140; Pacific Mayflower, $140; to Harry Murphy.

Mayfield Knight 2nd., $280; Mayfield Knight 3rd., $280; to O'Connell Bros.

Lord Valentine 2nd, $225; to R. C. Burton.

Ormondale Victory 2nd, $315; to Elder Creek Ranch.

BIG HOLSTEIN MEETING AT NAPA

Written for California Cultivator By C. L. Hughes

AN assemblage larger than ever attended a breed association meeting in California gathered at Napa State Hospital on Saturday, May 5, to participate in the meeting of the California Holstein-Friesian Association. President Fred W. Kiesel of Sacramento had put forth special effort to notify every Holstein breeder in the state of this meeting, and those who did not attend missed a rare treat.

The association on this occasion was the guest of the board of managers and Mr. Owen Duffy, business manager of Napa State Hospital, and the hosts left nothing undone to add to the comfort and enjoyment of their guests. A fine lunch was spread in the great hospital dairy barn, which proved to be a dining room that would compare in cleanliness, light, ventilation, and "invitingness" with most of the places where they charge extra for bread and butter. About 150 guests seated themselves at the big tables at one o'clock, and it was well along in the afternoon, and the sleek, clean Holstein cows were in the same barn eating their lunch of sweet ensilage and grain, before the meeting came to a close. During the lunch the hospital orchestra, an exceptionally good musical organization, added a full measure of good music to the general enjoyment.

Following the lunch, President Fred W. Kiesel presided over the meeting in the happy manner that has already made him a popular president. Some of the speakers programmed to be present were among those absent, but a wealth of after dinner speakers were recruited from among the visitors. Emmett Phillips, president of the board of managers, welcomed the association, and impressed his hearers with the great work that is being done by the big hospital. State Controller John S. Chambers, gave some interesting thoughts on the subject of the "State's Interest in Industry". John Neylan, president of the state board of control, was one of the recruit orators, but his talk on the handling of the state's finances was one of the hits of the day.

The fellow who invented the phrase "A prophet is not without honor except in his own country" evidently didn't live long enough to meet Owen Duffy. The speakers of the day, high state officials who have worked with him, neighbors and leading citizens of Napa County who have worked with him and have observed his work, unitedly and severally heaped upon him a measure of praise for the agricultural development of the Napa State Hospital properties that might well have been dangerous to a man less modest than he is well known to be.

CHRYSANTHEMUM CULTURE

Continued from Page 535

California fan palm is properly Washingtonia filifera, variety robusta, and has been known to the trade only as W. filifera. The tall slender species, known to nurserymen as W. robusta (doubtless for the reason that it is less robust than the other) is very properly W. gracilis, as all who know it well will agree. It is well for those about to buy these palms to be able to recognize them under either or both names or some confusion and disappointment may result.

Improved Day Lilies

The old-fashioned day lily, Hemerocallis fulva, with its large flowers of weak yellow is no doubt known to all, but the improved sorts, hybrids by the way, are not so well known. Sir Michael is the lightest in color, a soft, buff-yellow. Baroni has yellow-orange flowers and is very fragrant. Dr. Regel has very large orange flowers, and queen of May, the tallest of all the lot, has the darkest flowers, a deep orange, and the most floriferous of the hybrid sorts. There are other named varieties, and all are superior to the old type.

The Sapodilla

Another good evergreen fruit tree for the front yard in the most favored parts of California is Achras sapota, the sapodilla of the American tropics. The tree is slow of growth, even where frosts are unknown, and should be planted in California only where lemon trees pass unharmed through the winters. Even then the growth is confined to the hottest months, and some years will elapse before fruiting takes place. As the tree is of good appearance and evergreen one may forget for the time that it ever fruits, and consider ornamental only.

We have been very conservative in our advertisements of the sale at public auction of

Willowwood Herd

60 REGISTERED JERSEYS 60

Owned by C. G. McFarland

Tulare, California

THURSDAY May, 17 1917

As you will immediately feel when you see this great herd on sale day.

And we repeat that it is entirely conservative to state that this is the very greatest offering of well bred, well built, well developed Register of Merit Jersey cows and their offspring ever led into a Western sales ring.

A Get-together Meeting

On the evening of Wednesday, May 16, at 8 o'clock, a good fellowship meeting of Jersey breeders and dairymen will be held at Ryan Hall, Tulare, Cal. Among the speakers will be Judge Peter J. Shields, Guy H. Miller, and very likely one of the most successful to breeders in the Northwest will be there to talk upon the subject of "Feeding Jersey Cows on Official Test". It is intended to open this subject up for general discussion, and it is a very timely one for the Jersey breeders of California. You are perfectly welcome to attend this meeting whether you are a Jersey breeder or not. If you want to have better dairy cows the discussions during the evening may be of help to you.

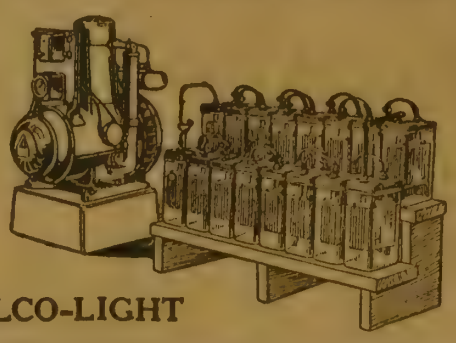
DELCO-LIGHT

ELECTRICITY FOR EVERY FARM



DELCO-LIGHT

"The Best Lighted Farm in the County"

One prominent farmer says:

"Delco-Light has actually added to the value of my farm—

"The neighbors speak of it as the best lighted farm in the county—

"But it is more than that—it is the best place in which to live—and to raise a family."

Delco-Light brings city comforts and conveniences and economies to the farm.

It lights the house and barn—it furnishes power to pump the water, wash the clothes, churn the butter, separate the cream—run the vacuum cleaner and the electric fan.

It is so simple that a child can operate it and so economical that it actually pays for itself in time, labor and fuel saved.

GOD'S GARDEN

Written for California Cultivator
By Ida M. Blake

"Are there any weeds in God's Garden?"
I asked of my soul today.
"Maybe you're a weed," came the the answer;
"Better find out right away.

"For God doesn't want things useless,
To hinder and choke out the flowers
That grow in His beautiful Garden,
Where he spends His golden hours."

"But where is this wonderful Garden"?
Impatiently I asked Him then,
And He answered so loving and tender,
I marveled at His patience with men:

"My child, the world is the Garden,
And all who dwell therein,
May be flowers of rarest beauty,
Or weeds, burdened with sin."

CANNING BEANS, CUCUMBERS AND SALMON

Written for California Cultivator
By Louella Barker, Fields Landing

IN reply to your question as to what kind of vegetables did I can and did it pay, I have this to say:

I canned string beans so simply and so successfully that my method may interest some other housekeeper. We had in our garden stringless green pod and Kentucky Wonder beans in quantities especially for canning and as we ate them this winter we concluded that it did pay both because it was cheaper and we felt free to use more than if we were buying them.

Gather beans and string them, or at least break off the ends and break into inch lengths. Let them boil in salted water about half an hour. This takes about an hour, for it takes a good sized kettle half an hour to come to boiling. Have jars and tops hot, fill very full of beans and have some good vinegar at boiling heat and put one or two tablespoons in the top of jar and seal. When wanted for use pour off water and wash in one or two waters and cook as you would fresh string beans. I have canned them two seasons in this way and never lost a jar.

Cucumbers and Onions

Have about twice as many cucumbers as onions. Slice separately and let stand over night with plenty of salt sprinkled over them. In the morning drain and fill jars, using about twice as many cucumbers as onions. Heat vinegar to fill jars. It takes but little more than one good sized teacup of vinegar to a jar, and to each cup use a tablespoon of sugar and a small teaspoon of ground mustard. Boil these in the vinegar, then let vinegar get cold, fill your jars, screw on tops and set in cool place till wanted. Have kept these a year and they were fine. By first filling jars you know how much vinegar to prepare. The jars used are quart size. These make an excellent relish and are much easier than most pickles to prepare.

Salmon

We live where we can go trolling when the salmon are coming in in the fall, and usually catch a good many of them. We clean the fish, cut it into lengths to go in the jars and cut into about two-inch strips and press into jars just as tightly as possible, then put in enough salt for the quantity of fish and if the fish does not seem very fat, I put a little olive oil in, then put the rubbers on jars, place the lids on, but not screwed on tight, and for pint jars boil in the boiler between three and four hours; for quarts, an hour longer. Have the water part way up sides of jars, but not so it gets into them when boiling. Do not put any water in jars. Have the water boil steadily and screw tops tight when taken out. Keep in cool, dark place.

These help to rob the high cost of living of some of its terrors for us, and are easily put up. I have never lost any of the cucumbers or salmon. And most people seem to like the home canned salmon better than that canned by the canneries.

SAVE YOUR BOTTLES

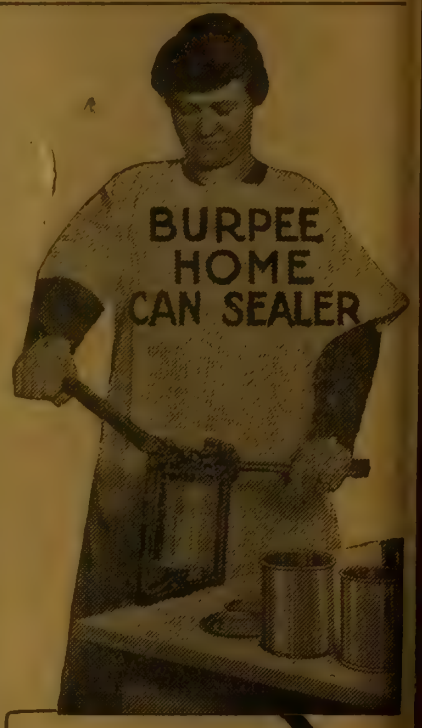
A serious shortage of preserving jars and cans is threatened. Glass bottles, especially wide-necked ones, are useful for putting up fruits, jellies, and preserves. Put up fruit juices in ordinary bottles.

Reserve regular preserving jars and cans for canning vegetables, soups, and meats.

FRUITS, preserves, jellies, jams and fruit juices if sealed with corks and paraffin, can be kept perfectly in these makeshift containers. Jellies, jams, and preserves can be kept even in ordinary drinking glasses, by the use of paper and paraffin. Fruit juices should be packed in ordinary small-necked bottles.

Vegetables, soups and meats, on the other hand, to keep must be sealed by the usual fruit jar or tin can packing methods. Reserve regular containers for foods that can not be packed in bottles.

The specialists of the United States department of agriculture are also urging all members of canning clubs and others not only to can products, but to dry and evaporate all such products as apples, pumpkin and squash.



ARE YOU READY FOR HARVEST

Fruits and vegetables will soon be ready for market. Are you sure that you can sell all you produce? Insure yourself against glutted markets, waste and loss by buying a

BURPEE HOME CAN SEALER

The strongly built, simple, easily operated machine for sealing sanitary tin cans without acid or solder. Clamps on any kitchen table.
It will save all those fruits and vegetables you might have to feed the hogs. It will start you in a new and highly profitable business. Made and guaranteed by one of the biggest canning machine manufacturers in the country. Cans easily secured. Free book of canning recipes, compiled with the assistance of the U. S. Dept. of Agriculture, with each machine. Write today for information.

The Cultivator Patterns

8275—Ladies' Set of Pockets. Cut in one size. The pattern consists of six different styles of pockets.

8282—Girls' Dress. Cut in sizes 4 to 14 years. The dress slips on over the head sleeves may be long or short and the waist perforated for applied yokes.

8289—Ladies' Dress. Cut in sizes 34 to 42 inches bust measure. The dress has a plain waist with large collar and a one-piece straight skirt with tucks.

7802—Ladies' Waist. Cut in sizes 36 to 44 inches bust measure. Any of the pretty figured materials can be used for this waist with the collar and cuffs of plain goods.

8309—Children's Dress. Cut in sizes 2, 4, 6 and 8 years. The waist is in overblouse effect and the straight gathered skirt is joined to an underwaist.

8307—Ladies' Overalls. Cut in sizes small, medium and large. The bib may be omitted and the trousers may fasten above the knee to form bloomers.

7803—Ladies' Skirt. Cut in sizes 22 to 30 inches waist measure. The skirt is cut in three gores.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full. Give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

Pattern Department
California Cultivator
Los Angeles

They advise strongly that if containers are scarce locally, those in stock should be used to preserve perishable products which have the highest nutritive value. Nothing should be packed in jars or cans which can be conserved effectively in other ways.

Candy containers or other glass jars with screw tops or glass stoppers, and in fact any receptacle of glass, crockery or porcelain, can be sealed with cork or paper and paraffin.

Large tin canisters or tin cans with removable covers, provided the body of the container is air and water tight, will be found useful in canning certain fruit products. Such containers can be sterilized and their covers hermetically sealed in place with solder or wax.

INEXPENSIVE TOILET RECIPES

Written for California Cultivator
By A. M. H.

TO make an excellent remedy for bunions on the feet fill a four-ounce bottle half full with coal oil and put into it an ounce of gum camphor crushed fine. Keep tightly corked and shake occasionally until the camphor dissolves, then use this freely on the bunion. When there are hard corns and callous places on the feet use a piece of pumice stone, not the smooth kind prepared for the hands but a lump in the rough. Rubbing with this reduces the callosity, after a time removing it entirely if the surface is protected from further hurt.

To treat an ingrowing toenail, saturate a little piece of antiseptic cotton with laudanum, then raise the edges of the nail and press the cotton under the edge of the nail as far as it can be pressed without pain.

Hot milk is a safe and nourishing lotion for the skin to restore its plumpness, laying linen wet in it on the cheeks after the face has been massaged, and thick sweet cream makes a fine skin food, and if used often, by rubbing it well into the skin, it will fill out the cheeks and help to keep the wrinkles away.

Enlarged pores are the cause of both pimples and blackheads, and a little tincture of benzoin used in the water when bathing the face will help to close the pores. An excellent lotion for enlarged pores is made with one dram of boric acid in four ounces of distilled witchhazel. This must be applied with a piece of soft linen.

A trained nurse gives this recipe for a toilet powder that is excellent for both grown people and children, and it is easily prepared. Mix well together one part of boric acid powder with three parts corn starch, and if a perfume is desired a drop of oil of rose may be added.

One of the best salves to use for skin eruptions or any soreness of the skin is made with equal parts of powdered boric acid and vaseline.

To make an excellent powder to use in the shoes when one must take long walks or be much on their feet, mix well together four parts of the boric powder, one part salicylic acid and five parts of pulverized starch. Sprinkle a little of this powder in the shoes every morning and it will help to absorb the moisture and make the shoes feel easier on the feet. To rub the feet with alcohol refreshes them wonderfully, and nothing is as good for them as a vigorous alcohol rub after they have been wet or chilled. A rub with cocoa butter is a fine thing for the feet at all times. A cake of cocoa butter can be bought at any drug store for a trifle.

LINCOLN'S EARLY ACTIVITY

Little Hattie, determined to give her hero full credit for his achievements, wrote the following in a history examination:

"Abraham Lincoln was born February 12, 1809, in a log cabin he built himself."

IT WAS TOUGH

Hostess (serving mutton)—Doesn't it seem a shame, Mr. Jones, that this poor sheep should have to die for us?

Mr. Jones—Ah, yes, indeed! It is rather tough.

NO DELAY

"Do you ever ask your wife's advice about things?"

"No, sir; she doesn't wait to be asked."—Boston Transcript.

ALL THE YEAR ROUND

Cooler cooking in summer—better and more economical cooking all the year 'round.

A good oil stove will cook anything that any wood or coal range will cook, and do it better because of the steady, evenly-distributed heat.

All the convenience of gas. Meals in a jiffy, and a cool kitchen in summer.

Tells why chicks die

E. J. Reefer, the poultry expert, 4265 Reefer Bldg., Kansas City, Mo., is giving away free a valuable book entitled, "White Diarrhoea and How to Cure it." This book contains scientific facts on white diarrhoea and tells how to prepare a simple home solution that cures this terrible disease over night and actually raises 98 per cent of every hatch. All poultry raisers should certainly write Mr. Reefer for one of these valuable FREE books.

Feeding Baby Chicks

Written for California Cultivator By Jean A. Koethen

IN addition to the duck yard and duckling pens, Plymouth Poultry Ranch has yards and houses for several hundred hens. Two breeds are kept, White Leghorns and Barred Rocks, and it is rather surprising to learn that the Barred Rock chicks have this year been considerably more in demand than the Leghorn, 1700 having been sold since Christmas.

The chicks are brooded under hot water pipes, and after the two days' of rest and quiet which all chicks require, are fed a nursery feed of commercial chick feed for two or three days. This is fed on a large square wooden tray, which is placed just outside the hover, so that the chicks need not be chilled when they come out to eat. If dry bread crumbs are available, they are mixed with the chick feed. After these few days of nursery feeding the little birds are put at once on a ration which is being tried by many poultrymen this year, i. e., dry feed meal and beef scrap in separate hoppers. These two hoppers or troughs are kept before the chicks at all times, and they have nothing else. At first a fine feed meal is used, but later a coarser grade is substituted. This is proving just as satisfactory as the more expensive diet of commercial chick feed and elaborate mash. The chicks like it and thrive on it. No other feed is given till the birds are old enough to eat Egyptian corn, which is thrown into the pens after they are perhaps six weeks old, and which they gradually learn to eat. This ration of corn meal, beef scrap and Egyptian corn is continued till the cockerels are ready for market and the pullets for the laying pens.

At about two months of age, the chicks, which have been moved along from one brooder to another till they have learned to do without heat at night, are removed to the cold brooders with slatted bottoms. The cockerels go from these cold brooder pens to market, while the pullets are given more room until they are ready for the pullet section of the laying house.

A "Different" Laying House

Many of the laying houses in Inglewood colony are built after a model which is not often seen elsewhere. This is what might be called the "double-decker" or two-story style. The floor of the Ely laying house is fully three feet from the ground, with a trap door and stairway giving access to the ground underneath. In damp weather the hens are thus provided with a sheltered scratching place. When it is very rainy the trap door is closed and they are confined in the house. As the roosts are built high, so that the dropping boards are three feet above the floor, and a large floor space is provided in front of the roosts, the hens have abundant room for scratching in the deep litter which covers the entire floor. The front of the house is closed except for the upper three feet, which is of wire. Poultrymen who use this type of house claim that it is not only rat proof, but because of the protection it gives from the weather, induces the highest possible egg production.

COTTON SEED MEAL FOR POULTRY

Cotton seed meal in rather limited amounts has been fed, since last November, with excellent results, to a pen of 30 pullets on the experiment farm of the United States department of agriculture at Washington, D. C. These pullets have averaged 52,3 eggs each in 20 weeks, from November 1 to March 20, which is practically equal to the best egg yield received this year from any of the other experimental rations. No bad effects have been noted from this feed, either in the eggs or in the condition of the fowls, and the hens eat this feed freely. The ration is as follows:

Dry Mash.—Two pounds cotton seed meal, two pounds beef scrap, four pounds bran, five pounds middlings, nine pounds corn meal.

A large per cent of cotton seed meal in a dry mash without any beef scrap has not given satisfactory results. Pullets fed a ration with 33 per cent cotton seed meal averaged only 33.2 eggs apiece in one year. A considerable per cent of these eggs had discolored yolks, with green or brownish-green spots, making them unfit for market. The hens did not like this mash and had to be forced to eat it by feeding a very limited amount of scratch grains.

These results appear to indicate that cotton seed meal can be fed at the rate of about ten per cent of the mash, or five per cent of the total ration, with an equal per cent of beef scrap with excellent results. In sections where cotton seed meal is produced, half of the beef scrap in the mash apparently can be replaced by cotton seed meal with excellent results.

POULTRY NEWS

By C. A. Wilkins

One of the most important meetings of the California State Poultry Breeders' Association will be held at the university farm Davis, the afternoon and evening of May 30. Matters of interest to every poultry breeder in California will be brought up for discussion and papers of timely interest will be read. War conditions and the poultry industry probably will be freely discussed. In the evening an illustrated lecture will be given by Prof. J. E. Dougherty. A number of poultry experiments will be brought to a close at that time and explained to those in attendance.

The American Poultry Association of California is to meet at the same place on May 31, 1917.

Efforts are being made to have Mrs. S. T. Campbell of Mansfield, Ohio, named to fill the vacancy in the office of secretary of the American Poultry Association, caused by the recent death of S. T. Campbell, who for many years was secretary of the organization.

More than 100 ranchers and others interested in poultry attended the monthly meeting of the Stanislaus Poultry Association held at Modesto, April 12. The merits and use of the Hogan system were explained and demonstrated by C. W. Presher of Ripon.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, report for the 25th week ending April 24, 1917.

The Plymouth Rocks got first two places with a safe margin, leaving the Reds and Leghorns to vie with each other for third position.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Fairfield Poultry Rarms, 936; Merritt M. Clark, 779; Jules F. Francais, 749.

White Wyandottes

Merrythought Farm, 920; Obed G. Knight, 834; A. L. Mulloy, 817.

Rhode Island Reds

Jacob E. Jansen, 905; Allan's Hard to Beat Reds, 896; Geo. W. Harris, 893.

White Leghorns

A. P. Robinson, 1075; J. O. LeFevre, 917; Hilltop Poultry Yards, 903.

Miscellaneous

Obed G. Knight, 853; Cloyes & Sullivan (Buff Wyandottes), 825; Hollister Hill P. Farm (White Rocks), 807.

A hen will eat at least a bushel of grain a year if she can get it. Put aside that amount for each one and see that each one gets her share.

The bright eye, red comb, smooth, bright, well-kept plumage, activity and the keen appetite indicates the healthy fowl.

All hoppers should be sufficiently high above the litter to be kept as free from dirt as possible.

A load of gravel scattered along houses and coops would greatly contribute to the health of many a flock

A good snatch feed is made of equal parts of corn, wheat and oats by weight.

Coal ashes make a good disinfectant to use on the drop-boards and around the hen yards.

The more energetic the hen the more water she will drink.

Red Comb Chick Mash With Buttermilk

RED COMB CHICK MASH with Buttermilk

The greatest Chick Grower ever produced. Prevents White Diarrhoea—Authority for this statement found in Bulletin No. 162, University of California, Berkeley, California. Write to Berkeley for this bulletin. Hale & Edwards Co., Chicago, who manufacture the RED COMB and RED HORN FEEDS are the only people who have succeeded in drying buttermilk—without killing the Lactic Acid Bacilli or materially reducing digestibility. Tests made after this Dry Buttermilk has been manufactured SIX MONTHS show 10,000 Live Active Lactic Acid Bacilli to the centimeter. Send for a small sample of this Dry Buttermilk and convince yourself of its merit.

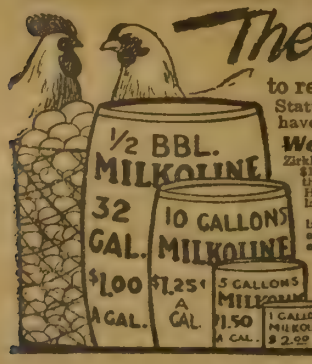
There isn't enough Pages in this paper

to repeat even half of the enthusiastic praise which the Big Poultry Feeding Stations, Poultry Authorities, Pure-Bred Poultry Breeders and Farm Poultry Raisers have said about Milkoline — if you'll try it, you'll say something nice too.



We Don't Ask You To Take Our Word—Read This:

Zirkle & Coffman, Breeders Thoroughbred Poultry, Virginia, write: Enclosing check $12.60. Please ship ten gallons Milkoline. Have used with such success that neighbors want some. Will not have enough to see us thru.

Have not had case white diarrhoea among chicks so far, last year we lost about half them with it.

W. G. Tainter, Kansas, writes: Have been using Milkoline for few months and getting greater number of eggs per hen than any year since going into business on larger scale. Ship me half bbl. more. I would rather be without grain than Milkoline, as it is a tonic as well as a food.

ONE GALLON OF MILKOLINE

The wonderful assimilating and digesting qualities are highest in Milkoline of any known feedstuff. Adds vitality, growth and fattening—eliminates Diarrhoea and disease.

Trust John W. Bate

To Build a Car As You Want It

The latest Mitchells will show you that John W. Bate is a master at building cars.

You have never, at any price, seen a car so complete. You have never seen such luxury, so much over-strength, at anywhere near our price.

How Mr. Bate Works

Mr. Bate, the great efficiency expert, has spent 14 years on Mitchells. The latest Mitchell is his 19th model. It is the final result of 700 improvements.

But he started by building this model plant, which now covers 45 acres. He spent millions of dollars to build and equip it to build this one type economically.

Nowhere else in the world could a car like the Mitchell be built at the Mitchell cost. His methods will save us on this year's output about $4,000,000.

It is that saving which pays for all the Mitchell extras, and gives men these matchless cars.

31 Extra Features

There are 31 features in the Mitchell which nearly all cars omit. Things like a power tire pump, reversible headlights, dashboard engine primer, ball-bearing steering gear.

There is more beauty and luxury than was ever before combined in a modest-priced car. The reason is, we build our own bodies. And all we save goes into this extra luxury.

And no other car has Bate cantilever springs. They make the Mitchell ride like an aeroplane. In two years' use, on many thousand cars, not one of these springs has broken.

100% Over-Strength

But the chief Mitchell extra is double strength in every vital part. In the past three years we have doubled our margins of safety. We are making the Mitchell a lifetime car. Three of these cars have already run over 200,000 miles each. That's 40 years of ordinary service.

Over 440 parts are built of toughened steel. All safety parts are vastly oversize. All parts which get a major strain are built of Chrome-Vanadium.

In these days of high steel prices, any car which is built this way is either rare or costly.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase and a highly-developed 48-horsepower motor.

Price $1460, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines, with 120-inch wheelbase and a 40-horsepower motor—¼-inch smaller bore.

Price $1195, f. o. b. Racine

Also six styles of enclosed and convertible bodies. Also new Club Roadster.

Everything You Want

Mr. Bate has worked 14 years to combine in Mitchells everything you want. He spent one year in Europe, to glean the best ideas from there.

Before designing this year's Mitchells, his artists and experts examined 257 new models. So all the known attractions are combined in these Mitchell cars.

One Size, $1195

The smaller Mitchell—Mitchell Junior—costs only $1195. Yet it is a powerful Six, with a 120-inch wheelbase. You never saw such value in a car around this price.

But the larger Mitchell offers special value. See both sizes. See the extra features, the extra beauty and the extra strength. You will want a Bate-built Mitchell then for the car you buy to keep.

If you don't know the nearest Mitchell dealer, ask us for his name.

Remco Redwood

REDWOOD FOR DURABILITY

What a Remco Silo Means

1. That you are able to store your crop when feed is plentiful.
2. That you have green, succulent feed when range feed is scarce and grain high.
3. That you will get more and better milk.
4. That you will more than save the cost of the silo every year.

What a Remco Tank Means

1. That you can store water when wind power can be had FREE.
2. That a good supply of water is always on hand for home and farm use.
3. That you have reliable protection against fire.
4. That you will never have tank troubles.

What Remco Pipe Means

1. That you have an uninterrupted flow of water.
2. That your pipe will last longer than any concrete pipe or metal pipe except cast iron.
3. That your pipe will cost you less than any metal pipe.
4. That your pipe will stand heavy pressure either pumping or gravity and no standpipes are necessary.

REMCO FOR MECHANICAL PERFECTION

REMCO SILOS, TANKS AND PIPE are made from CLEAR, AIR DRIED REDWOOD. They are manufactured by skilled mechanics using the most modern wood working machinery.

You can avail yourself of the experience and skill of our experts, who have made particular study of Pacific Coast needs. ALL INFORMATION IS GIVEN ABSOLUTELY FREE.

The Holstein-Friesian a Great Dairy Cow

California Has a Host of Black and Whites Which Have Produced Wonderfully. Some of Them with Official Records of Over 30 Pounds of Butter in Seven Days Are Shown in Photos in This Issue

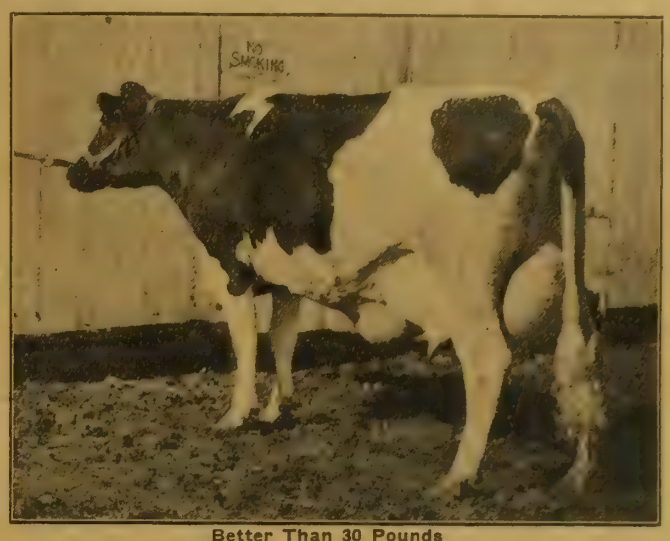
A GROWTH in popularity almost sensational has been given to the Black and White breed, or, more correctly, the Holstein-Friesian. This dairy cow has been in California for many years, but during the past 5 years her increase in popularity has been much more rapid than prior to that time, and today there are in this state more of this breed than of any other.

The native home of the Holstein-Friesian is Holland, though various strains of the breed are scattered over much of Northern Europe. Its origin is obscure; it has been claimed that for over 1000 years the people of Holland have kept them and been famous for the production of milk, butter and cheese.

"A quarter of a century ago," writes Plumb in "Types and Breeds of Farm Animals", "cattle were brought to this country under the names of Holstein and Dutch Friesian, being sold as different breeds and championed by different breeding associations. The name Holstein has no application in Holland, but refers to a small province in Germany, between the Baltic and the North Seas, about a hundred miles east of the Holland boundary, where black and white Dutch cattle are found. The word Friesian is derived from Friesland province, Holland, and this is the name the breed should go by in America, as it does in Holland, for no such breed name as Holstein-Friesian is used in the latter country. In view of the fact that all of the cattle imported from Holland to America are essentially the same, the breeders and importers finally came together and united their interests and agreed to call the breed Holstein-Friesian. If the word Holstein could by agreement be discarded, it would give a more appropriate and simpler name."

These cattle were first brought to America by the early Dutch settlers of New York, so that the breed has been in America for some hundreds of years.

That Californians have secured some of the finest blood in the world is shown by photos of California cows in this issue of the Cultivator which have produced in seven days 30 or more pounds of butter.



Better Than 30 Pounds
Salo Canary Mercedes Burke, 31.77 lbs. butter in 7 days. Property of Morris & Sons.

Better Than 30 Pounds.
The first cow, the one at right of picture, is Boweda, 31.91 pounds butter in seven days, 123.45 pounds butter in 30 days. The other three are all A.R.O. cows, close to the 30-pound notch. Owned by Stanford Ranch at Vina.

Better Than 30 Pounds
Aaggie Acme of Riverside 2nd, 35.38 pounds butter. In 90 days her butterfat and milk products aggregated $142.30, or well up towards $50 per month. Owned by Morris & Sons.

CALIFORNIA HOLSTEIN-FRIESIAN ASSOCIATION

Written for California Cultivator
By Fred W. Kiesel, President

THE California Holstein-Friesian association is going along fine, had a big meeting at Modesto on April 18 and an exceptionally large one at Napa State Hospital on May 5. At the latter place a most unique banquet was tendered by Mr. Owen Duffy, who spread tables right in the dairy barn, and while the banquet was in progress the cattle were led in and milked.

An association of this kind can cover a large field. It is not only an organization intended to bring together Holstein breeders and promote good fellowship, but it is educational to all the outsiders who attend our meetings. The visitors in many cases consisted of very prominent people in other walks of life, who were amazed at the cleanliness and sanitation practiced in modern dairying and were surprised that they could eat a meal in a dairy barn under perfectly sanitary conditions. Among the state officials at the Napa meeting, in addition to several members of the board of managers of the institution, were John Neylan, chairman of the board of control; Colonel Chambers, state controller, and Bismark Bruck, assemblyman.

The Holstein is adapted to California particularly because, generally speaking, we can raise feed in quantities; the animal being large and bulky consumes from one-third to one-half more than the Guernsey or the Jersey, and in return increases the quantity of milk over these last two mentioned breeds in about the same proportion. What we want for general consumption is a big milk factory, rather than a small one containing a higher percentage of butter fat.

A good Holstein herd now has no difficulty in meeting the requirements of any community. Approximately three per cent of the Holsteins in the state are pure bred.

I am told by butchers that the animal cuts up well on the block, but of course not to be compared with either of the beef strains, to-wit, Shorthorns or the Herefords, but is a big improvement over any other dairy herd.

Better Than 30 Pounds

Jane Korndyke of Riverside. Butter 7 days 31.47 pounds. Owned by F. W. Kiesel.

Wilhelmina Gerben De Kol. Butter 7 days 30.43. Owned by Morris & Sons.

Diotjme Clyde Korndyke. Aver. 31 lbs. Owned by Santa Anita Rancho.

We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

California redwood enters into our cover illustration in a large way this week. This illustration shows a typical California dairy barn scene on Stanford Ranch near Mayfield, Santa Clara County. There are many such silos in the state, but we hope their number will vastly increase during the next year. These days of high-priced concentrates, and even of high-priced roughage, demand the saving of every straw. The saving is accomplished to a greater degree in the manufacture of silage than in any other way.

May we have more silos; may we have more pure bred cattle about them. It means a help toward the giving to the world that food which it now most seriously needs, and it means profit to California.

HOLSTEIN-FRIESIAN

Much of our space this week is given up to the Holstein-Friesian. The beautiful animals are doubly beautiful because of being in the "handsome is as handsome does" class. To this breed belongs the honor of producing the first cow to "come across" with 50 pounds of butter in seven days. The live stock world stopped and stood at attention when this cow back in Michigan made her wonderful performance record. But there are others—and in California—none which have made 50 pounds of butter in a week, but many which have made more than 30 pounds. Note the illustrations in this issue of a very few of them.

DON'T BE TIGHT

We have seen a new slogan in our present conservation campaign. We have been urged to save a starving world by eating to the last crumb, and not overeating at that. The world is going hungry. Now, however, the promoters of the conservation idea are finding that the world is taking the advice at its full value and conserving so rigidly that merchants the United States over are holding up their hands and appealing for their old-time customers to come back.

The new slogan is "Sit tight, but don't be tight." It contains a valuable lesson and has a hint on which we may well act. Notwithstanding, we presume there will be exceedingly careful buying on the part of nearly all of us for the next few months. But honestly there appears to be every promise of great business and the expenditure of great funds in this country, and the farmer who is far-sighted enough to fully equip his place, fertilize and care for his crops, even at the expenditure of large sums, will have something coming back. This is the time for doing things and not conserving to the extent of penuriousness.

QUALITY

We have talked so much about producing more that some of us may possibly think that the greatest good to the country may be secured by producing quantity. Bear in mind that no farmer gets rich by producing quantity. It is the price he gets for his product and economy and business judgment are factors, and price is determined by quality. Produce the best, and the price will in large measure take care of itself.

CONNECT UP WITH THE SOIL

"If we are going to connect up our men with the soil we must do two things. Credit must be provided so that these young men can start to farm and the values of farms must be based on their use for productive purposes and not on an increased price based on an additional speculative value. A credit system suited to the needs of the farmer would enable young men to become tenants instead of remaining laborers. Then as a tenant, since land would be lower in price due to no added speculative value, it would take a shorter period for him to save enough to make first payment and become an owner. Then again as an encumbered owner credit suited to the farmers' needs would shorten the period required for saving enough to pay off the mortgage. If we do not establish a system for helping young men to connect up with the soil and then as rapidly as possible to become owners, we are going to boost for an ever increasing percentage of tenants and for more and more farm laborers. The net result will be to drive more and more of our young men to the cities."

The above quotation from a keen observer is an expression of a condition which all have recognized but few acted upon. Now, will California have opportunity to make a most practical test in connecting up a number of young men with the soil?

Our land colonization commission has been two years in gathering data; this data it presented to the legislature; the legislature has acted, and now for a trial. Young men of small capital, more experience and good health and determination may now possibly own a farm of their own. It will take time longer than most of us will be patient with to bring this first practical test of this kind in the United States to the working stage, and the country will be watching us. We hope a far-seeing man like Dr. Mead may prove that California conditions under California laws, with determined young men, will make a success of a practical land colonization scheme.

LOS ANGELES EXPOSITION

In the midst of a war which is almost throttling her very life France appreciates the necessity of inspiring her agricultural classes to produce to the utmost limit, and to that end is holding, so far as possible, her regular agricultural fairs. Extremists in America have suggested that the movies and all forms of recreation be suppressed and that we should settle to the work of doing only that which means support for our country, either through agricultural production, manufacture or active aid in the war. We believe that such suggestions result only in throttling the best endeavor. These are times when we must see things in their larger aspect, and to that end anything which gives us opportunity to see the best that our neighbor is doing will inspire us to equal or better his achievement.

The California state fair and all the county and district fairs should be, and we believe are to be, held this fall. In the state legislature suggestion that these be discontinued was repudiated and the legislators decided that this means of encouraging agriculture should be continued.

The newest of these fairs, or rather an exposition which in a sense is one of the oldest, is that of the former Sixth District Fair Association of California at Los Angeles. This association has changed its name to the District Fair Association of California and proposes to hold a 30-day exposition. There will be exhibits during the entire exposition period. Some, like live stock will have only seven-day periods.

Other features of an educational nature will be planned. One we may mention, on which work has already begun, is a demonstration garden. A plot of ground has been set aside and on it will be planted at once crops which will be matured and removed and other crops planted prior to the fair. As these crops mature they will be canned or processed so as to preserve, and this canning or drying will be a practical day by day demonstration for the benefit of home and school gardeners of Southern California. Saturday and Sunday afternoon demonstrations in canning and drying with small outfits will be conducted.

But the most admirable thing in the preparation for this, which we believe will be a great exposition, is the usual Los Angeles get-together spirit which is shown. "Boost for a big fair" is the expression one hears everywhere, and from Los Angeles this spirit will soon reach the producing districts. Even now live stock men and growers of field crops are preparing for winning the honors at this exposition.

BE JINERS

NOTE the call of the president of the California Holstein-Friesian Association for every breeder to become a member of the association. Also note that California Shorthorn breeders have a similar association. The Hereford men have issued their get-together call for an early date in June. The Jersey breeders' association has been in existence for years and has done some exceptionally fine work for that breed. The swine breeders, the wool growers, in fact almost every line of activity which has to do with animal husbandry in California is organized.

Every live wire breeder should be a member of his association.

Agricultural Notes

The Bermuda onion crop of Tex is estimated at 6388 carloads.

There is now a heavy movement green beans from Florida, Louisian Alabama and Mississippi.

The United States consumes mo sugar than any other country, on fourth of the world's production.

The price of milk in Australia h been fixed by law at nine cents quart at the dairy, or 11 cents if d livered.

The department of agriculture recommending that much of the ry planted for turning under as a gree manure be harvested for grain.

The government of South Africa h four agricultural schools in operatio in that state. The attendance has bee seriously cut by war enlistments.

Ground clover and timothy hay fo human consumption is being made th subject of tests by a New York chem ist. The meal he expects to make int palatable bread.

Oil mills on the Pacific Coast hav been operating for several years wit soy beans imported from Manchuri and have found a ready sale for th oil, cake, and other products.

The Saskatchewan department o agriculture maintains poultry killin stations at Saskatoon and Regin The fowls are here graded and packe and poultrymen receive payment i advance according to quality.

Citrus planting is rapidly increasin in Australia. Recent figures of th commonwealth statistician show a acreage planted to oranges in Queen land, South Australia, West Australi and Victoria of nearly 10,000, lemon 700.

A four-day school in apple packin has just been held at Fredericton, Ne Brunswick, by the department of agr culture. The government will also i stall a fruit inspection service to a in production of a higher quality o fruit.

The National Duroc-Jersey and Am erican Hampshire Associations wil each give $50 in prizes to boys rank ing highest this year with Duroc-Jer sey and Hampshire pigs in the pig contest conducted by the agricultura college.

The Canadian government has placed wheat on the free list, thus opening United States markets to Canada and Canadian markets to the United States. The order is due to difficulty of securing ocean tonnage to send abroad.

Ten million dollars is to be loaned to farmers of New York by the Patriotic Farmers' Fund at 4½ per cent. This fund is for the use of real farmers, not "would-be's", and is intended to "increase acreage and crops, not number of farmers".

England's food controller has prohibited the sale of light pastries, muffins, crumpets or tea cakes. Cakes, buns, scones and biscuits can only be sold if they conform to the drastic restrictions respecting the amount of wheaten flour and sugar used.

Argentina has a steadily growing number of pedigreed cattle, Shorthorns heading the list with 43,000. Hereford, Aberdeen Angus, Flemish, Red Polled, Jersey, Red Shorthorn and Devon, all are represented by pure breds. A shipment of American Shorthorns sold at auction in Buenos Aires five months ago brought an average of $1047, while two lots of British stock sold at the same time averaged $1731 and $3421, respectively.

Agricultural News Notes of the Pacific Coast

Northern California

Thermalito, Butte County, had ripe cherries May 1.

The Colusa Sun reports sales of prunes at seven cents.

Colusa sheep men are reported to be refusing 49 cents a pound for wool.

Three hundred acres are being planted to olives near Palermo, Butte County.

Eight thousand five hundred sacks of rice will be shipped by one concern from Colusa.

The Glenn County farm bureau marketing department has been thoroughly successful.

Two thousand acres of beets at Meridian, Sutter County, are now being thinned.

Napa County reports large increase in acreage to be planted to sorghum and other forage crops.

The California Holstein Breeders' Association met at the Napa State Hospital last Saturday.

Experimental plantings of Tepary, Lady Washington and pink beans will be made in Eldorado County.

The United States topographical survey will take up work in the lower portion of Nevada County during this summer.

Butte County's Spring Festival will be held next week from Monday to Saturday, with full programs for each and every day.

Manager Gilson of the sugar factory at Hamilton reports more than 6000 acres about that factory planted to sugar beets.

Almond Day is the latest of the special days. The second Friday of September has been set apart for honoring the almond.

Report of the Grass Valley chamber of commerce shows planting this season of 234,000 of commercial fruit trees in that vicinity.

Sealer of Weights and Measures Dolan states that the enormous rise in the price of rice the past weeks has been due to speculation.

One of the largest poultry displays ever made in this state it is reported will be exhibited at the Butte County Spring Exposition, May 21-26.

A large live stock exhibit is to be made at the Butte County spring exposition next week. Various national breed associations are offering prizes.

The May 1st forecast of the United States bureau of crop estimates indicates California's wheat crop at 5-7 of its average production, with old crop on farms practically nothing.

Horticultural Commissioner Stabler of Sutter County recommends a paste made as follows for cut worm poison: Bran 10 pounds, white arsenic one-half pound, molasses one-half gallon, water two gallons.

President Stephens of the Pacific Rice Growers' Association warns growers not to join any association until they have had an opportunity to inspect the contracts of the Pacific association, which will soon be ready.

Horticultural Commissioner Gould of Yolo County after a thorough survey of crop acreage in Yolo County reports a big gain in barley acreage, approximating 100 per cent. The gain in wheat acreage is more than 50 per cent. The acreage planted to beans is 34,000 against 3000 in 1916.

Central California

There will be increased plantings of rice by Rio Bravo farmers.

Mooney Grove was the scene of the big Tulare County grange picnic on May 12.

There has been a decided drop in the potato market, both for new and old crop.

Riverbank, Monterey County, is making heavy shipments of strawberries and green peas.

Merced County has a new farm adviser. J. F. Grass has been appointed, beginning his duties on May 15.

The contract has been let for the new peach packing plant of the California Peach Growers at Reedley.

Grape growers of Fairview, Fresno County, have filed articles of incorporation, with headquarters at Sanger.

A branch office of the Mutual Orange Distributors, which was moved from Lindsay to Porterville, last fall, has been again located at Lindsay.

Alleging that seepage from ditches of the Oakdale Irrigation District has damaged his property a rancher has brought suit for $8500 damage.

Directors of the Fresno district fair are arranging for many special prizes for farm products exhibited by school children.

Tulare County Canning Peach Growers' Association has decided not to fix prices this season but to sell to the highest bidder.

Last Saturday members of the Farmers' Union of Stanislaus County gathered at Paradise School for an all-day meeting and picnic.

The Stockton chamber of commerce has gone on record as asking congress to pass legislation to permit immigration of 100,000 Asiatic laborers to harvest California crops.

The founder of Camp Curry in the Yosemite national park, David A. Curry, died last week in San Francisco. Camp Curry was founded in 1899 and is well known to all visitors to the valley.

The April report of the Fresno city license collector shows earnings from the free market for the month of $173.80. It is hoped that the earnings of the market may be applied to the purchase of a market site.

County Squirrel Inspector Anderson of Fresno County is planning to open up new killing districts near Barstow, River Bend, Reedley, Kerman and Fresno Slough. Property holders will be called upon to kill their squirrels.

Breeders of Hereford cattle have been invited to meet at the University Farm at Davis May 29-June 2 to form an organization of coast breeders. The California Shorthorn Breeders have recently formed a state association.

Sugar men are reported offering more money than the wineries for wine grapes. The contract price for the dried grapes is reported at three and three-quarters cents per pound, which is equivalent to $14 and $15 per ton for the green grapes.

The Selma cannery of Libby, McNeil & Libby announces that the shortage of the tin supply will compel drying of all fruits which can be so treated. Canned raisins, which promised to be a big item of this year's pack, will probably not be produced at all.

Southern California

Hemet Valley expects to ship out 75 carloads of Valencias.

Imperial Valley bankers are backing boys' and girls' pig clubs in the valley.

D. R. Malone of Lordsburg has contracted a carload of honey to be shipped direct to England.

Farm bureau centers are being organized at Highland, Bloomington, Rialto and San Bernardino.

It was reported that the tin mines at Temescal will be opened owing to the present shortage of tin for canning purposes.

Heavy shipments of onions are going forward from the Coachella district. It is expected that cantaloupes will soon be ready.

Eighty acres will be planted to lemons, grapefruit, Navels and Valencias on the new experiment station grounds at Riverside.

State Market Director Weinstock recently visited onion farmers of the Coachella Valley to discuss marketing plans for this year's crop.

The new farm center at Highgrove, Riverside County, held its first meeting May 8 and was addressed by the new adviser W. B. Parker.

Various chambers of commerce of Imperial County held a meeting at El Centro on May 17 to discuss organization of a county chamber.

A protection district for the Santa Ana River is still a live issue, especially a proposition to control the river from above Yorba to the upper part of the Newbert Protection District.

Poultry producers of Arlington and vicinity met at Arlington Tuesday, May 15. Secretary Newburg of the Poultry Producers of Southern California gave a demonstration on egg candling.

The semi-annual meeting of the State Fruit Growers, which was to have been held at Riverside in June, has been postponed because of the pressure of the food preparedness campaign.

The California Fruit Growers' Exchange has completed its orchard survey and finds that fully 25,000 acres of orchard can profitably be given to intercrops this year to aid in the food production campaign.

Forage sorghum, Sudan grass and varieties of alfalfa were discussed by Farm Adviser Dougherty at the recent meeting of the Westmoreland farm center. Dr. Cady was also present and talked upon hog cholera.

The California Lima Bean Association, with headquarters at Oxnard, is not a combination in restraint of trade, according to an official report transmitted to the department of justice by Special Agent Webster.

Directors of the Southern California Bean Growers' Association met at Oxnard last Monday to consider effects of the war on the year's activities of the association. Plans to encourage interplanting of beans in orchards are being considered.

The San Antonio Growers' Association is having some trouble in holding members together. Chino members particularly are reported to object to enlargement of the Ontario plant when they had hoped to have a cannery of their own at Chino.

The Coast

Farmers of Plaza, Washington, have cooperatively built a $75,000 grain elevator.

The Federal Farm Loan Bank at Spokane has received $750,000 capital stock.

Spokane County, Washington, will expend $150,000 on highway work this summer.

Sales of Montana wool are reported at 53 cents, many sales being reported at 50 cents.

The Union Stock Yards at North Portland, Oregon, reports best heavy hogs selling at from $15.75 to $15.85.

The Oregon Cattle and Horse Raisers Association held its fifth annual session at La Grande the last week in April.

County Agriculturist Shinn has been holding a series of bean meetings throughout the Spokane Valley of Washington.

Weather conditions at Walla Walla, Washington, are ideal for spring wheat planting which is going forward with much vigor.

Fruit growers of the Northwest are organizing to combat the proposed raise in railroad freight rates. They estimate it would cost them $750,000 annually.

Spokane milk distributors have raised the retail price of milk from ten quarts for $1.00 to nine for $1.00. In Portland consumers pay ten cents per quart.

The Fruit Growers' Agency has elected Paul H. Weyrauch of Walla Walla, Washington, president. This association is composed of growers and shippers of fruit in Washington, Oregon, Idaho and Montana.

The prolonged drouth of winter and early spring has inflicted heavy losses on cattle and sheep in Southern Arizona. The heavy rains of the middle of April have started spring feed and the situation is much better.

The Oregon Horse and Cattle Raisers' Association held its fourth annual meeting at LeGrande, Oregon, the last week in April. A parade of pure bred stock by the breeders of Union County was a feature of the program.

Under the present conditions of the federal farm loan farmers on reclamation projects will not be eligible to loans. There is now a bill before congress providing for the appropriation of several million dollars which will be available to project farmers.

White Leghorns are ahead in the All-Northwest Laying Contest at Pullman, Washington. The record is held by a pen of White Leghorns belonging to J. A. Hanson of Corvallis, Oregon, which in the period from October 15 to March 31 laid 358 eggs.

The state college at Pullman, Washington, has abandoned its building plans for this year and will devote about $114,000 to the agricultural preparedness campaign, to increase the efficiency of the experiment stations, to aid boys and girls clubs and farm extension work.

The United States government crop report shows general condition of winter wheat in the four states of the Pacific Northwest far above the general average for the country. Montana is up to its ten year average; Washington, 24 per cent below its ten year average; Oregon 12 per cent below and Idaho six per cent.

The Planting and Starting of Young Citrus Trees

By J. P. Englehart

IN the planting of young trees we believe we are just on the eve of great discoveries. We are gaining years over former methods in bringing the tree to maturity and to performance record work.

One of the impotant discoveries is to dig extra large holes and put in fertilizers and good soil. Another is in topping back the young nursery tree so as to save every inch of good fruit wood, even if it is the slow growing wood, and to remove only the coarse drone wood, even if it is the rapidly growing material. You thus give the fruit wood the upper hand. You thus have the original budwood that you budded from. The tree will then bear early and bear quality fruit only. In fact it is a performance tree from the start and pays its way from the beginning.

We are studying a young demonstration tree on my place that consists of three limbs, one originating from a sucker bud, one from white wood, or half-grade wood, and one from performance fruit wood. We do not stub the nursery tree but leave the original performance limbs and defoliate them. In stubbing back you lose your valuable original bud and change the entire character of the tree. Thus all the painstaking work of the conscientious budder may be undone. When this unfortunate tree is older scientific pruning alone is able to redeem it and bring back the original bud-wood. Sometimes it can never be restored. The tendency to make performance wood seems to be overcome by the tendency to quickly make wood. Quickly growing wood is, of course, drone wood.

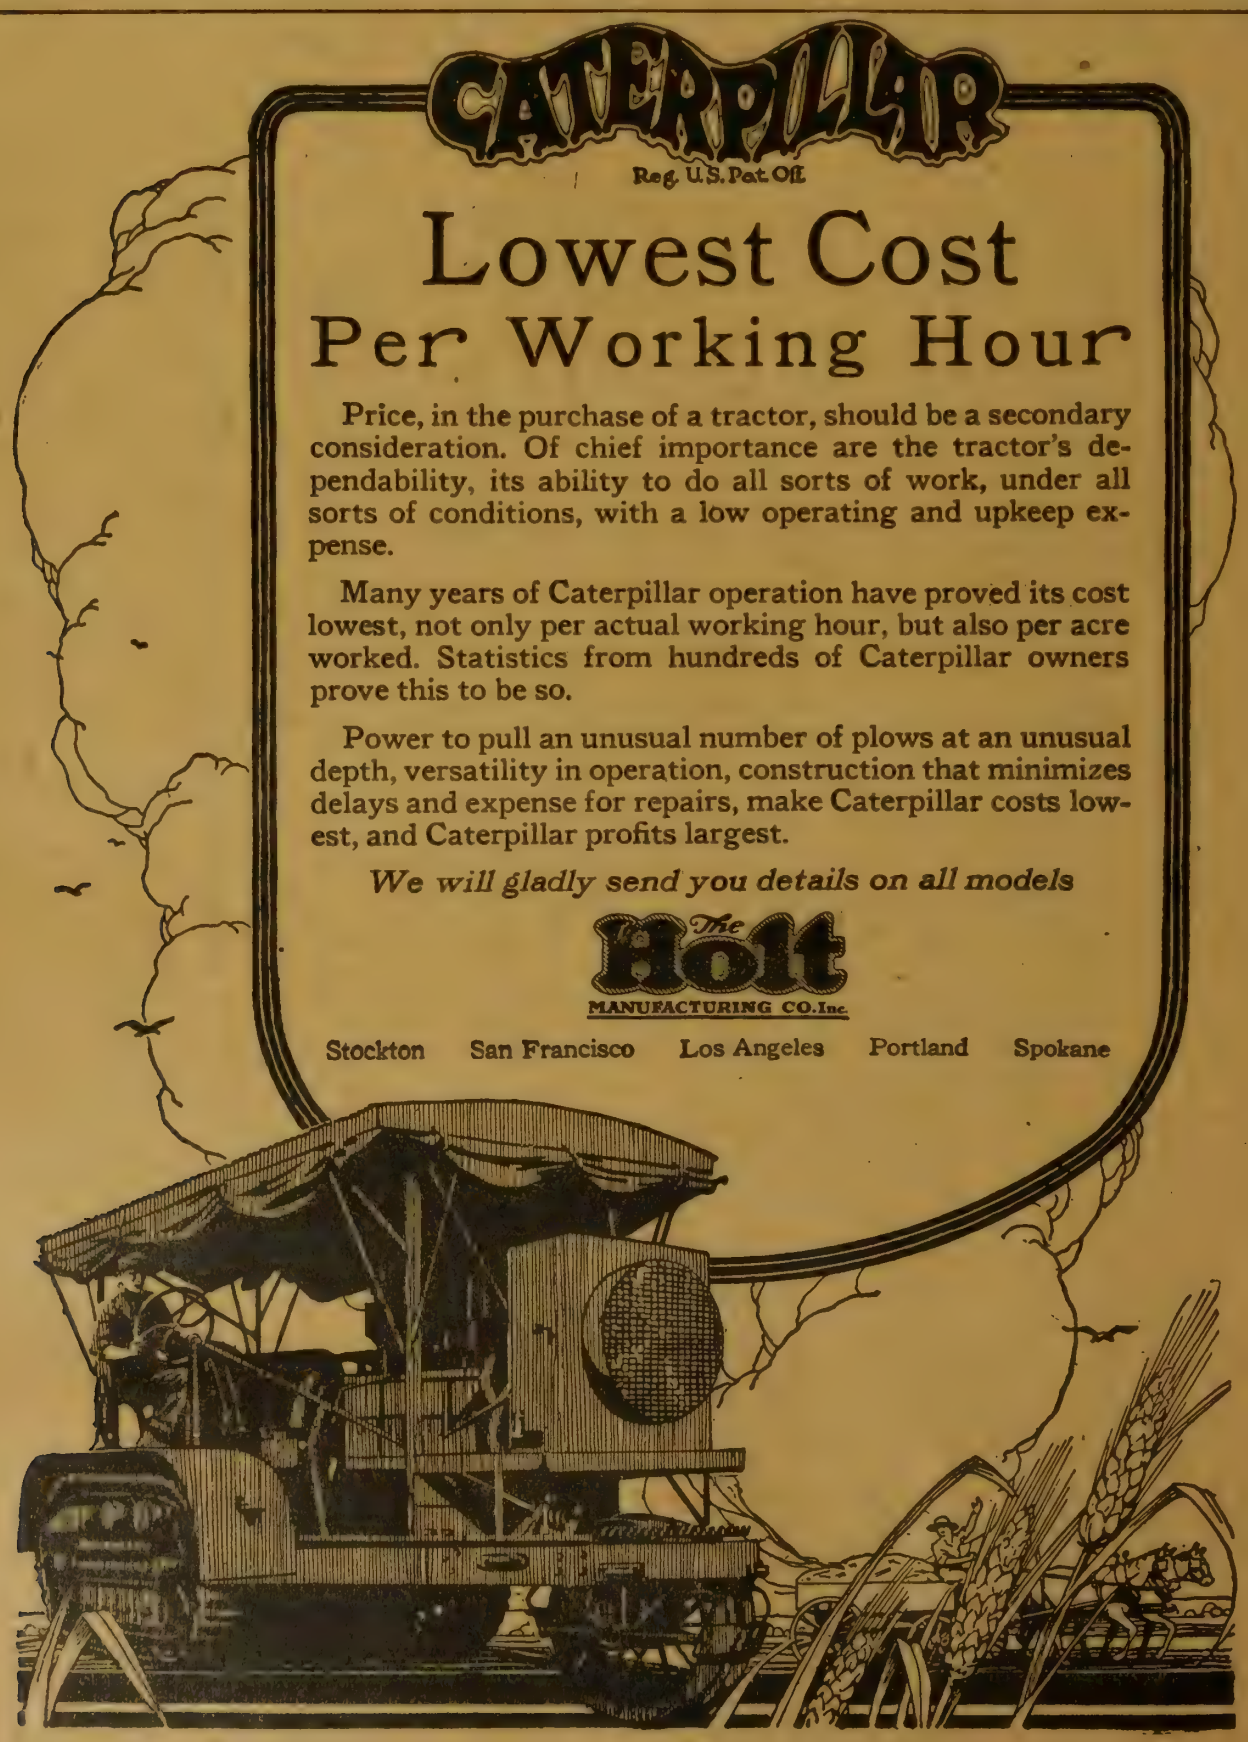
Another thing we have learned is to avoid balled roots in buying nursery trees. Broken roots, knotted and crossed roots, as well as those that were bruised, escaped our attention in balls. Slight bruises can be treated, but severe injuries are serious. In this way gum disease or curly leaf was started several times.

Again, the theory of like producing like was strikingly illustrated in an experience we had with curly leaf.

Avocado Growers Meet

The California Avocado Association is holding a two-day session, May 18 and 19, at Los Angeles, Normal Hill Center, corner Fifth Street and Grand Avenue. The program shows addresses of great interest. Large exhibits of fruits and nursery stock are a feature.

Among the speakers are Lloyd S. Tenny, Coral Reef Nurseries, Florida, "Avocado Marketing From the Florida Standpoint." E. D. Vosbury, U. S. Department of Agriculture, "Varieties of Avocados in Florida." Prof. I. J. Condit, College of Agriculture, "The Avocado in Central and Northern California." Victor Hirtzler, Maitre de Cuisine, Hotel St. Francis, "Methods of Serving the Avocado." Burdette K. Marvin, "Notes on Methods of Pruning the Avocado." C. P. Taft, "The Taft Avocado and Its History." Charles D. Adams, "Notes on Avocado Varieties." Effie S. Rolfs, "Marketing Avocados by Parcel Post." Chas. F. Wagner, "The History and Performance of the Wagner, Lambert, and Surprise Avocados." Prof. M. E. Jaffa, California College of Agriculture, "Further Investigations of the Nutritive Value of the Avocado." Prof. L. B. Scott, U. S. Department of Agriculture, "A Preliminary Report on the Comparative Merits of the Different Avocado Varieties." Martin Fesler, "Notes on Avocado Growing." Mrs. Margaret Stewart, "My Experience in Growing the Avocado." Symposium Discussion by F. O. Popenoe, H. J. Webber and T. U. Barber, "On the Susceptibility of Avocado Varieties to Frost Injury."



CATERPILLAR

JAPANESE PERSIMMON PESTS

Word comes from Dr. W. T. Swingle, Physiologist in Charge, Bureau of Plant Industry, Washington, D. C., to the effect that a serious fungous disease and a serious insect pest on the persimmon occurs in Japan, and State Commissioner of Horticulture G. H. Hecke desires to draw attention of quarantine officers and inspectors of every California county to this pest and warn them to be on guard against it.

The insect is a new species of codling moth, Kakivoria flavofasciata. The larvae of the moth feed on the fruit of the persimmon. Its eggs are laid on twigs and the possibility of such twigs bearing eggs being introduced into California is pointed out by Dr. Swingle. This information is valuable in that it will result in an effort to prevent either of these pests from gaining a foothold in our state.

SUMMER PRUNING OF VINES

REGARDING inducing heavier bearing of vines Professor Bioletti says:

"First, longer pruning should be tried. Vines which have been pruned to spurs of two buds should be given three or four. If this does not cure the trouble cane pruning should be tried. Bowing the canes or tying them to horizontal wires may be helpful.

"Next, the perfect maturing of the wood in autumn should be promoted by ceasing cultivation and irrigation early enough to stop the new growth sometime before the early winter frosts commence. The canes should stop growing just about the time the crop is gathered. Late pruning is sometimes effective by delaying the blossoming. A delay of a week or ten days in the time of blossoming can often be brought about by pruning after the end buds of the canes have started. This makes it more likely that the weather will be warmer and more favorable to setting during blossoming.

"Various methods of summer pruning may be tried. These are all more or less weakening and should be used with discretion.

"The setting of the blossoms can often be much improved by 'pinching.' This consists in removing the extreme tip of the growing shoot with finger and thumb. It is done when the shoots are about 18 inches long and

when the bunches of unopened blossoms are well in evidence.

"More severe summer pruning later in the season is sometimes effective in promoting the formation of fruit buds for the following year. This is called 'topping.' This consists in cutting off the ends, one or two feet, of vigorously growing shoots in June or July. It should not be done in excess and only with very vigorous vines.

"Finally 'ringing' may be resorted to in special cases. This consists usually in removing a ring of bark about one-eighth inch wide from the cane just below a bunch. Its object is to hasten the ripening and increase the size of the grapes. Ringing an arm or even the whole vine in a smaller way may hasten the maturing of the wood and the formation of fruit buds for the following year. This form of ringing should be done late in July or August, according to the locality. It can only be used with excessively vigorous varieties, such as the Black Corinth. Most varieties would quickly succumb to this treatment."

Sulphuring

SUN-MAID Herald says. "The use of a tin can shaker or a cloth sack is to be emphatically discouraged. An experienced vineyardist said recently that many men in sulphuring like to see the sulphur on the vine. This is not only not necessary but its visible presence is no proof that the vine is well protected. Some form of knapsack blower is found to be by far the most satisfactory instrument for application. This blows very fine particles into all parts of the vine, and the more invisible the fine particles are the better distributed they are and the more likely they are to be effective.

"It is also a fatal mistake to wait for the appearance of mildew. The fungus is at work long before the killing is apparent, and may be feeding on the sap of the vine and weakening it and the fruit. It may become so severe as to lower the vitality and finally kill the vine. Two or three sulphurings at the right time are cheap insurance against loss from this, the most severe disease to be contended with in California. The disease has few terrors for the farmer who watches his sulphuring with care.

"'California farmers are indeed fortunate that they have none of the many diseases found in the vineyards of Europe,' said a university expert recently. 'They need not fear mildew if they sulphur. And sulphuring costs very little if applied in the proper manner'."

California Cured Fruit Exchange Settlement

Secretary-Cashier Wm. Jas. Hill of the California Cured Fruit Exchange writes:

"It may interest your readers who were members of the Exchange and therefore sufferers in the case, to know that at Walker's request the civil action has been settled by agreement out of court, and I enclose a statement showing the conditions of the settlement.

"The agreement was signed on the 12th of april. By it Walker dismissed his action against the Exchange in which he claimed over $96,000 and for which he attached the Exchange property in February of last year.

'Released the trust deed which he held and all attachments on the Exchange property and money, allowed about $15,000 received for fruit sold to apply on Exchange notes held by the bank as an innocent third party and also about $2000 lying to Walker's credit in a city bank, which the Exchange had attached.

'The agreement also provides that if the Exchange finds within five years that Walker's statements are untrue as to his having no property, the agreement is void and the Exchange may take legal proceedings to collect.

'The 1270 fruit growers who compose the Exchange are left guessing as to what has become of the difference between the $98,000 missing and the $17,000 collected, and will probably long remember with mingled feelings of sorrow and regret their late secretary-cashier, Mr. Samuel Otis Walker.

'The Exchange held a bond in a reliable surety office for $20,000 which they expected to collect, but find in the application form used Walker's duties are described as filling in printed forms, etc. He failed to describe himself as secretary-cashier, or as solely responsible for the books and accounts.' "

Cabbage Worms

INQUIRIES are often made regarding control of the cabbage worm. Regarding this pest we quote from Essig's "Injurious and Beneficial Insects of California":

"Life History.—In the northern part of the state the species winters over in the pupal stage, while in the south adult butterflies may be seen almost any time of the year. They become very much in evidence early in March and are active throughout the entire summer and fall. Egg laying begins soon after the adults leave the pupal stage. The eggs hatch in about a week and the young caterpillars begin feeding at once. They first feed upon the outer leaves, making them ragged and full of holes, but gradually work through towards the heart of the cabbage, leaving the dark green excrement to mark their paths of destruction. The growth is very rapid, so that in from one to two weeks they are ready to select some secluded spot beneath an old cabbage leaf or some nearby object and prepare for the pupal stage which, during the first two generations in the summer months, lasts little longer than the larval stage, but which in the fall continues throughout the winter. There are several generations a year. In fact, in the southern part of the state it seems as if the breeding is only slightly checked during the winter months."

Regarding the control of the pest Mr. Essig says: "The larvae, working as they do into the heads of the cabbages, make control measures practically impossible after they have once begun. Young plants may well be protected by arsenical sprays, which are applied with safety until the heads are half grown. Clean culture should

a citrus spray that makes good

After work of several years in groves and laboratories our staff—Entomologist, Chemist, Practical Growers—have evolved for us on citrus trees a spray that will successfully and satisfactorily controly insect pests at a cost much smaller than is possible with any other method of control.

TRIUMPH, a concentrated oil spray perfected by our staff, combined with Bordeaux, makes this citrus tree spray. If applied in accordance with our formulas, this combination spray of Triumph and Bordeaux is a beneficial fungicide as well as an effective insecticide.

Triumph with Bordeaux improves the general health of a tree and is safer in regard to spotting of fruit and tree injury than is a straight insecticide.

TRIUMPH with Bordeaux can be applied NOW, this summer, before insects do their damage.

There is no uncertainty about the supply or price. Stocks are on hand in Los Angeles and San Francisco. Shipments will be made at prices we shall be glad to quote upon application.

TRIUMPH with Bordeaux has been proved out by scientific laboratory tests and actual work in groves. It is not a "shot-gun" prescription.

Our new book, "Spraying of Citrus Trees" is full of money-making, new, accurate information. It also contains formulas and tables for the application of TRIUMPH.

Give us your name and size of your grove and we shall be glad to mail you a copy free. Address Box C, Insecticide Department,

War means more acres tilled -at less cost per acre

The nation is turning to the farm business man.

During the months that are to come, *he* is the one who must solve the problem of bigger and better crops, more intensive and extensive farming, *at less cost per acre.* It is these problems which the

TRACFORD **$125** F.O.B. DETROIT

"The Tractor Universal"

will help to solve to the greatest profit and satisfaction of the western fruit grower and orchard man—the man who wants power equipment at less than big-tractor expense.

The TRACFORD attachment is converting thousands of farm-owned Fords into *practical, light tractors splendidly adapted for orchard work.* It is ample in power—and as economical in operation as the Ford car itself.

With a TRACFORD, you can plow "to" and "away" from the trees—avoid packing the ground on account of its light weight—and turn in an unusually short radius due to the location of the dead axle in advance of the Ford axle—an exclusive TRACFORD feature.

"The Tracford Catechism" answers every question you may want to ask. Send for it.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Bermuda Infesting Alfalfa

A large acreage in this section of the state which was formerly covered with thrifty alfalfa, on account of the rapid growth of Bermuda grass, wire grass, salt grass, etc., has been abandoned for the growing of alfalfa, the owners stating that if the land is plowed and reseeded the Bermuda and other grasses will again choke out the alfalfa within a period of two years. Can not such fields be treated so as to effectively kill out grasses, or at least hold them in check so the alfalfa can be grown with profit?—Subscriber, Lordsburg.

Here is a case where clean culture of the land would be required for a couple of years and this of all years is perhaps one of the best because of the demand for more grains and other food and stock feed products. Milo, feterita or any of the grain sorghums planted on such ground should yield immensely, and such crops enable clean culture which would kill out Bermuda or other foul grasses. Then there are sugar beets, beans, sweet corn or field corn, or other crops which may be grown on this land. As noted in the inquiry, alfalfa planted on this same soil without the interval of clean culture would only result in the weeds taking the crop.

Lice on Potatoes

Have a fine looking patch of potatoes which are becoming infested with green lice. Are these harmful and, if so, what would you recommend as a spray for their control?—Subscriber, Berkeley.

Tobacco dust or spray with kerosene emulsion, tobacco extract diluted in water, or any of the milder insect sprays. It will probably be necessary to keep up the treatment for they are persistent in coming back. They are most decidedly harmful if allowed to remain.

Morning-glory

The best remedy for this pest is a sharp cultivator. After it is brought partially under control weed cutters should be run over the patch regularly once a week. Use the cultivator only on the one patch, being careful not to drag any particles of the roots to other sections of the place. Chemicals such as salt, arsenicals and proprietary mixtures are sometimes employed, but some of them prove injurious to the soil, preventing growth of other crops for a period of months or years. The cultivator method is absolutely sure and benefits the soil, but it must be continued persistently.

Blackbirds

How can one wage a successful campaign against blackbirds?—Subscriber.

A subscriber recently came to the office with a suggestion along this line which will be described more fully later. In effect it is the use of the small mouse trap with a spring which flies over and pins down the head of Mr. Mouse. This spring is supplied with a small cardboard pan easily attached, and in this is placed fine gravel so that when the birds light on it, partially concealed, t spring is released and the sm gravel is catapulted against the bun of birds. If several of these tra are set it will frighten away many the birds. The gun is also satisfa tory but expensive. A short gu campaign frightens the birds and partially effective. Poisons are har ly to be recommended because of t innocent birds which are also d stroyed.

Lemon Variety

We have ten-year-old lemon trees i orchard and would like to know v riety. Are they Eureka or some othe kind?—Subscriber, San Gabriel.

If the trees are not very large, a thornless and heavy bearers with fa ly compact head, presumably they ar the Eureka. If larger growing, thorn not so free in bearing but almos every lemon is a typical lemon shap then they may be the Lisbon. An e perienced lemon grower can give i formation on this point.

Pruning Evergreen Shrubs

Which is the best time for prunin evergreen shrubs, such as the pitto porum, laurustine, etc? Subscribe San Gabriel.

A fairly safe rule is to prune suc shrub soon after blossoming. Eithe may be pruned severely any time du ing the earlier summer season.

Liver Trouble

My hens (one and two years old) are dying just as they finish thei litter, and I don't know what to do fo them. They get sick and sit aroun a couple of days and then die. I hav opened several of them and found the liver enlarged and the bowels floatin in blood and bloody water. I fee milo and rolled barley and oats. Have plenty of green stuff, plenty of grave and fresh water. Have been in the chicken business for years and never had this experience before. Can you tell me a remedy? — Subscriber, Nestor.

Your hens are dying of liver trouble, probably due to the unbalanced ration they have been receiving. You speak of feeding rolled barley and oats, both of which are hard to digest because of the hulls, and make no mention of meat in any form or of ground grain. The lack of these forces the hens to eat more of the scratch grain than they should; very likely they do not get exercise enough in scratching for it; gizzard and intestines become clogged and sluggish in their action; the liver is enlarged, the circulation obstructed. In most cases the intestines are covered with fat. When the hens are in this condition the strain of laying an egg may rupture the softened liver, and death follows.

The cause suggests the cure. Feed a bulky mash, largely bran, which is quite laxative. Feed greens liberally. Cut out either oats or barley, and feed the grain you do feed sprouted. If the hens are fat it would be a good plan to turn them out on range for a while. If this is good and green they will get on nicely without any other feed for a week or so, though of course such a course as this will probably check their laying. If you do not turn them out, give a moist mash of bran and cooked vegetables

(or vegetable skins) in the morning, all the green feed they will eat during the day, and sprouted oats or a little milo at night. And make them scratch for every bit of grain they get. A dose of Epsom salts all round might be given once a week for several weeks, or until all the combs have turned bright red and every hen seems in tip-top condition. Mix the salts (about half a teaspoon for each hen) in moist mash in the morning when the hens are hungry, and give no more than they will eat up clean. This helps in cleansing the system. Many poultrymen give Epsom salts regularly in the spring whether their hens are sick or not.—J. A. K.

Tomato Blight

I have a piece of ground which was ast year planted to tomatoes but on ccount of wet weather they became ffected with blight. I plowed under he vines and would like to again this ear plant the same plot to tomatoes. Would this be advisable, or would here be danger of the new crop be- oming affected? — Subscriber, Ana- eim.

If, as stated, the blight came as the esult of wet or cool weather it is prob- bly the fall blight which is usually ontrolled by the use of a weak Bor- leaux mixture, and if other equally as ood ground is not available then e would surely plant and expect to ontrol by spraying. The Cultivator as given in former numbers this ormula and will do so again before he danger period of this fall comes. f, however, the blight was the fusar- um or summer wilt type this trouble annot be controlled by spraying and he bacteria now existing in the soil a hold-over from the former crop robably would infest the new plant- ng.

Veterinary

Answers in this column by Dr. Wm. etrie, 2714 South Harvard Blvd., Los ngeles, are without charge. For im- ediate mail answer remit $1.00. In riting questions give full symptoms or articulars of injury of animal. Unsigned communications receive no ttention.

yspepsia (Depraved Appetite)

Please tell me through the Culti- ator what is wrong with my cows at will chew paper or wood. I have ried everything I can think of and do ot know what to do next. She is fed reen feed, beets, carrots and bean raw. She also has a lump of salt go to at any time.—Subscriber, arden Grove.

This condition is not common but seen occasionally in animals that e kept on one kind of feed for a long me. The gnawing in the stomach comes chronic and the taste of sin in the wood seems to satisfy it. ive eight ounces of turpentine, two nces of aloin and two quarts of raw nseed oil. Mix and divide into four ses. Give one dose every two or ree days as a drench. Change the ed entirely and give nothing but dry y. Tie her where she can get noth- g else and feed her often and only a ttle at a time. After the other medi- ne is all used get some powders of ntian four ounces, nux vomica two nces, bicarbonate of soda three nces and farina to make one pound. ix and divide into 12 powders. Give ne once a day.

umor on Face

In the Cultivator of December 23, 916, on page 625, I described a trou- e with one of my mares, that was agnosed as bleeding wart. That trou- e is healed all right, but now there a bunch under the eye the size of alf a very large walnut, and the velling extends along under the eye e full length of the eye. It is hard and is all under the skin. Please tell me what to do for it now.—Subscriber, Santa Ynez.

Am inclined to believe that the trouble was caused by a small thorn puncturing the skin and a portion of it breaking off. Remaining there it has become encysted and a tumor is growing around it. Split the skin and peel out the whole bunch. Do not remove any of the skin. Then wet the parts once a day with a solution of permanganate of potash, one dram to the pint of water.

Throat Disease in Calves

Small calves have some kind of a throat disease that evidently is contagious and that has proved fatal in two cases. The calf's throat or jaw swells on one or both sides and seems to be very sore. The calf slobbers a great deal, and when one of the largest lumps was lanced deeply a white pus ran out of it. What is the disease and can anything be done for the calves?—Subscriber, Canby.

It is uncommon and we know nothing about it. Until we can give better answer clean up the place well, using plenty of carbolic acid. Burn all litter and the carcases of those that die. It acts like distemper of horses but that is not supposed to attack cattle. If it continues write us again.

Sore Teats

Have a cow that has sore teats most all the year. Have always used vaseline but with no results. Why is it so and what is best to do for it?—Subscriber, Soledad.

Try oxide of zinc ointment or if your druggist does not have any that is fresh get a box of Resinole ointment.

Tape Worm

Will remedy given in Cultivator of April 28 for wormy horses be successful if used for tapeworm in horses?—Subscriber, Blythe.

Yes, the formula is all right, but if I suspected tape worm I would double the amount of areca nut and try to give the medicine on an empty stomach.

Skin Disease in Dog

Will the treatment given for "Skin Disease in Horse" in the Cultivator of March 24 be all right for skin disease of a dog, and what amount of the medicines should be given to a dog the size of a collie?—Subscriber, San Anselmo.

The treatment for the dog should be somewhat changed. Half a teaspoon of the salts every morning for a week would be enough and five drops of Fowler's solution of arsenic would be about the right dose. For the outside wet the skin once a day with a strong solution of permanganate of potash. If it makes the skin look rough apply a little engine oil to keep it from cracking.

Mammitis (Inflammation of Udder)

I have a five-year-old Jersey that has an infected udder. About two weeks ago she began giving thick ropy milk from one teat and the quarter of the udder began swelling. Later the milk became bloody and is drying up but the swelling does not leave the udder, and it is sore to the touch. Have been rubbing it with camphor and oil and have also painted it with iodine but it does not improve. She has been milking about five months and is running on grass. Am still milking her but the milk is not good. She will be fresh in October. Will she get well if I turn her dry or what can I do for her?—Subscriber, Gridley.

Your treatment has been all right for the outside but you must not stop milking her. Milk her three or four times a day and rub the swollen parts for some time with the hands and work out everything that is in the quarter. She should also have a physic. Take one pound of epsom salts, half a pound of common salt and half an ounce of powdered nux vomica. Dissolve it all in two quarts of hot water and when cool give it all to the cow as a drench. Following this get your druggist to prepare this prescription: Iodide of potash four ounces, Fleming's tincture of aconite two ounces and water enough to make one quart. Mix. Give one ounce on the tongue once a day. It will last a month. In spite of all you can do you may still lose the quarter but it will probably prevent the trouble spreading to the rest of the udder.

Garget

Is there any connection between garget and small lumps on folds of the skin that lay next to the brisket? Cow drinks very little water and we do not think she is giving enough milk. Have given her poke root. As long as the lumps remain is it a sign that she is not cured of garget?—Subscriber, La Mesa.

There can be no connection between lumps in the skin at the brisket and garget. Give her the following treatment and the lumps will probably leave in a short time. Mix three pounds of epsom salts, two pounds of common salt and two ounces of powdered nux vomica and give her a handful of the mixture in the feed once a day.

BOTH BLADES CUT

The Scientifically made Dexter Tree Pruner

ABSOLUTELY THE BEST EVER PRODUCED

DEXTER TREE PRUNER

THIS IS WHY Most tree pruners have one cutting edge. The DEXTER has TWO, running parallel so you are SURE TO GET A CLEAN CUT EVERY TIME with the grain of the wood PRESSED TOGETHER with tree limb uninjured. THE DEXTER TREE PRUNER (made in three sizes) will cut any tree limb that the knives will span and will cut it square off, close up or at any angle. Because of the clean job the wound will heal over much quicker than if torn or split. Each knife made of best tempered steel, castings strong and substantial. California orchardists say it is the best they ever saw. Descriptive circular sent on request. Three sizes, $4.00, $5.00, $7.50.

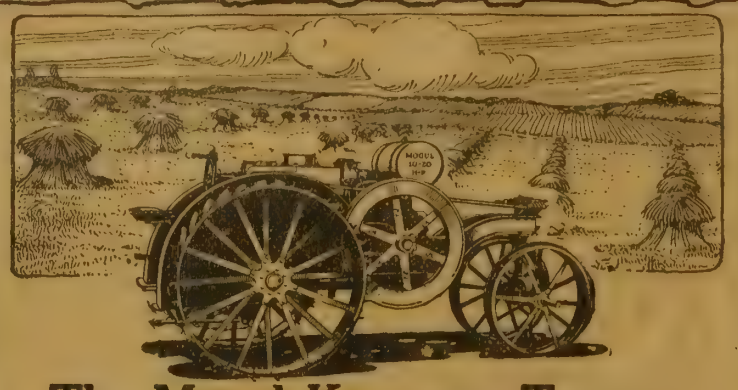
C. S. Anthony, 1047 South Olive St. LOS ANGELES



The Mogul Kerosene Tractor in a New Size

IN 1915 we introduced the Mogul kerosene tractor in a two-plow size. It met with instant and continued approval, so much so that it has far outsold all other tractors of its rated horse power put together.

We now offer Mogul 10-20, the same popular and efficient type as Mogul 8-16, enlarged, improved, built to draw three plows instead of two. No changes have been made in design except the few indicated by experience, or made necessary by the higher power.

The engine is larger, but it is the same efficient, slow moving, kerosene-burning type. The transmission is changed to give two forward speeds instead of one. **Mogul 10-20** travels 1.8 and 2.5 miles per hour. The same simple, safe chain drive is used, the same good force feed mechanical oiler. In all essentials **Mogul 10-20** is the reliable, dependable, economical Mogul tractor you have heard so much about from your neighbors, or know so well by experience.

Booklets and folders with full descriptions of the new **Mogul 10-20** are now ready and will be sent by return mail on request. When you write for them, address

Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her FREE Homestead lands of 160 acres each or secure some of the low priced lands in Manitoba, Saskatchewan and Alberta. This year wheat is higher but Canadian land just as cheap, so the opportunity is more attractive than ever. Canada wants you to help feed the world by tilling some of her fertile soil—land similar to that which during many years has averaged 20 to 45 bushels of wheat to the acre. Think of the money you can make with wheat at over $2 per bu. and land so easy to get. Wonderful yields also of Oats, Barley and Flax. Mixed farming in Western Canada is as profitable an industry as grain growing.

The Government this year is asking farmers to put increased acreage into grain. There is now a great demand for farm laborers to replace the many young men who have valunteered for service in the war. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or to

Irises in the Southwest

THE iris or flag, fleur de lis of the French, is among the oldest of our cultivated flowers, writes J. J. Thornber in California Garden. He says: "Its name, signifying 'rainbow', was given to it by the Greeks. The iris is related bontanically to orchids on one side and to the amaryllis and lilies on the other. It is a favorite flower with the Japanese.

"Irises constitute one of our largest groups of hardy perennial flowers; there are in cultivation now more than 100 species, with varieties almost too numerous to mention. When once established an iris bed should not be disturbed any more than is necessary, since ordinarily the plants do not blossom well the first year after being set.

"Because of their general hardiness, and especially the drought resistant qualities of a large number of them, particularly the German irises, they are admirably adapted for planting in Southwestern gardens. There are few flowers that are as uniformly successful in Arizona, with its wide range of growing conditions, as the iris. They can endure some alkali, strong light, thrive in heavy or light soils, grow with much or little irrigation and endure prolonged drought and heat. With their surface growing rhizomes they can even tolerate poor drainage. To be moderately successful, they require only the most ordinary culture. On account of the ease and success with which they grow, they should find a place in every garden. It is interesting to know that a number of rare irises from Palestine and Syria which are grown with difficulty in the Eastern states, blossom and come to perfection in the mild climates of Arizona and California.

"The writer knows of plants that have grown for several years on dry Arizona mesas with only the scant rainfall and the occasional flood water that collected in the basins surrounding them. In the heavy red clay soil in the cemetery of one of our larger Arizona mining towns, irises are much planted and succeed beyond expectation. When established there, they grow and blossom year after year with little care, and they have come to be known to the children as "Easter lilies." I know of no other flower that would thrive so well under the same trying conditions.

"Irises are used to advantage in many kinds of planting, including massing, setting along borders of walks and drives, and also for naturalizing in back yards, in woods and along brooks. With their showy flowers and strict habit of growth, they are excellent for formal bedding and they lend themselves well to artistic effects. In addition to irises heretofore mentioned should be noted the several dwarf irises which are splendid for low borders, and the Spanish and English irises, the two latter bulbous species indigenous to Spain."

The Honey Harvest and Its Problems

Written for California Cultivator By Henry Perkins

NOW is the time for the California bee man to be Johnny-on-the-spot with his cup right side up if he is to get that big honey crop. The difference between a big crop and a fair one is often due to the difference in management and manipulation rather than to location and stock.

One of the first essentials to a big crop is strong colonies. Don't let them swarm in the middle of the honey flow. If you do your crop is cut squarely in half. Swarming during the honey flow is more prevalent some years than others. Different races and strains of bees exhibit different tendencies in this direction. The Italians are least of all subject to it, but they all need watching until the second or third extracting is over. This is especially true if spring swarming has been backward.

The best way to forestall late swarming is to give the bees plenty of room and plenty of ventilation. Put on two supers or even three if the colony is very strong. A full width entrance five-eighths of an inch deep is none too much. A congested and overheated condition of the hive is the most prolific cause of swarming during the honey flow.

If you use queen excluders place them between the second and third story till all danger of swarming is past. That will give the queen abundance of room to lay. A large supply of brood on May 20 means a large force of workers by June 15. In addition to this it is necessary to keep watch for indications of swarming.

Preventing Swarming

When a colony is found to be constructing queen cells it is time for the bee man to get busy and knock the notion out of their heads. There are so many ways of doing this that I will only describe the method which I have used with the greatest degree of success. It is called the shifting method. I shift colonies, putting the strong colonies on the stands of the weak ones and vice versa. This can only be safely done when honey is coming in readily, and then only toward the close of the day, say three o'clock in the afternoon. The method in detail is as follows. Go through your yard and inspect all colonies which you suspect of swarming intentions. Mark any hive found to be making preparations. Likewise mark all very weak hives. If the excessively strong outnumber the weak it will be necessary to create enough through frame nuclei to bring the number of weak up to that of the very strong. Then in the middle of the afternoon of a bright day reverse the positions of each grade of colonies, placing the strong ones on the stands occupied by the weak and the weak ones on the stands occupied by the strong. Be sure to blow smoke into the entrance of each at the time the transfer takes place. Care should be taken that the hives in every case are moved at least two rods from their original stand. A general killing of bees will not result. It seems that a bee laden with honey and pollen is not always looked upon as a robber, and is therefore reasonably sure of admission into any hive even though that hive has not been confused by a sudden change of position. The confusion due to the change and the smoke seems to prevent in almost every case the loss by fighting which so often occurs when strange bees are suddenly thrown together in the same hive.

Now the effect of this procedure as related to the swarming problem will be readily understood. It reduces the force of field bees in the strong and strengthens the hands of the weak, yet it does not cripple the strong ones for the balance of the season as casting a prime swarm surely does.

If when inspecting for swarming preparations I discover a hive with sealed or well advanced queen cells I always make it a point to destroy them and in addition to the shifting treatment above described I also take away at least two combs of sealed brood and give it to one of the weaker stands. When a colony has so far matured its plans to swarm as to have sealed queen cells, or even cells well advanced in the larval stage, they are loath to abandon the idea, and a more vigorous preventive treatment must be used than would otherwise be necessary. Swarming is the active exercise of the bees' natural instinct for increasing by establishing a new

At the bottom of your letter to advertisers just say "California Cultivator" and prompt reply is assured.

colony. When it once gets a firm hold on the collective mind of the colony it is about as hard to overcome as it is to break up a sitting hen.

Keep Bees Busy

The next point I wish to mention is: Don't let your bees get honey bound. Just as sure as you let them run short of room you are provoking swarming. The minute a colony is compelled to loaf for lack of room to store honey it will begin plans for a new home and more room. Then the bees will fill every cell in the hive with honey, leaving no place for the queen to lay. By all means keep the extractor going and keep plenty of empty comb ahead of the bees.

Right here I want to mention the great advantage of having plenty of supers and combs. There is no better investment for the bee man than at least two supers for every hive he owns. It is so often the case that bees will under favorable conditions store honey a third faster than they can ripen it. At such times if they are only furnished with one super it is obvious that the gatherting must cease for several days while the honey is being sufficiently ripened to extract. During this period an additional super would easily be partly filled without retarding the ripening process in the least.

In Arizona and Imperial

In Imperial Valley and certain parts of Arizona bees are not much inclined to swarm. In fact I have often found it necessary in those sections to resort to artificial means of increase to keep a yard up to its number.

I have found it a good practice to form a number of three frame nuclei at the beginning of the honey flow unless a large part of my colonies were already very weak. They fulfill a twofold purpose. They take care of the demand for a reasonable amount of increase as well as furnish a means of disposing of the surplus strength of the strong colonies, which must be reduced to prevent swarming.

To Insure Ripened Honey

I want to say a word or two about old brood chamber combs in the supers. A comb that has been used for brood rearing one or more seasons will flavor the honey stored in it for a number of extractings. Some claim that brood chamber combs also darken white honey. I am not so sure on that point but I do know that the brood chamber taste and smell will stick to them for a long time. If your location produces a dark honey it is not of so much importance to safeguard the flavor. On the other hand if your honey is white the flavor has an important bearing on its price. The lighter honeys are used largely for table purposes, while the darker grades are consumed by the bakers and other manufacturers.

What is true of the color and flavor of white honey also applies to its body. Your honey may grade water white, but if it is thin and watery it will not command a first class price. Don't extract it too green. Better let the bees finish the job of ripening and sealing. You can do this without loss if you supply them with an extra super or two in which to store while the first one is being thoroughly ripened. Some beekeepers maintain that every cell should be sealed before it is ready to extract. The different locations produce honeys which differ in this respect. It should be thick and ropy, that is a satisfactory test irrespective of whether it is sealed or not.

Better Honey—Better Prices

It is a bad practice to extract combs that are partly filled with unsealed brood. Lots of it will be thrown out by the extractor and be mangled and mixed with the honey. It is a fact that the lack of uniformity in the flavor, body and color of the average honey is to a great extent responsible for the low price it brings in competition with the more inferior though more uniform syrups. True it is that the items of color and flavor are largely due to seasonal conditions and locality, yet the producer can do a whole lot to improve the price of his product by improving its quality. A buyer once told me that he would be glad to pay me a cent above the market for my honey if he knew where he could buy enough more like it to make out a carload. Because he could not I was obliged to sell for the same price as the man whose honey was inferior.

IN the Middle Atlantic States where farm genius succeeds at everything from fruit growing to dairying, from intensive trucking to the most diversified of general farming, Firestone Tires are held in high respect.

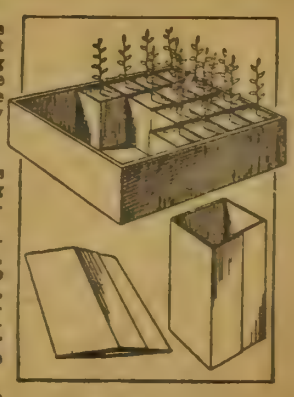
THE EXPAN CO., 935 E. Central Ave., Redlands, Cal.



The Bull We Choose!

IT

IT

IT

We Had Our Ideal, Set Out to Secure its Fulfillment and Obtained "It"

"It" at age of four years represents a culmination of breeding, individuality and opportunity such as no other bull in the world at his age has ever been able to obtain. He surpasses all other bulls in the West in the following respects:

I. "It's" dam, Pontiac Clothilde De Kol 2d, has the highest record from seven days to a year of the dam of any bull in the West. She was the first cow to make 37 lbs. butter in 7 days, 145 lbs. in 30 days and 1271 lbs. in a year.

II. His sire, King Korndyke Hengerveld Ormsby, has 40 A. R. O. daughters including the world's champion cow with first calf for 30 days' production. His daughters are all young and in good hands and he will undoubtedly have eventually a dozen 30-lb. daughters.

III. "It's" sire is a full brother to a cow that has made over 1000 lbs. fat in a year. "It" is therefore the only bull in the world that inherits 100 per cent of his blood from two cows that have each produced over 1000 lbs. fat in a year.

IV. His sire's dam, Pietertje Maid Ormsby, has twice broken the world's record for butter in her class for 30 days' production, making the last time 35.56 lbs. butter in 7 days and 145.66 lbs. in 30 days.

V. His dam, Pontiac Clothilde De Kol 2d, is the most noted cow that has ever lived. Practically every great young bull today is either descended from her or is closely related. Her sons are more famous than those of any other cow. Her grandsons include the highest priced dairy animals in the world, being headed by the $50,000 bull, the $35,000 bull and the $20,000 bull calf.

"It's" sire's dam, Pietertje Maid Ormsby, is also a great transmitting cow, having more high yearly record and great show ring winners among her granddaughters than any other cow in the world.

VI. The average of the seven and 30-day records of the two nearest dams of "It" were world's record averages in 1912 and 1913 and are still unequaled by any other bull in the West.

VII. The opportunity that "It" has had in the last four years surpasses that of any other bull of the breed. He will have within a few months 100 living daughters, practically all out of the daughters of King of the Pontiacs, the greatest sire in the world, one-fourth of whom will have 30-lb. records.

We intend to give "It" the best opportunity of any bull in the West, as he will be bred to more 30 lb. cows, 25-lb. cows, A. R. O. cows and 20-lb. two-year-olds than any other bull on the Pacific Coast.

VIII. The first five daughters of "It" to freshen average almost 21 lbs. butter for seven days. One in the hands of a small breeder with no previous experience in making records made 23.92 lbs. of butter, while another gave over 21 lbs. butter. All as 2-year-olds.

IX. The individuality of the offspring of "It" place them in a class by themselves. They all show straight top lines, great constitution and wonderful quality.

For Sale—Owing to the fact that we have bought "It" we offer our two young herd sires for sale at a great sacrifice. They are both just past two years of age, are evenly marked and are splendid individuals. One is a son of King Korndyke Sadie Vale, whose three nearest dams average over 33 lbs. butter and which we think will soon be greatly increased and the other is a son of Winnie Korndyke Cornucopia De Kol, the only cow in the world to make over 31,000 lbs. milk and 1200 lbs. butter in a year. We have also a number of young bulls for sale out of high record dams. Inquiries invited.

McAlister & Sons - Chino, Cal.

California Butter and Cheese Scoring Contest

By H. S. Baird

SCORING contest was held at Fresno May 2 under direction of University of California. The management of the contest is withholding names and locations of contestants excepting where permission is given to use the name. The only name announced is that of Ed Hooper, Spreckels Market Creamery, San Francisco, with butter score of 92½. Other scores range from 90¾ to 94¾; scores on Cheddar cheese, 90 to 93½; California cheese, 91½ to 93; Jack cheese, 89 to 92½.

Twenty-five cubes of butter and 11 cheese were entered in this second scoring. Five buttermakers were present during the scoring. After the judges had placed their scores the buttermakers went over the samples after which their scores were compared with those of the judges.

Hans Beck of the Danish Creamery, Fresno, received the highest score on butter with 94¾. High scores on cheese were as follows: Cheddar—Arthur Schoenrock, White & Terry Cheese Factory, Galt, 93½; California (Granular), Ray Weedmark, University Farm, Davis, 93; Jack, C. Basciarini, 92½.

The scoring was done by T. J. Harris, Official Inspector of the San Francisco Wholesale Dairy Produce Exchange; H. S. Baird and S. L. Denning of the Dairy Division.

Butter of Good Quality

S. L. Denning, who was one of the judges, makes the following comment on the butter:

"The average score of the 25 cubes of butter entered was 92.5. This average again raises the high mark for our scorings; 92.38, the average for the last scoring which was the highest average during the last two years, is now surpassed .12 by this scoring. Thirty-two per cent of the entries scored 93 or above. The lowest score was 90.75. A few of the entries showed the use of some old cream and several were criticised for having a neutralizer flavor. The feed flavor was again common and in some entries very pronounced. The body in this scoring was a big improvement over that of the last scoring. Although a few entries had weak, leaky body, the majority were very good.

There was a big variation in the color of the entries with almost any shade from pure white up to a bright yellow. Probably some of the buttermakers do not realize the importance of having the butter of the proper color. A butter too light or too dark must stand a severe cut when sold on the market. Several of the entries were mottled and a few contained grit. Both of these faults can be easily remedied by a little more working. A few of the entries were excessively high in salt.

The cubes showed a wide variation as to size, shape and general appearance. Most of the boxes were very neat and showed a great deal of work and care in their preparation, but a few were very rough in appearance. The package often gives the judge or buyer his first impression of the product and it is generally an index to the workmanship of the butter. Mr. Harris, one of the judges, spoke of the irregularity of the package and said that he is cutting very severely on the market when butter appears in ill sized and poorly made packages. In the next scorings the package will be watched more closely and cuts made when necessary."

Cheese Has Poor Texture

The average score on all cheese entered was 91.68. The average score on the different classes were as follows: Cheddar 91.9, California (Granular) 92.2, Jack 91.1. The principal criticisms on the Cheddar cheese was on texture and body. There was a wide variation in the criticisms on body and texture of this cheese; some were criticised for being soft and weak while others were cut for being dry and crumbly. The dryness may be caused by neglecting to cut down the percentage of starter for the "faster" spring milk or by not lowering the cooking temperature when the fats become softer with green feeds. The sticky, open and weak bodied cheese probably contained too much moisture. Two cheese were very highly colored, containing so much that they had a reddish tinge. This could not be accounted for unless it was due to failure to cut down on the rate of cheese color when the milk became higher colored, on account of green feeds. There were three or four Jack cheese entered which were undoubtedly made from half skim milk and were intended for "drying" cheese. It was our intention, when adding Jack cheese to the contest, to score Jack as "table" Jack, but if there is a sufficient number of "drying" Jack to make it practical we will make two classes of it and score them on a different basis. These cheese which were made from half skim were very tough and inclined to be dry. The most common defect in flavor on the Jack and California (Granular) was bitterness. This flavor very often accompanies a high moisture cheese and if it is to be avoided, nothing but the best quality of milk can be used.

The next scoring contest will be held about the first of July, notice of which will be sent to each contestant. Any one wishing information concerning the contest should address the Dairy Division, University Farm, Davis, California.

A RARE HOLSTEIN OFFERING

It is not often that a breeder can go out and buy a great sire and 15 of his daughters, the sort of group that carries the beginning breeder far forward in the development of his herd and saves him years of time. The scarcity of such groups makes the offering by The Greenbank Company, Seattle, Washington, in this issue, of particular interest. Their decision to sell Greenbank Farm is responsible for their decision to sell their great Holstein herd bull, King Korndyke Pietertje Pontiac, and 15 of his daughters. King Korndyke Pietertje Pontiac is sired by King of the Pontiacs, which is enough said for that side of his pedigree. His dam is a 26.30 pound three-year-old daughter of Beauty Pietertje Prince, who is also the sire of Prince Gelsche Walker, the present sensation among Holstein sires in California, and she is out of a 30-pound dam that was for many years the youngest 30-pound cow of the breed.

The 15 daughters of King Korndyke Pontiac range in age from six months to 18 months, and they are all out of splendidly bred dams, all with A.R.O. records, and some with great semi-official yearly records. These dams are sired by such bulls as King of the Pontiacs, Aaggie Cornucopia Crown De Kol, Vale Concordia De Kol Cornucopia, Sir Inyo Mercedes, Mutual Fobes Longfield De Kol, Sir Johanna Ruth Fayne, the latter being represented several times.

This is a good straight, clean group of cattle, and any man who puts them all in his herd can start right off with a top notch sire and a bunch of his daughters that will not be long in reaching milking age.

King Korndyke Pietertje Pontiac 127387
AND
15 of his Daughters are For Sale

His sire: KING OF THE PONTIACS, 200 A.R.O. daughters, which include 40-lb. daughters; more 30-lb. daughters; more 20-lb. daughters; more 20-lb. 2-year-old daughters; and more daughters with semi-official yearly records than have been sired by any other bull.

His dam: MAY KORNDYKE 2ND 139970, who as a 3-year-old made 544.7 lbs. milk and 26.30 lbs. butter in 7 days. As a 5-year-old she made a semi-official record of 18,868.9 lbs. milk and 776.46 lbs. butter in one year. She is sired by Beauty Pietertje Prince, the sire of Prince Gelsche Walker, whose daughters include the California junior 4-year-old record holder, Lady Hiske Walker, 34.24 lbs. butter in 7 days, and the world's record holder in the eight months after calving division, in the senior 2-year-old class Miss Valley Mead De Kol Walker, 404.2 lbs. milk and 21.33 lbs. butter in 7 days beginning 243 days from freshening. May Korndyke 2nd is out of May Korndyke, the first 30-lb. 3-year-old and for many years the youngest 3-year-old cow of the breed.

KING KORNDYKE PIETERTJE PONTIAC is a full brother to KING KORNDYKE PONTIAC, standing at the head of Mr. Fred W. Kiesel's good herd at Sacramento, Cal., and whose daughters will be given every opportunity to make a high place for themselves.

KING KORNDYKE PIETERTJE PONTIAC is a great individual, possessing great length, depth of body, straight top line, and carrying splendid quality. He is vigorous, a sure breeder, and has already sired a splendid lot of offspring.

THE 15 DAUGHTERS OF KING KORNDYKE PIETERTJE PONTIAC range in age from six months to eighteen months, and having been well fed and cared for are all good, large, growthy heifers, the kind that are rarely offered for sale. They are out of A.R.O. cows, some of which have semi-official yearly records up to 1000 pounds butter.

We are retiring from the dairy business, otherwise this great young sire and his daughters would not be offered for sale. We will gladly furnish further information and prices upon request.

Copies of the pedigrees of these animals are on file at 4-5 Labor Temple, Sacramento, the Sacramento office of California Cultivator, and interested parties are invited to inspect them there.

Why Europe Makes Bigger Crops Than the United States

Average Production of European Crops is as Follows:		Average Production of American Crops is as Follows:	
Wheat	33 bushels per acre	Wheat	14 bushels per acre
Oats	45 " "	Oats	40 " "
Potatoes	199.84 " "	Potatoes	97.15 " "
Cotton in Egypt	400 pounds "	Cotton	185 pounds "

European farmers use about 600 pounds to the acre of a Home-Mixed Nitrated Fertilizer containing 8 per cent of Phosphoric Acid and 4½ per cent of Nitrated or Nitratable Nitrogen.

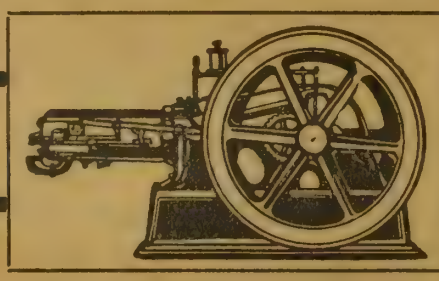
American farmers apply 200 pounds to the acre of a Fertilizer containing 8 per cent of Phosphoric Acid, together with 2 per cent of Nitrogen which is mostly unavailable.

The difference in results is largely due to the large amount of Nitrated Nitrogen used in Europe per acre as **Nitrate of Soda.** Our pitifully small American yields are due to failure to appreciate the necessity of using Nitrated Nitrogen.

Write for "What Nitrate Has Done in the Farmer's Own Hands"

Dr. WM. S. MYERS Director Chilean Nitrate Propaganda **25 Madison Ave., New York**

QUALITY IS THE BASIS OF COMMERCIAL ENGINE SUCCESS



LOW COST OF OPERATION

LOW COST OF UPKEEP

COMMERCIAL Engines are NOT an experiment. They have stood the test of years because they are honestly made down to the smallest bolt and nut. They combine ALL the essential features necessary to produce a perfect pumping engine. They are strong, simple in construction (having only 150 parts)—easy to operate, reliable, and backed by an ironclad written guarantee.

Our handsome new catalog will post you on all the details of Commercial Engine Construction. Write today for free copy.

When to Choose Certain Crops

By J. W. Gilmore

Sorghums

Sorghums are primarily dry land crops, although they respond to irrigation. They are planted after the soil becomes warm and dangers of severe cold are over.

The sorghums are most economically grown where they can be fed on the land where grown. The grain, however, has a market value, and is used largely for stock food.

During the growing season they should be cultivated as the destruction of weeds, the demands for moisture, and the maintenance of physical condition require.

Dwarf Milo

For earliest planting (latter part of April). Germinates under wider range of moisture and temperature than others.

On heaviest and lightest soils. More hardy under adverse soil conditions.

When in doubt as to value of other varieties; apparently the most generally adaptable.

Feterita

When bird damage to other varieties is expected. Birds seem to hold this variety in second choice.

When soil is in prime condition as to moisture and temperature. Feterita is less hardy than other varieties in this respect.

For mid-season planting (during May).

Egyptian Corn

For late planting.

Where moisture supply is very deficient.

Where forage is of little importance.

This variety is very similar to Milo in its adaptabilities and conditions of planting. It is not quite so hardy however, and is a little more subject to shattering.

Feterita With Its Attractive White Heads Makes a Beautiful and Profitable Field

Indian Corn

Where previous experience has proved its success. Indian corn is less adaptable to California climate than the grain sorghums.

Where summer temperatures are relatively warm and humid. Dry, hot winds often damage the crop severely.

Where irrigation is available. This crop requires more moisture than is usually available from rainfall only.

Corn is an excellent crop where it can be grown, for it produces more nutrients per acre than any other cereal. It can be most economically used when preserved as silage, as food for cattle.

Sudan Grass

Where moisture conditions are inadequate for the production of sorghums. Sudan grass will grow on a more restricted supply of moisture than the sorghums.

Where costs of harvesting must be reduced. Tonnage of forage can be produced at less expense than corn or sorghums.

Where annual crops are desired on land that would otherwise have to be summer fallowed.

Where alfalfa cannot be grown because of soil type or lack of water for irrigation.

Subsoiling and Commercial Fertilizers

By J. R. Mattern

IN a section of the country where commercial plant foods are used to such an extent as they are throughout our part of the Pacific Coast, the importance of maintaining the best possible soil condition cannot be emphasized too much. Five to eight hundred pounds of a successful mixture will give as much results on an acre of soil properly mellow and open as a full ton on soil compacted and harsh at any point within reach of the roots. In addition, the composition required is cheaper and easier supplied for the mellow soil. This is not an argument for the reduction of fertilizer applications, but a statement of the conditions necessary in order to secure the maximum results from an application of any amount.

Any soil except sand, very light loam or muck that is left in its natural unbroken condition, is bound to be somewhat puddled and clogged in the section below plow depth. Drainage through such subsoil is not good, yet a good deal of the plant food applied on the surface ultimately finds its way to depths below the first foot. Roots do not go down after it freely, especially to depths of three feet and more, because penetration is more or less difficult, and because conditions are uninviting to them. Much of the fertilizer that gravitates deeply into the soil therefore practically is lost.

Another source of loss not commonly reckoned with is the reversion of soluble plant food to insoluble forms, identical with the unavailable native plant food found in soils. It is a

A Bumper Crop Is Now Assured

proven fact that each acre on nearly every kind of soil contains tens of thousands of pounds of potash and phosphorus, which elements may be taken as illustrations. If this plant food material could be released fast enough there would be no need for any artificial fertilizer. The difficulty on the one hand is to release it by cultivation, and on the other—the point usually overlooked—to keep it in the soil in an available condition. The commercial plant foods we buy are largely soluble, but they are subject to the same changes as the native plant food once they are deposited in the ground.

The condition which keeps them in available forms is that where the moisture supply is maintained uniformly at about the right point. Whenever the soil dries out excessively considerable reversion occurs, which means that just so much plant food is lost, from a practical standpoint, forever.

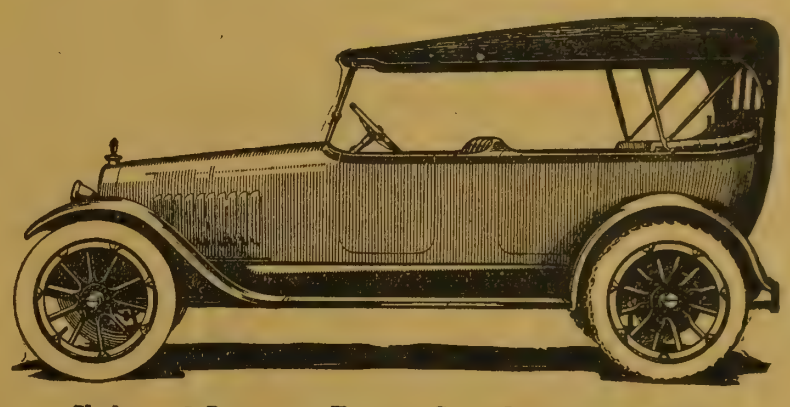
The direct loss of commercial plant food by leaching is the only one generally thought of. It is not large except on sloping and on all irrigated land. Hillsides lose enormous quantities of their fertility every year when there is any surface run-off at all. And there usually is. Irrigated land not subsoiled nearly always has that characteristic choked and compacted subsoil that is nearly impervious to water.

The man who wants to derive the full benefit from his commercial fertilizer applications will see to it that the soil is in a condition to receive, store and use them. The subsoil to a depth of three or four feet must be blasted open and loose to put it in a condition to do so, which is not difficult. Once this deeper soil is crumbled it will attract roots, accumulate humus, and, most important perhaps of all, will store and hold an abundant supply of moisture in capillary form. The trees or plants must have enough water for direct use and enough in addition for the indirect use which consists in making the "stone soup", which is the only form in which they can take up plant foods.

The maker of explosives has given this subject a good deal of study. It is a part of his business to promote the use of powder for subsoiling, hence his attitude is not disinterested, yet every agriculturist will find valuable information in their literature in which this matter of the relation between deep tillage and commercial fertilizers is discussed in a valuable manner. Numerous United States department of agriculture bulletins dealing with soil moisture supply, availability of plant foods and similar angles of the subject are equally interesting.

SHIP BUILDERS WANTED

The department of labor of the federal government has undertaken to assist the shipping board in its task of constructing wooden vessels, and to that end is endeavoring to secure experienced ship carpenters, shipwrights, bridge builders, dock workers, caulkers, etc. Congressman Osborne writes that he will be glad to aid anyone qualified to secure positions in this branch of the federal service. Write the congressman at the House of Representatives, Washington.



Chalmers 7-Passenger Touring Car—Price $1475 Detroit

Chalmers

Is Built For Long Service

Chalmers builds for long life. Sturdiness is in every part. Severe usage and hard going only serve to prove Chalmers construction.

The Chalmers is a light weight, roomy car. Light weight insures right road performance and true economy. Long springs give easy riding qualities both on good roads and in the ruts.

Go to the nearest Chalmers dealer. See a Chalmers. Examine the car feature by feature. See the beauty of the Chalmers lines. Note the fine body finish. The upholstery is genuine leather. The lamps are large and powerful. Point by point the Chalmers appeals to your good judgment.

Chalmers price is low for such quality. A cheap car is poor economy. A low priced, high grade, well performing car, such as the Chalmers is a genuine investment.

Ride in a Chalmers. You will then know its value.

Chalmers Motor Company
Detroit, Michigan

Tilly Alcartra

SCORES AGAIN

Milk 26,815; Butter 1040 pounds

The above figures are the result of her fifth consecutive yearly test, begun without rest and following a production of 29,826 and 30,451 pounds milk in the two previous years.

Beginning with first calf her records for five years for both milk and butter have never been equalled by any other cow of any breed, which distinguishes her as the

World's Champion Dairy Cow

Her records are as follow:

At 2 years 6 months (285 days)	Milk	14,837.2	Butter	549.33 Lbs.
At 3 years 5 months	Milk	21,421.3	Butter	841.22 Lbs.
At 5 years 1 month	Milk	30,451.4	Butter	1189.03 Lbs.
At 6 years 5 months	Milk	29,826.6	Butter	1190.46 Lbs.
At 7 years 7 months	Milk	26,815.0	Butter	1040.00 Lbs.
World's Record				
Total for 5 years		123,351.5		4810.04
Average per year		24,670.3		962.00

During the first four years Tilly Alcartra was awarded fourteen cash prizes by the Holstein-Friesian Association of America, amounting in all to $364.75, which as far as we have been able to ascertain has never been equalled by any other cow. During this time she was also debarred from one $40.00 first prize by the limitation rule.

She has produced three sons and two daughters. Two of her sons are at the head of large herds and having an excellent opportunity. Her first granddaughters are now coming in and making an excellent showing.

KING MORCO ALCARTRA

a son of this cow by SEGIS PONTIAC DE KOL BURKE, our herd sire out of RIVERSIDE SADIE DE KOL BURKE, is now in service in our herd. He is one of the greatest long distance bred bulls in the world and has all that could be desired in the way of type. His dam and sire's dam have the following average records—

Butter	7 days	32.26	Milk 842.9 Lbs.
Butter	30 days	128.42	Milk 3454.4 Lbs.
Butter	365 days	1137.79	Milk 29638.9 Lbs.
Butter	2 years	2222.33	Milk 57543.1 Lbs.

A few sons of KING MORCO ALCARTRA from high record splendidly bred dams are now available, also a limited number of young bulls by PRINCE GELSCHE WALKER and SEGIS PONTIAC DE KOL BURKE.

Information and pedigrees by request.

A. W. Morris & Sons Corporation

WOODLAND -:- CALIFORNIA

Articles of Association of California Holstein-Friesian Association

THESE articles were adopted at the special meeting of the California Holstein-Friesian Association, at Modesto, April 18, 1917.

Article I.—This organization shall be known as the California Holstein-Friesian Association. Its members shall consist of those participating in its formation and those interested in any way in the advancement of the Holstein-Friesian breed of cattle in the state of California, whether owners or not. Before any one is enrolled as a member he shall sign these Articles of Association, and shall pay to the teasurer the sum of five dollars ($5.00).

Article II.—The official meeting place shall be in the city of Sacramento, and the annual meeting for the election of officers and other business shall be held at 8 o'clock on the evening of the first Thursday after the state fair is opened, and at such place and in such building on the state fair grounds of California as the secretary of said state fair may, from time to time, designate, and said meeting place shall be ascertained by the president in advance, and each member shall be officially notified thereof by letter or postal card mailed to his last known address in ample time to permit his attendance.

Article III.—The board of directors shall consist of 15 members, of which five shall constitute a quorum. They shall be elected annually and serve until their successors shall be chosen and qualified, and at least ten counties shall be represented upon said board of directors in the following manner: Four from below the line of the Tehachapi Mountains; four from the peninsula and various coast counties, and seven from the Sacramento and San Joaquin Valleys.

The said board shall meet immediately after their election and appoint officers. The officers of this association shall consist of a president, two vice presidents and a secretary and treasurer in one person. When vacancies occur either by resignation or death, the same shall be filled for the unexpired term by the president. The board of directors shall appoint the speakers and select the subjects for such meetings as it shall call, and shall make such other arrangements therefor as it shall deem advisable.

All special meetings are subject to the call of the president, and may be held in various cities and towns within the state, wherever deemed expedient by him.

Each director in attendance at a meeting shall be entitled to his actual expenses for railroad fare expended for said meeting.

The secretary's salary may be fixed by the board of directors at such time and in such amounts as it may be deemed advisable.

Article IV.—For the purpose of meeting the necessary expenses of the association each member shall pay to the treasurer once a year the sum of five dollars, but each initiation fee shall cover dues for the first year's membership, or that portion thereof which may antedate the regular annual meeting.

Article V.—Any member of this association who shall be found guilty of any misrepresentation, deception or fraud in relation to the registry of animals in the Holstein-Friesian Herd Book shall forfeit his membership in the association.

Article VI.—These articles may be amended at any regular meeting by a two-thirds vote of those present, provided notice of such proposed amendment is given by the secretary at the request of three members before sending notices of the meeting at which the vote is to be taken.

The board of directors may act on any matter by written resolution, each member signing the same, and such action shall have the same effect as if the committee has met and passed upon it in the regular manner, and the secretary shall enter the same upon the minutes of the association.

In addition to presiding in the order named at meetings of the association or board of directors, in the absence of the president the vice president shall assume the duties of the president, viz: to secure members, to aid and encourage breeders to register their purebred stock promptly in the Herd Book of the Holstein-Friesian Association of America, to report to the secretary any irregularities that may come to their notice where parties sell grade stock claiming them to be pure bred or where sales of registered cattle have been made and transfers promised but never given.

The secretary and treasurer shall keep a true record of the transactions of the association and of the board of directors, and an accurate account of all money received and paid out by him, and shall make report thereof at the annual meeting. He shall be furnished with such books, stationery and postage as may be necessary in the performance of his duties as secretary and treasurer.

Article VII. — This organization, under the provisions of ArticleI, Section 6, of the by-laws of the Holstein-Friesian Association of America, relating to membership, and having 15 or more members, hereby avails itself of the privilege of delegate-membership in that body, and accepts its offered privileges and declares itself duly affiliated as a branch thereof, and subject to the constitution and by-laws of said Holstein-Friesian Association of America. It is the further intent of this club to at all times encourage, promote and assist the Holstein-Friesian Association of America in maintaining its objects and purposes and high character.

The objects of this club may be: The promotion of good fellowship and the general interests of the Holstein-Friesian breed of cattle by securing, as occasion may demand, of favorable legislation; equitable freight rates; uniform classification at fairs; discussion of the best methods of breeding, rearing, and exhibiting and raising the standard of excellence of the breed; to bring before the public the good qualities and exceptional merits of the breed; and other subjects of interest at regularly called meetings, and in all ways to generally promote, widen and extend the interests of this breed of cattle, and to act in unison upon all occasions which demand it.

Article VIII.—It shall be the further duty of the secretary to annually prepare and file with the secretary of the Holstein-Friesian Association of America, upon or before the 30th day of April of each year, and oftener if required, a true and duly attested

statement, under oath, of the proceedings of all its meetings of members and the affairs of the company, including:

1. A complete list of members in good standing, and their residences, together with a list of the officers.

2. The delegate representation to the meetings of the Holstein-Friesian Association of America, to which it is entitled at the rate of three delegates for its first 15 members and one additional delegate for each 50 additional members, or major fraction thereof, in good standing.

3. The name and residence of such delegate or delegates, duly selected at a regular meeting held within 90 days of the date of such meeting of the Holstein-Friesian Association of America.

4. Such statement shall be further countersigned and attested by the president and treasurer. — Signed, Frank M. Helm. Fresno; Gion Gibson, Williams; A. R. Magruder, Ripon; Owen Duffy, Napa; Frank L. Morris, Woodland; J. M. Henderson, Jr., Sacramento; W. H. Taylor, Santa Anita.

ARTICHOKES

The Jerusalem artichoke has a stem something like a sunflower but tubers grow on the roots like the potato. It is more frost resistant than potatoes and has a longer growing season. In fact, the artichoke will live over winter in the ground and come up year after year. It is not difficult to eradicate, however, as spring plowing followed by corn or some other cultivated crop will quickly kill it out. The culture of this crop is similar to that of potatoes, but it may be planted earlier, as the spring frosts do not harm it so much. In late fall the tubers may be dug and pitted or put into the celler in the same waythat potatoes are handled. They wilt more readily than potatoes, however, and will keep firmer if covered lightly with earth to exclude the air.

Their more extensive culture as hog feed is advocated by E. F. Gaines of the Washington experiment station at Pullman.

They may be grown anywhere that potatoes or sunflowers do well. They are more drouth resistant than potatoes and are not considered hard on the soil. In composition the tubers of the artichoke are very similar to the potato tubers and the tops are about equal to meadow hay if cut just before blossoming time.

Probably the most general use of the Jerusalem artichoke is for hog feed, but dairy cattle do well on the tubers, and in the absence of silage it is one of the best succulent feeds for milk production. The artichoke was first cultivated for human food, but the smoother, starchier Irish potato has now largely supplanted it in spite of its smaller yield per acre.

NEW WORLD'S CHAMPION HOLSTEIN

Michigan Holstein breeders are elated at the latest achievement of one of the members of the Black-and-White breed. A world's champion junior four-year-old record has been made by Wandermeere Belle Hengerveld 193784. This great butter cow, who freshened at the age of four years, five months, 12 days, gave 570 pounds of milk, which produced 42.61 pounds of butter, in her seven-day test, and in doing this she became the 18th cow of the Holstein-Friesian breed to make over 40 pounds of butter in one week. Not only that, but she defeated Mabel Segis Korndyke, who has held the junior four-year-old championship of the world for three years, her production figures being 2.29 pounds of butter in excess of the late champion.

Better Than 30 Pounds and a State Record Breaker

Miss Valley Mead De Kol Walker, who last year broke the state record for her age, now comes back at the beginning of her new test as a junior three-year-old with 36.37 pounds butter, making her again winner over all in the state and third highest in the world. Both these records were made on Santa Anita Rancho, under the management of Wm. H. Taylor. Among other big producers on the same ranch are Alba Sadie Cornucopia Creetia, with 34 pounds butter, and Lady Hiske Walker with 31.91 pounds.

REMEDY FOR WORMS IN PIGS

H. O. Harney of Grand View Herd of Durocs, Hampton, Nebraska, writes:

"I will give you a good remedy for worms in pigs or old hogs which is cheap but effective as santonin. Use equal parts by weight sulphate of iron and Glauber's salts mixed and fed in slop, about one tablespoon to every 100 pounds of hog. This will do the work as well as santonin, and there is no danger of injury from an overdose."

Grow as much as possible of your stock food on the farm. Cut down to the lowest limit your bill for mill feeds and concentrates. Make your farm self supporting. Feed your stock with the crops you produce on the farm. Convert your hay, alfalfa, grain, roots, and fodder crops into beef, mutton, pork, dairy and poultry products. Return the manure to the soil, and you will thus conserve the fertility of your land instead of impoverishing it. The keeping and feeding of stock on the farm is the keynote of successful farming.

Where a separator is used the milk can be fed to the calves while yet warm and when a little calf meal is added is equal to the whole milk. Also a separator will get all the cream out of the milk. During summer especially is the separator a labor-saving machine. After the milk is separated it can be fed to the pigs or calves while it is yet sweet and all pails can be washed and set away, so they will not attract the flies.

ECONOMY STOCK POWDER

For

CATTLE—SHEEP
HORSES—HOGS

ECONOMY STOCK POWDER absorbs the gases caused by feeding alfalfa or other heavy foods. In so doing it increases the butterfat and keeps the dairy cow on a better paying basis and more years on the job. Economy Powder will also relieve alfalfa ball of the stomach, constipation and bloat. Has no superior in straightening the cow out after calf birth. Economy Powder will absolutely relieve and prevent calf scours.

ECONOMY STOCK POWDER has stood the test of time. It has been on the market for SEVENTEEN years. Is fed regularly by over 200,000 farmers throughout the United States. Once a customer, always a customer, because the feeder is able to make bigger profits on his stock.

It stands to reason that an animal kept in good condition will produce larger gains. Economy Powder keeps the stomach sweet, the liver and kidneys regulated, the bowels loose and active and the digestive organs in perfect working condition so that the animal will extract all of the nutritious qualities from the grain of which it partakes. At the present high rate of feed this means something, to say nothing of the protection the feeder is afforded against disease.

We publish a valuable booklet, "Economy-Ize Your Farm", full of interesting reading for the farmer and stockman. It is free for the asking. Our faith is also so strong in our products that we will send a free sample of Powder so that you may prove to yourself the merits of our goods. Just cut out the coupon and mail today.

Real Holstein Quality

AT YOUR OWN PRICE

Our offering at the sale at Sacramento, Cal., May 31, 1917, consists of ten highly bred females and two bulls.

One heifer whose first four dams average 34½ lbs. butter in 7 days. Sire, Spring Farm Pontiac Cornucopia, whose dam was the first 44 lb. cow. Her dam, a 31.70-lb. cow in our herd, who was sired by a brother to the twice 44-lb. cow, Ormsby Jane Segis Aaggie.

A daughter of King Korndyke Sadie Vale, whose daughters are making such high records. Her dam, an own granddaughter of Pontiac Korndyke, also De Kol 2nd, Butter Boy 3rd, both great transmitting sires.

A daughter of King Segis Pontiac, he being the best bred son of the great King Segis. Her dam traces direct to Hengerveld De Kol and Pontiac Korndyke.

Seven other heifers equally well bred. Most of these heifers are bred to our herd sire, King Segis Alcartra Abbekerk, whose first eight dams average 30 lbs. butter in 7 days.

The two bulls offered are both fine individuals and highly bred.

One whose first six dams average 28½ lbs. butter in 7 days. Sire, Prince Gelsche Walker.

One a show bull, whose dam has a 28-lb. 3-year-old record with a good prospect for a much larger record. Son of a 36-lb. bull.

All carefully selected from our herd of 125 head.

Soft Butter

Written for California Cultivator By E. H. Hagemann

TO the dairyman who has trouble with soft butter I suggest the following method of making butter: The cream before churning should be ripened to a mild acid taste or flavor. It can be soured or ripened naturally, but preferably by using a starter (clean flavored sour skim milk or whole milk) using one pint to each gallon of cream. When mild acid flavor in cream is reached cool cream to 52 to 56 degrees Fahrenheit and hold for 18 to 24 hours at this temperature before churning. The above temperature should be about right for churning at this time of year, but a temperature should be used low enough so that it will not bring butter in less than 30 to 40 minutes. As temperature is such a great factor in the manufacture and preparation of dairy products, it must be looked after particularly.

It must be remembered that in trouble with soft butter it should be handled in a firm condition all through the process from breaking of the granules to packing and molding of the product. All the moisture possible should be worked out of the butter, but it should not be overworked; only enough so the salt will be thoroughly incorporated and the butter will not appear streaked. Butter cannot be made to stand up well or hold up, especially at this time of year, from cows fresh in milk, and on green feed, even though it is hardened on ice after it is made. Some cows produce softer butterfat than others, somewhat due to larger fat globules in their milk, and it is apparent therefore that it will be more difficult to make butter from an individual cow than from a herd, or a number of herds, the mixing of which insures a more average composition, by which a regular method can be more easily followed.

Aristocrats in Black and White

From the time the herd on the Stanford ranch at Vina was founded by the late Governor Leland Stanford in the early 80's, it has been steadily improved by importations and the infusion of the best blood procurable. Governor Stanford bought his foundation herd from Peter Coutts who had imported extensively for his ranch in Santa Clara County, where the Stanford University was afterwards established. Having entered into the breeding of registered Holsteins, Governor Stanford in 1888 sent Thomas B. Whales to Holland with instructions to secure a number of individuals that would work a decided improvement in the fine stock he had already purchased from Coutts. Whales returned with a big consignment.

On the death of Governor Stanford in 1893, Charles Lathrop took over the management of the Vina property and followed in the footsteps of Stanford in improving the Holstein herd. In 1901 Lathrop sent T. H. Ramsey, now a Red Bluff banker, to eastern states for the purpose of buying the best Holsteins on the market. Ramsey returned with two carloads, and this stock added to the great foundation herd already established, helped immeasurably in the development of the Vina herd.

Under the direction of competent herdsmen, the Stanford Holsteins were developed to a point where the herd was noted for the wonderful capacity of the cows and the great transmitting characteristics of the bulls.

In 1907 Lathrop sent Sam Houseman east for another lot of Holstein pure breds and the result was an addition of two more carloads of the best individuals that could be found in this country.

To the dairyman it will be of particular interest to know that the first A. R. O. work on the Pacific coast was done in the Stanford herd. That was in 1901 when Estepilla made 17.13 pounds of butter in seven days.

During the last year 40 A. R. O. records were made, including two that were for more than 31 pounds. A number of the two-year-olds went over 20 pounds. The showing in A. R. O. work has been such as to indicate that the Stanford herd will produce some of the greatest testing cows in the world.

Announcement that this grand herd will be dispersed June 5, 6 and 7, at the Stanford ranch at Vina, under the direction of M. H. Tichenor, owner of the Palo Alto Stock Farm at Palo Alto, has created more attention than any other announcement of its kind. Already a great number of inquiries have been received regarding the stock to be sold. All applications for permission to buy from the herd before the date of the sale have been declined by Sale Manager Tichenor.

Segis Fayne Johanna
The first cow to produce 50 pounds in seven days.

as it is desired that the buyers at the sale have the opportunity to select from a herd that has never been depleted by sales.

Numerous requests have been made of the sale manager for catalogues, and these will be forwarded as soon as received from the printer.

The indications are that the sale will be the greatest live stock event ever staged in California. Owing to the fact that there will be a large attendance on each of the three days of the sale, Sale Manager Tichenor has arranged for special trains leaving Chico each forenoon about eight o'clock and returning to Chico from Vina each evening after the day's selling. Arrangements are also being made for the housing and feeding of the large crowd that will undoubtedly be present.

THE SLAUGHTER OF CALVES

Written for California Cultivator
By M. C. Holman

THE only excuse for slaughtering calves is found in the surplus of males and lack of feed. It is upon the basis of shortage of feed that the heifer calves are slaughtered, and even then it is questionable whether or not it would not be better to provide the feed, even if the price does seem prohibitive, in view of the fact that milk and beef are commanding particularly good prices.

In one of the towns of the San Joaquin Valley we recently saw 78 veals ready for shipment to market. Each heifer veal represented from eight to a dozen calves and thousands of pounds of milk taken from the productiveness of the state. Each bull calf represented several hundred pounds of good steer meat. The price realized is not at all commensurate with the price that could be realized if the calves were kept for a little time or until they were mature and could be sold as prime beef. The market is particularly high for this class of beef.

The feeding problem is one that deserves great consideration and careful management. A good silo will preserve for future use the surplus feed. With better handling of the crops a large amount can be made available for silage and some that are ordinarily thrown away can be converted into succulent feed.

Owing to unfavorable weather conditions it is estimated that the forage crop this year will be about 80 per cent of normal. It is desirable to have a big crop, and with the present outlook it becomes advisable to make splendid use of whatever available land there is for the production of forage and all other crops. The hill slopes could be utilized; and land along the railways can be had for a small rental, or possibly for nothing at all; the low lands will produce a summer crop; you can plant in the orchard; in short, plant wherever there is available land that can be used without abridging the growth of the present crop.

There is going to be a tremendous slaughter of beef and milk animals this fall and winter, estimated from 300,000 up. There will be 500,000 sheep killed. All on account of the lack of feed. When this great number of meat producing animals is taken from the available supply it means that while beef may be cheap for a time the resultant high prices are sure to make the cost of meat next winter particularly high.

From the point of pure investment and foresight purchase of feed for live

GREAT HOLSTEIN EVENT

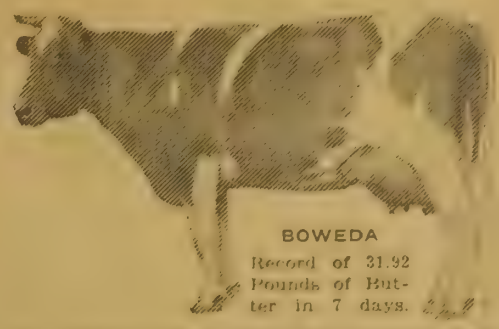
COMPLETE DISPERSAL OF THE STANFORD HERD

AUCTION at Vina, Cal.

(near Chico)

June 5, 6 and 7

9 a. m. Each Day



BOWEDA
Record of 31.92 Pounds of Butter in 7 days.

One of the Many Great Individuals

By order of the Board of Trustees of Leland Stanford Jr. University, the unequaled herd of 300 registered purebred Holstein-Friesians on the Stanford Ranch at Vina, California, will be sold to the highest bidder, June 5, 6 and 7.

AT EACH DROP OF THE HAMMER SOMEBODY'S HERD WILL BE IMPROVED

Intelligent breeding, by the infusion of grandest blood strains, has developd this herd, established by the late Governor Stanford in the early 80's, until it is without a peer.

This sale offers unexcelled opportunities to secure cows of wonderful capacity and bulls of character. All tuberculin tested and free from abortion. Just study these offerings:

40 GRANDDAUGHTERS OF KING OF THE PONTIACS.
The only bull with two 40-pound daughters and the only bull with a 40-pound daughter and a 40-pound granddaughter. He also has a 41-pound 3½-year-old granddaughter.

40 GRANDDAUGHTERS OF COLANTHA JOHANNA LAD
Another wonderful sire with two daughters that made over 750 pounds of milk in 7 days; 30 of them averaged over 600 pounds of milk in 7 days; 8 of them made records of from 30 to 34 pounds of butter in 7 days.

20 GRANDDAUGHTERS OF SEGIS PONTIAC DE KOL BURKE
Leading sire of the Morris herd and one of the best bred bulls in the world. He was senior and grand champion at the California State Fair in 1916.

40 A. R. O. COWS AND MANY OTHERS THAT WILL DO AS WELL OR BETTER ARE TO BE SOLD FROM THIS HERD THAT HAS NOT BEEN DEPLETED BY SALES. THIS STOCK HAS THE GREAT GROWTH POSSIBLE ONLY ON THE PACIFIC COAST AND IS ACCLIMATED. WHY GO EAST FOR UNCERTAINTIES?

Advanced Breeders, Dairymen, Beginners: The blood of these black and white aristocrats is almost invaluable. Can you afford to miss this sale?

300 IN ALL AND INCLUDING MANY SHOW ANIMALS. STANDING OF INDIVIDUALS IN THE HERD ENTERED IN STATE COW COMPETITION WILL NOT BE AFFECTED BY CHANGE OF OWNERSHIP.

THE

Quality Holstein Sale

CONSIGNORS:

Bridgford Company, Knightsen Toyon Farm, Los Altos
J. S. Gibson Company, Williams Frank Hatch, Modesto
Henderson Company, Sacramento
Palo Alto Stock Farm, Palo Alto

These breeders have selected for this sale high class animals to represent their herds, animals that they believe to be fit as individuals and fit as to breeding, to make the best of foundation stock. No better Holsteins have gone into any sale ring than will go under the hammer at this sale.

SOME OF THE FEMALES IN THIS SALE

A DAUGHTER OF KING KORNDYKE SADIE VALE, the only 40-lb. sire that has produced a 40-lb. daughter. He stands today in a class by himself among Holstein sires, and the value of his sons and daughters is rising rapidly.

A DAUGHTER OF SIR SKYLARK ORMSBY HENGERVELD, 24 A.R.O. daughters, among them the great 34-lb. cow Gerben Abbekerk Maid, and the 31-lb. 4-year-old Cristeria Overton Mechthilde 4th.

A DAUGHTER OF KING SEGIS PONTIAC out of a good granddaughter of Hengerveld De Kol.

A DAUGHTER OF SPRING FARM PONTIAC CORNUCOPIA, son of the first 44-lb. cow. The first four dams of this heifer average 34.41 lbs. butter in 7 days. Her dam, at just past 5 years of age, made an official record of 31.70 lbs. butter in 7 days, right after she was shipped to California from the East.

A GREAT COW with semi-official records of over 19,000 lbs. milk and over 800 lbs. butter in one year.

A WELL BRED COW that has a semi-official record of over 15,000 lbs. milk and 644 lbs. butter in 320 days.

A DAUGHTER OF FINDERNE HENGERVELD KORNDYKE, who is by a son of King Segis De Kol Korndyke, sire of the former world's record junior 4-year-old Mabel Segis Korndyke, 40.32 lbs. butter in 7 days.

A SPLENDID YOUNG A.R.O. COW out of a 27-lb. daughter of King Mead of Riverside, sire of Aaggie Acme of Riverside, 35.36 lbs. butter in 7 days—the California record.

A NUMBER OF WELL BRED HEIFERS in calf to It King of the Pontiacs, whose sire is It, and whose dam is by King of the Pontiacs.

AND MANY OTHER GREAT COWS besides a fine selection of unusually good heifers, both open and bred.

THE BULL OFFERING

will be pleasing to anyone looking for a selection among some of the greatest young bulls yet offered for sale in the West. Among them will be

A SON OF A GREAT 33-LB. COW, and she is a daughter of King Hengerveld Aaggie Fayne, who has 7 three year old daughters with official records from 31.94 to 37.33 lbs. butter in 7 days, the 7 averaging 35.25 lbs. butter in 7 days at an average age of 3 years 7 months. The sire of this great youngster is by a son of King Segis De Kol Korndyke, sire of Mabel Segis Korndyke, 40.32 lbs. butter in 7 days at 4 years 2 months. World's record in class when made.

A SON OF FINDERNE PRIDE FAYNE, whose dam is the former worlds' record cow, Finderne Pride Johanna Rue, 36.86 lbs. butter in 7 days; 1470.59 lbs. butter in one year. The dam of this royally bred young fellow is a daughter of Valdessa Scott 2nd, the first 40-lb. cow. She made an official record of 19.16 lbs. butter in 7 days as a yearling. She is a great individual and a candidate for a very large record. She is sired by a son of King Segis De Kol Korndyke out of a 30-lb. daughter of Pietertje Hengerveld's Count De Kol.

A SON OF JUDGE LYONS, son of King Lyons and a daughter of King Walker. The dam is one of the best bred heifers of the Holstein breed. Sired by King of the Black and Whites she is out of LOTTIE WALKER SPOFFORD, the only cow that has made five official records above 30 lbs. butter in 7 days. This splendidly bred young fellow is a great individual, and the transmitting quality of his blood is of the highest rank.

A GRANDSON OF TILLY ALCARTRA, the world's greatest dairy producer, and out of a 28-lb. daughter of Johanna McKinley Segis, whose sire is King Segis and whose dam is the great 40-lb. cow Johanna De Kol Van Beers.

A SON OF PRINCE GELSCHE WALKER out of a 25-lb. 4-year-old daughter of Beryl Wayne Korndyke of Riverside, and she also has semi-official records above 18,000 lbs. milk and above 800 lbs. butter in one year.

A SON OF JUDGE LYONS, whose 7 nearest dams average over 32 lbs. butter in 7 days, out of a 24-lb. junior 3-year-old daughter of King Colantha Clothilde.

A SON OF PRINCE GELSCHE WALKER out of a 21-lb. 4-year-old that made 595.98 lbs. butter in one year as a 2-year-old.

AND OTHERS OF EQUAL BREEDING, out of good record dams and by great sires.

Everything over six months old tuberculin tested.

Catalog in preparation. Write for one.

Auctioneer—Col. Ben A. Rhoades

DO YOU WANT LARGE MILK YIELD Combined with HIGH PER CENT OF FAT ?

If so you will be interested in one of our young registered Holstein-Friesian bulls sired by our herd sire

DUTCHLAND SIR PIETERTJE CREAMELLE

Only ten of his daughters have freshened as junior 2-year-olds or younger. The entire ten average over 20 pounds butter in 7 days. His five best junior 2-year-olds average 22.27 pounds butter in 7 days.

PAULINE INKA DE KOL CREAMELLE
A. R. O. 423.4 lbs. milk, 24.43 lbs. butter in 7 days as a senior yearling. Pacific Coast record in class. Sired by Dutchland Sir Pietertje Creamelle, and out of the 26-pound cow, Pauline Inka De Kol Kate.

so far and all have been tested

One of his daughters, shown in the picture, has just broken the Pacific Coast senior yearling record by producing 423.8 pounds milk and 24.43 pounds butter in 7 days, average test 4.62 per cent, and milking as high as 69 pounds in one day.

Let us tell you more of this sire and his breeding. Only a few of his young sons on hand at present, but they are fine, sturdy young fellows, the kind you would be proud to own. And remember that they are of the breeding that combines LARGE MILK YIELD with HIGH PER CENT OF FAT.

They are priced well within their value. We reply to inquiries promptly.

F. STENZEL, San Lorenzo, California

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

stock, both for meat and dairy, will be particularly satisfying. It is impossible to influence any large number of stock raisers to keep their animals through the period of high prices, and those who have that foresight will be the gainers for they will have milk and beef to sell when the market has been very materially robbed, and the prices obtainable at that time should more than repay one for the extra expense and seemingly prohibitive price of feed.

Another Comeback for Tilly Alcartra

Tilly Alcartra, the wonderful milk and butter factory owned by A. W. Morris & Sons Corporation, Woodland, has just closed her books on her fifth consecutive year of dairy manufacture, and a brief summary of her business operations is interesting at this time.

The totals of her five year production may be reduced to a few lines of type thus:

Age at freshening.	Milk 1 year Pounds.	Butter 1 year Pounds.
2 yrs. 6 mo. 17 days	14837.2	556.20
3 yrs. 5 mo. 26 days	21421.3	841.22
5 yrs. 1 mo. 6 days	30451.4	1189.03
6 yrs. 5 mo. 20 days	29826.6	1190.46
7 yrs. 7 mo. 9 days	26815.4	1042.21
Total 5 yrs	123351.9	4819.12
Average per yr	24830.38	963.82

But the few lines of type showing her total production do not begin to tell her story. Picture to yourself that her milk yield in five consecutive periods, beginning with her first calf, makes a total weight of more than 60 tons, or more than 12 tons per year; that in the same period she produced nearly two and one-half tons of butter, almost half a ton a year on the average, and for three consecutive years she has produced over a half ton of butter each year; that she has dropped five living calves upon which it is impossible to place a valuation; that she has won several hundred dollars in prize money on her production records; that she has done more to effectively advertise California as a dairy state than any other cow yet developed; that her record of continuous production stands unequalled in all the world among all dairy breeds; and complete the mind's picture by looking at Tilly herself as she stands today, a fat, silken coated, vigorous cow, in the prime of physical health, keen of appetite, bright of eye, and to all appearances thriving upon and enjoying the production pace which she is setting.

Better Than 30 Pounds

Tilly Alcartra. Seven-day production 32.23; 30-day 126.71. This wonderful cow is the first to pass 30,000 pounds in 365 days, and this all in California with California feeds. Property of Morris & Sons.

Field Notes From the Live Stock Men

W. Bernstein reports recent sales of Poland-Chinas to Miller & Lux two boars; to M. and A. Bemmerly, one boar; to Hamilton & Colcote, one boar and three sows; to Hal. B. Parker, one sow.

Hillcrest Farms Company has been located in Fresno County near Caruthers and will be the home of a new Holstein herd recently brought from the East by H. E. Spires and J. M. Crawford. Besides Holsteins these men will breed Duroc hogs and White Leghorn chickens. Their herd sire is a three-year-old son of King Segis Pontiac Count and judging from his breeding he should make a very valuable addition to the Holstein blood of California.

Some Great Heifer Records—Some of the very best two-year-old heifer records yet made in the West have been made in the herd of registered Holstein-Friesians owned by F. Stenzel, San Lorenzo, within the past year. A particular feature of these record makers are the daughters of Dutchland Sir Pietertje Creamelle, the senior sire in the herd. Only ten of his daughters have freshened to date and all have been put on official test. The ten, all of them yearlings and junior two-year-olds, have averaged over 20 pounds butter in seven days. Five of them average 22.27 pounds butter in seven days. One of them was for a time the California state record junior two-year-old, and the latest one to freshen, Pauline Inka De Kol Creamelle, freshening as a senior yearling has made an official record of 423.8 pounds milk and 24.43 pounds butter. Her average test was 4.62 per cent and her best day's milk 69 pounds. The daughters of Dutchland Sir Pietertje Creamelle come by their production honestly through their breeding. He is sired by a son of the famous cow, Changeling, who is also dam of Changeling Butter Boy, sire of Changeling Tidy Abbekerk Wayne, the great cow that recently made 40.62 pounds butter in seven days in Dr. Work's herd in Colorado. Changling Butter Boy is also sire of the great young cow that recently made 34.74 pounds butter in seven

days and over 141 pounds in 30 days in the Morris herd in Woodland, she being 100 per cent the same blood as Changeling Tidy Abbekerk Wayne. Dutchland Sir Pietertje Creamelle is also out of a daughter of Creamelle Vale, the former worlds' record cow that produced 29750.2 pounds milk and 1155.85 pounds butter in one year, and is the dam of Dutchland Colantha Vale that produced 22750.2 pounds milk and 857.43 pounds butter in one year as a junior two-year-old. His dam is also sired by Pontiac Butter Boy who is the sire of Changeling Butter Boy, thus giving Dutchland Sir Pietertje Creamelle a large percentage of the blood that has produced a 40-pound cow and a 34-pound cow to add to the long list of high record daughters of Changeling Butter Boy. Mr. Stenzel has as a junior herd sire a son of King Korndyke Sadie Vale, the only 40-pound bull in the world that has produced a 40-pound daughter, and the blending of his blood with that of Dutchland Sir Pietertje Creamelle promises much for future production in this herd.

O. J. Ames of Stanislaus County writes that he has made sales of young bulls to Louis Skadsheim and J. M. Aitchison of Winton, E. O. Blickschmidt, Patterson, R. J. Smith, Oakdale, and Mrs. S. W. Taylor, Loomis.

Elmer Lamb of Ceres reports the following sales: Boar to Fraser Bros., Arizona; three bred gilts and one boar to C. B. Crawford, Wasco; two bred gilts to M. C. DeFraga, Bolinas; bred gilt to Ben Armstrong, Quincy; three bred gilts to Albert Dickey, Dixon; bred sow to Miss Millicent Bucholz, Merced; boar to W. S. Rishey, Merced; boar to W. S. Vacaville; gilt to J. M. Duncan, Visalia; gilt to W. H. Dixson, Heughson.

ANNUAL MEETING OF AMERICAN JERSEY CATTLE CLUB

The forty-ninth annual meeting of the American Jersey Cattle Club in New York, held at the Waldorf-Astoria on Wednesday, May 3d, at which every state but one was represented, disclosed that the year just ended has been the most successful in the history of the club.

The secretary's report showed the finances of the club to be in excellent condition and also showed a substantial increase in the amount of business transacted. During the year 36,117 Jerseys were entered in the Herd Register, and there were 34,499 transfers recorded, indicating an increase of 17 per cent over the year before in the sale of Jerseys, which is the largest increase in transfers that has been recorded for over 12 years. Eighty-four new members were admitted to the club during the year, bringing the total membership up to 649 against 592 the year previous. There are now 100 applications for membership pending, and it is expected that the club membership will soon be over 700.

M. D. Munn of St. Paul, Minnesota, was unanimously re-elected president of the American Jersey Cattle Club, Ed. Cary of Carlton, Oregon; F. J. Bannister of Kansas City, Missouri; W. Gettys of Athens, Tennessee, and George Batten of New Jersey, were elected members of the board of directors for a term of three years. At a meeting of the board of directors following the annual meeting, F. W. Sessions of Utica, New York, was elected vice-president. R. M. Gow was reappointed secretary.

Madison had a rice carnival on the 13th.

"IT"

"Short in Name and Long in Quality" is a phrase applied to the bull of one of the best producing strains purchased something over a year ago by McAlister & Sons. This bull, purchased in the greatest of Holstein states of the Union is now at the McAlister Ranch at Chino, and the McAlisters say will have, within a few months, 100 living daughters, practically all out of daughters of the King of the Pontiacs. One-fourth of these have over 30-pound records.

The McAlisters say: "We intend to give 'It' the best opportunity of any bull in the West, as he will be bred to more 30-lb. cows, 25-lb. cows, A.R.O. cows and 20-lb. two-year-olds than any other bull on the Pacific Coast."

Mr. McAlister says that he had had his eye on this great animal for some time, especially because of the great records made by his offspring. "When we first saw him we found it impossible to buy "It." At that time we bought a number of heifers in calf to him. Before we bought "It" a careful examination was made again of all his daughters, and especially those with first calf, but they all passed the test with honor. We believe no bull in the United States has ever sired a more uniform lot of daughters with as much show type and individuality.

Referring to his breeding, the Holstein-Friesian World says: "He possesses a combination of blood lines that cannot be surpassed."

The Steven Brothers, his former owners, in speaking of this sale in the Holstein World, say: "In the face of the fact that McAlister & Sons placed before us a large cash offer, we decided to part with "It" and, as we have said, he is now at their ranch in California. We believe they have secured a sire of great worth as he has produced in our herd some wonderful progeny! We certainly believe that we could say no more in favor of 'It' than that we have used him exclusively on daughters of King of the Pontiacs and we know of no greater recommendation for the sire's ability, and we also believe that breeders in general will realize how strong was our confidence in him. The daughters of 'It' have started off mighty well on official test. He already has a two-year-old with 23.92 pounds to her credit, another that has better than 21 pounds as well as several between 19 and 20 pounds as two-year-olds. Those who see these daughters for themselves will join in congratulating McAlister & Sons on securing this young sire."

Better Than 30 Pounds

Woodcroft Ybma Pietje. Milk seven days 585.1 lbs., butter 31.38; milk 30 days 2594.4 lbs., butter 124.00. Owned by McAlister & Sons.

Elliott-Brant Rancho Guernseys Are Persistent Producers

The results of our first two years of official testing show our herd to average 10,172.28 Pounds of Milk and 507.97 Pounds of Fat. One half of these cows were heifers with first calf who averaged 8,670.24 Pounds of Milk and 436.01 Pounds of Fat (only 7 pounds under the average of all A.R. records). Our mature cows averaged 12,710.5 Pounds of Milk and 621.52 Pounds of Fat (120 pounds over the average of the mature cows of the breed).

A bull from these cows will increase the production of almost any herd.

THE FERMENTATION OF SILAGE

By A. R. Lamb, Iowa Agricultural College

CERTAIN other well-known fermentative processes are somewhat similar to silage fermentation. When hay is stored too green it is likely to heat, even to the combustion point. This heat is only the outward evidence of other changes which are taking place in the hay. Grain stored in bins undergoes certain chemical changes, which sometimes develop a noticeable amount of heat. These and similar changes, which are undergone by all living plant material when stored in large masses, are in some respects like silage fermentation. The fermentation of sauerkraut is also similar in that the preservation of the kraut depends upon the formation of organic acids by bacterial action. The formation of vinegar from cider involves the production of acetic acid, which is one of the acids found in silage. This change takes place necessarily in the presence of air. On the contrary, the changes which are normal to the formation of good silage take place almost entirely in the absence of air.

Since corn (maize) is the principal silage crop in this country, all references to silage will be understood as being to corn silage unless otherwise stated.

In silage making the chopped corn forage is tightly packed into an air-tight silo, with plenty of moisture present, and fermentation begins at once. The first evidences of change are a slight rise in temperature and the evolution of carbonic acid gas. This gas is generally known to be poisonous, but accidents still occur occasionally when the gas, which is heavier than air, collects in a partially filled silo. If a lighted lantern lowered into the silo is extinguished, it is almost certain death to enter before the gas has been driven out by starting the silo-filler or by opening a door near the surface of the silage. The temperature of the silage rarely exceeds 85 degrees to 90 degrees Fahrenheit, except near the surface, where fermentative processes are greater, owing to the presence of air. Erroneous ideas regarding the importance of the heating in silage fermentation were derived from observations made only on the surface of the silage. The oxygen in the silage is used up early in the process of fermentation or driven out by the carbonic acid gas. From this point the presence of air or oxygen is fatal to the proper preservation of the silage, because air permits the development of molds, which are themselves sometimes poisonous, and which quickly destroy the acids and thus allow the silage to spoil. The importance of air-tight walls and proper packing down of the silage to keep out the air is, therefore, at once apparent.

The Formation of Acids

The next changes noticed during the silage-making process are a change in color and the development of a more or less pleasant aromatic odor and a sour taste. The color and odor are characteristic of silage and are of considerable value in judging its quality; but the most important change is the formation of acids which cause the sour taste. The acids formed are chiefly lactic acid, which is the acid found in sour milk, and aectic acid, the acid of vinegar. The total amount of acid formed averages between one per cent and two per cent of the weight of the silage.

HOLSTEIN CATTLE

The broad highway to success is persistent and intelligent application to something worth while. A successful 60-year-old dairyman said, "I have made the greater part of my money since I was forty-five. Up to that time I was making mistakes. I corrected a host of mistakes and ideas about cows and have made nearly all the money I have since that time." The difficulty is that some dairymen never wake up. Any farmer who will devote a short time to a study of the supremacy of Holstein-Friesian cattle as profitable milk producers and as dual purpose cattle will be able to turn his dairy operations to a profitable basis. Send for free literature. There's big money in the big "Black and White" Holsteins.

DUROC JERSEYS

Sows, gilts and a few boars of the best breeding FOR SALE

H. P. Slocum & Son R 1 Willows, Cal.

This change is important because it indicates that the fermentation is healthful, like the ripening of cream or the formation of vinegar, instead of being a state of unhealthful decay, like the putrefaction or spoiling of meat. In the presence of this acid fermentation it is impossible for the bacteria which cause decay to live and work, unless the presence of air should allow the growth of molds, which in turn destroy the acids, and thus allow the putrefactive bacteria to thrive. This last process is what occurs in the top layer of the silage in the silo, which is spoiled because of the presence of air. The formation of acid is, therefore, one of the most important of the changes which take place in the fermentation of silage.

The Formation of Alcohols

Other changes occur in the process which are not appreciable to the senses, and which can generally be detected only by chemical analysis. One of these is the formation of a small amount of alcohols, chiefly ordinary or grain alcohol. The total amount of alcohols generally varies between 0.1 per cent and 0.4 per cent of the weight of the silage, or as much as 0.5 per cent of the juice. The source of the alcohols, as well as of the acids, is the sugar originally present in the plant. Experiments conducted by the writer show that the amount of sugar which disappears is almost exactly equivalent to the amount of alcohol and acid formed. About one-half of the sugar present is ordinary cane sugar. This is first broken up into simpler sugars, such as glucose, and then the simple sugars are changed into alcohol and acid.

Other recent experiments show that the amount of simple sugars in the silage is at first increased by the breaking up of some of the starch; but the total amount of sugar present, after fermentation is over, is much less than in the green plant material. Sometimes practically all the sugar is used up. The amount of sugar in the green plant, and, therefore, the amount of acid in the silage, depend upon the maturity of the plant when harvested. The amount of sugar in the plant decreases as the plant approaches maturity.

Another characteristic change is the breaking down or digestion of protein matter, or the flesh-building constituent of foods. This merely anticipates some of the digestive processes in the alimentary tract of the animal which eats the silage, and therefore does no harm, since little or no nutritive value is lost.

HOLSTEIN-FRIESIAN ANNUAL

The 32nd annual meeting of the Holstein-Friesian Association of America will be held in Worcester, Massachusetts, Wednesday, June 6. Besides report of the auditor, treasurer and other departments it is proposed to amend the by-laws, elect officers and transact other business, which will mean much to the Holstein-Friesian interests. Secretary F. L. Houghton of Brattleboro is planning that this shall be a great meeting.

CALIFORNIA PET STOCK ASSOCIATION

The California Pet Stock Association has been organized and is making an effort to secure membership in all counties of the northern end of the state. Its slogan is: "Together for a bigger and better pet stock fancy for Northern California." The dues are one dollar per year. The officers for the first term are: President, A. E. Bettes, San Francisco; first vice president, J. J. Berry Auburn; second vice president, W. C. Parsons, San Mateo; secretary treasurer, Hale Prather, Ukiah.

TWO FLEECES

The American Sheep Breeder is calling on every sheep owner in the United States to offer for army use two fleeces of wool. The appeal reads in part:

"Listen, Shepherds! Are you willing to offer Mother Columbia 'Two Fleeces of Wool' to clothe her 'Boys' who march to the front? The boy who wears your wool will be your soldier boy, fighting for you and yours. Your soldier boy will be numbered in the 'Legion of the Golden Fleece'. He will be clothed from head to foot in pure wool, the gift of the shepherds of Americaa. Let this be a free gift to Mother Columbia.

"Select two choice fleeces—the first fruits of your sheep harvest—and ship in a nice clean sack by parcels post to American Sheep Breeder, Record Building, Union Stock Yards, Chicago. The donor's name should be plainly written on a strong tag tied firmly to the outside of the sack. These fleeces will be turned over to the government authorities, who will arrange for its manufacture into clothing for the Legion of the Golden Fleece.

PATRIOTISM DEMANDS

That All Butter-Fat Waste Be Stopped

President Wilson's powerful appeal for the conservation of the nation's resources is still ringing in our ears. "The supreme need," he says, "of our own nation, and of the nations with which we are cooperating, is an abundance of supplies, and especially of food stuffs;" and again, "Upon the farmers of this country, therefore, in large measure rests the fate of the war and the fate of the nation."

Wasteful methods must be abolished. Every device that makes for the saving of time and labor on the farm must be utilized. Every plan that makes for the conservation of our food products must have the farmer's hearty cooperation.

And nowhere is there greater opportunity than in the production of dairy products, particularly butter-fat.

"Fats, fats, fats, more fats," that is the demand of the warring nations in Europe. The men who toil and the men in the trenches must have fats. They are the fuel that the human machine must have.

And no fat is so palatable or so easily assimilated as butter.

When it was simply a question of the farmer's own loss of profit, the tremendous waste of butter-fat on American farms was bad enough, but under present conditions such waste is nothing short of criminal.

And it is wholly unnecessary.

It is conservatively estimated that about a million cow owners in the United States are still skimming milk by some wasteful "gravity" method.

At an average of four cows to the farm, and an average waste of thirty-five to fifty pounds of butter-fat per cow, all of which could be saved by the use of a De Laval Cream Separator, this alone represents an annual waste of at least 140,000,000 pounds of butter-fat.

Then there are, perhaps, a million inferior or half-worn-out separators in use whose owners could save fifteen to twenty pounds of butter-fat per cow per year by replacing such machines with New De Lavals; and this represents another waste of at least 60,000,000 pounds of butter-fat annually.

Also there is the loss of time and labor that a De Laval would save and which could be better devoted to other productive work on the farm. This waste is hard to compute, but it is almost as important as the loss of butter-fat.

These are startling statements, but any dairy or creamery authority will agree that these estimates of waste are really very conservative.

Shall this tremendous waste continue? Will the loyal American farmer permit such waste when he appreciates the duty that is laid upon him to conserve the only article of food that above all others is necessary to the life and health and energy of the men who serve the nation in the field, the factory, the mine—and soon in the trenches?

We have always had an abiding faith in the American farmer, and we believe that if he is made to appreciate the full purport of the President's appeal to him, the appeal will not be in vain; and when he further appreciates what the De Laval can do to save the butter-fat which is now being wasted, and that his patriotic duty demands that such waste be stopped—NOW—our plants will not be big enough to take care of one-half the demand for De Laval Cream Separators.

MACHINERY

FOR SALE—WHY BUY NEW?
SAVE HALF

Material guaranteed. It's 2nd hand after used few times, but not necessarily worn out.

NOTICE TO OUR CUSTOMERS

Our prices on used windmills, used redwood tanks, and ranch tools are same as they were years ago. Advance on great many articles is a fad which we refuse to follow.

Price on new galvanized iron tanks and pipe we have been compelled to raise on account of new material costing us more.

WINDMILLS

Let the wind do it. 8-ft., $21.50; 10-ft., $28 to $32.50; 12-ft., $45 to $55. Have three 16-ft. mills; cost new $285; our price $125, and $95. Pumps as much as 4-h.p. engines for nothing once installed. Beats gas at 19c.

TANKS—TANKS
USED AND NEW GALVANIZED AND REDWOODS.

1000-gal., $32.50; 2000, $44. Have used galv. 500, 1000, 1500, 10,000-gal. storage, $125; 14,000, $200. 20,000 heavy corrugated, nearly new; cost $600, for $235. Redwoods all sizes.

ENGINES. PUMPS. PIPE.

Most all sizes—in good shape.

Centrifugal pumps, 2-in. $24; 3-in., $35; 4-in., $45; 5-in., double runner, $95; all size plunger pumps, $5 up; new pump jacks, $12.50; double-acting No. 3 Ames, $200, cost $660; Means double-acting deep well pump, $275; pumps 50 inches; 12-h. Lambert engine; 9-h. Foos, $135; 6-h. Stearns, $89. Many other first class engines very cheap.

Brass Cylinders, All Sizes.
Plunger rods, pipe, pipe fittings.
Ranch Machinery. Sundries.

Walking, riding plows, $15 to $22.50; fine 2-gang mouldboard plow, $45; 2 or 4-gang disc tractor plow; alfalfa renovator, $25; 24-disc, 4-horse harrow, $38; fine Bull tractor, $295; cement mixer, $35; sprayer, $19.50; mowers; buck rake, $25; power hay baler; bone grinders, $5 to $12; corn sheller, feed grinders.

Wanted to buy first class material. No junk wanted. Pioneers in our line. DEMMITT CO., Upstairs, 120 N. Main. Yard, 816 Yale, Los Angeles.

For Sale—Good as new, one 2-stage centrifugal pump 1¼-inch, cost $100. Will take $40. United Iron Works make; One 1-inch American make centrifugal pump, cost $30, will take $15; one American Bean thresher, cost $450, used 20 days. Will take $250. Chas. Maha, Arroyo Grande, Cal.

Several new and slightly used engines at a bargain. Best makes. 1 to 35 h.p. Arnott & Company, Wholesale Machinery and Implements, 112 South Los Angeles St., Los Angeles, Cal.

For Sale—New and second hand distillate engines, pumping machinery of all kinds. Be sure and get our prices, it will pay you. Wm. Gregory & Sons, 602 N. Main St., Los Angeles.

VISALIA GETS A GOOD ONE

Continued from Page 575

Steele's Grants Pass, Oregon, herd, and brings with her the prestige of the best of breeding as well as show ring records. She is called Duke's Lady Value 10th, was first under year sow in 1913 at the Indiana, Tennessee and Kentucky fairs winning same award that year at Memphis and at the American Berkshire Congress. She was grand champion at Indiana, Tennessee and Memphis Fairs and junior and reserve grand champion at the American Berkshire Congress in the same year. As to breeding it could hardly be better. She is sired by Baron Duke 170th, who was grand champion boar of America in 1911. She is out of produce of dam champion of America 1913. She is bred to Laurel Champion, the twice grand champion of the Northwest Circuit, who has sired more prize winners than any other boar in the United States. She and her progeny should do much for the breed in California.

PREPAREDNESS, TRAIN

Three states and the Salt Lake railway are uniting in a great "Preparedness' agricultural demonstration train. This train started on May 1 from Sandy, Utah. It passed through that state and a part of Nevada and on Thursday of this week reached Victorville, this state. Friday and Saturday it is at Ontario and San Bernardino. Monday, the 21st, it spends a day at Riverside, 22nd Pomona, 23rd Whittier, 24th Pasadena, 25th Long Beach, 26th Glendale, and 28th Los Angeles.

This is said to be the most elaborate educational special ever operated by American institutions combined with railways. There are 12 cars of exhibits in the train. The agricultural colleges of California, Utah and Nevada unite in supplying the educational force of 20 instructors.

The 12 cars are filled with exhibits of nearly all kinds of farm implements and farm machinery. Tractors are exhibited from three of the largest tractor manufacturers. One entire car is given over to electric devices, including generators, dynamos, motors, etc., and one car is devoted to bean culture and to demonstrating forage crops. In addition there is one car devoted to a demonstration of Red Cross work, and another is used by the Utah and Idaho Sugar Company, combined with the Southern California companies, in displaying exhibits illustrative of every phase of sugar beet culture. We believe the exhibition cars will be placed in the yards of the Salt Lake railway in each town.

ORCHARD PLANTING IN MERCED COUNTY

Horticultural Commissioner Beers of Merced County sends in the following plantings:

Number of trees and vines planted in Merced County season 1917: Grape vines, 1,131,383; almonds, 42,145; cling peaches, 24,481; figs, 7584; freestone peaches, 5047; apricots, 4971; prunes, 2502; olives, 2080; walnuts, 1444; other fruit trees, 1649.

PROFITABLE SILOS

Note the "Prosperity Sign" on front cover this week. "Silos everywhere" should be the slogan of California live stock men. These silos are the "Perego" made by the Redwood Manufacturers Company, 1904 Hobart Building, San Francisco. Write that concern for other photos and information.

These silos are on the ranch of the Stanford University at Mayfield and have proved entirely satisfactory. Read page 554.

NOTHING BUT GOOD RESULTS.
Have used GOMBAULT'S CAUSTIC BALSAM for more than 20 years. It is the best blister I have ever tried. I have used it in hundreds of cases with best results. It is perfectly safe for the most inexperienced person to use. This is the largest breeding establishment of trotting horses in the world, and use your blister often.—W. H. RAYMOND, Prop. Belmont Park Stock Farm, Belmont Park, Mont.

USED 10 YEARS SUCCESSFULLY.
I have used GOMBAULT'S CAUSTIC BALSAM for ten years; have been very successful in curing curb, ringbone, capped hock and knee, bad ankles, rheumatism, and almost every cause of lameness in horses Have a stable of forty head, mostly track and speedway horses, and certainly can recommend it.—C. C. CRAMER, Training Stables, 990 Jennings Street, New York City.

Sole Agents for the United States and Canada.

Santa Anita Rancho
Anoakia Breeding Farm

ARABIAN-THOROUGHBREDS: Two-year-olds, sired by imported Stallion Ibn Mahrusa, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahrusa, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three-year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars, Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Geischo Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

Flush Out the Cow After Calving

Thorough irrigation of the uterus and vaginal tract with a reliable antiseptic, once or twice after a cow drops her calf, will give you the greatest insurance you can have against Barrenness, Abortion, Retained After-Birth, etc.

B-K is more effective than lysol, carbolic acid, Lugol's solution and oily coal-tar disinfectants, which all make the uterus more acid, and do not clean. B-K heals the uterus and vagina by cleaning and removing the slime and acid. It kills the germs because it is much more powerful. The application of B-K as a douche is simplicity itself.

If your dealer does not have B-K—send us his name. Dealers wanted in every town.

Awarded Gold Medal Pan.-Pac. Exposition.

FREE BULLETINS—Send for complete information—"trial offer" and bulletins on Farm Disinfecting—Contagious Abortion—Calf Scours—Hog Sanitation or Poultry Raising.

The Demand for Horses

Wayne Dinsmore, secretary of the Percheron Society of America writes:

"The United States, now actually at war, confronts the tremendous task of increasing its production of foodstuffs sufficiently to provide amply for its own people and to supply all the foodstuffs needed by the allied nations.

"Maximum crop production requires plenty of horses, men, and efficient farm machinery. Powerful draft horses do more to compensate for labor shortage than any other factor. Gang plows of two 14-inch bottoms, with five powerful draft horses, will turn from five to five and a half acres per day; will, on a 20-wheel disk harrow cutting nine feet in width in the field, disk from 14 to 18 acres per day; and on a 20-hole disk seed drill will seed from 18 to 20 acres per day and cover it in the same operation. Only heavy draft teams can make such efficiency possible. Horses weighing over 1600 pounds each in working condition are needed, and five of them to each farm teamster employed. Where such heavy draft horses are not available, smaller implements are used, and the daily turnover in work accomplished falls to approximate half that which is being done by men with heavy teams and plenty of them.

"The United States does not need an increase in mere numbers of horses and mules. It does need an increase in well proportioned, powerful draft horses. There is no danger of overproduction of good thick farm chunks weighing from 1300 to 1600 pounds. This latter can be, and are being, produced by breeding common light mares of mixed blood weighing from 900 to 1400 pounds each, to sound well proportioned Percheron stallions. Every mare of this kind should be bred to the best draft stallion available, and every draft mare should be bred to the best stallion within reach.

"The breeders of small numbers of Percheron horses, who make up 90 per cent of American breeders, are unanimously of the opinion that they have never had so prompt sales for good stallions rising two or rising three nor received so satisfactory prices as during the past eight months. Importations are practically nil, and the steady increase in demand for good draft horses gives promise of a most excellent future for the shrewd farmer who realizes the advantage of using Percheron mares in his farm work.

"Exports of horses to Europe for war purposes from September 1, 1914, to March 1, 1917, totaled 853,116 head, valued at $182,994,406 and 289,062 mules, valued at $58,051,914. British army officers have given unstinting commendation to the grade Percherons which have been sent from this country to Europe for artillery purposes. The effectiveness of the Percheron has been so great that studs of pure bred Percherons have been established in Great Britain in consequence."

Silage Increased Profit on Cattle

Scott Cunningham of Palmyra, Missouri, has found a more profitable cattle feeding plan after three years of careful study and accounting. His first two trials with cattle were less profitable than he had expected, although they were conducted in the usual manner. His first car of cattle, averaging 598 pounds a head, was bought in March, 1913, at $7.15 per hundred. From March 29 to May 23 they consumed 35 tons of silage and five tons of wheat straw. Then they were pastured until September 20. The pasture was valued at 90 cents per head per month. From September 20 to November 1 they received gain on pasture. These cattle consumed 890 bushels of corn, 8 tons of clover hay and 1½ tons of cottonseed meal up to January 12 when they weighed 1051 pounds and were sold for $8.10 a hundred, or a total of $2085. The cost of the cattle, including feed, was $2055.92 or only $29.08 below the selling price. This plus $185 worth of pork produced behind the cattle constituted the $214 profit on the 25 head.

A similar lot of cattle was purchased in the winter of 1915 and handled in much the same manner with the exception that the cattle were fed 200 shocks of corn and five tons of mixed hay, instead of silage and straw, before they were turned to grass. From May 1 to October 1 they were pastured. During the four months following October 1 the cattle were fed 800 bushels of corn, ten tons of mixed hay and three tons of cottonseed meal. On February 5, 1916, they averaged 1149 pounds a head and were valued at eight dollars a hundred. The sale price was $221.16 less than the cost of the cattle and the value of the feed they consumed. However, $307.50 worth of pork was made behind these cattle, and consequently they returned a profit of $86.54.

Grazing operations as a whole proved profitable. Realizing that he must continue in the cattle business to find a market for his roughage and grass, he began to seek a means of finishing his cattle at less cost. The next lot of cattle was bought in February, 1916, at $7.25 a hundred and averaged 638 pounds at home. From February 6 to May 1 they were fed 25 tons of silage, four tons of clover hay and one ton of cottonseed meal, after which they were grazed until October 1. The feed from October 1 to December 19 included no corn except that in the silage. During this period the cattle consumed seven tons clover hay, 3½ tons cottonseed meal and 36 tons silage. They were valued at $8.50 a hundred December 19 when they were sold for $2108.95. This minus $1587.15, the original cost including feed, left a profit of $521.80. No hogs followed the cattle. The feeding plan in 1916 not only proved more profitable on high priced feed than in 1915 but made a larger gain on less feed.

According to S. T. Simpson of the Missouri College of Agriculture, Mr. Cunningham's 1916 feeding plan is similar to that of many other feeders. The use of silage and the reduction of the corn ration is the latest departure in beef making. While Mr. Cunningham's experience in itself is not conclusive, yet feeders and experiment stations are finding similar plans equally profitable and it is safe to assume that the principle is sound.

Holstein Bulls

Well bred, vigorous, registered Holstein bulls of good type for sale. Steady sales have moved all our bulls of service age, but we have a few unusually good calves to offer at moderate prices

A Minimum Ration

Written for California Cultivator By Jean A. Koethen

A FRIEND who has been quite successful with her back-yard flock writes: "So far with my two dozen Rhode Island Reds I have come out ahead every month, but at the present prices I am fearful that it is asking too much for the good hens to pay their board."

The problem is a serious one, and some flocks are going to the butcher because of it, while many poultrymen, unwilling to see their hens and their living go, are making a gallant fight to find some way of cutting down with advantage, not for Leghorns, perhaps, but for hens of the heavy breeds, which so readily put on fat. Some breeders maintain that if you can only keep a hen laying she will not lay on fat; others see the reverse of the shield and say, "Feed her so she will not put on fat and she will lay."

Lee R. Wellington of Inglewood is one of the latter. He has studied the feeding of White Rocks and Light Brahmas for a number of years and is convinced that these breeds, at least, can be fed much more cheaply than they generally are. He has worked out a ration which keeps his hens in the pink of condition at the minimum expense, and has used it for three years, long enough to test its merits. During that time some of his Light Brahmas have made remarkable records, not only in their pullet year, but in the second and third, an age when most heavy hens have put on so much fat that they are of little use.

Mr. Wellington prepares the following mixture, to be used as needed: Three pounds each of fish meal, beef scrap, bone meal, oil cake meal, chilt pepper (chopped fine), and blood meal; two pounds charcoal, two pounds sulphur, one pound Epsom salts, half pound table salt. For the morning mash one pint of this mixture is added to one gallon of bran, and to this is added ten gallons of cut clover. When all is thoroughly mixed, sufficient water is added to make the bran stick to the clover. The hens are given all they will eat of this in half an hour or thereabouts. If any remains in the trough it is removed. No more food of any kind is given until late in the afternoon, when rolled barley and whole oats are thrown in deep litter. By this time the whole flock is hungry enough to scratch for its supper, and each hen gets a good square meal with exercise to digest it. Mr. Wellington finds that his Rocks need more of the mash than his Light Brahmas. When the mixture is fed to Mediterraneans the proportion of mash to clover is doubled. The above formula, one gallon of the bran mixture and ten gallons of clover, makes a breakfast for 75 heavy hens.

Even on this ration a hen sometimes begins to put on fat. The flock is inspected every week or two, and when a hen is found with a fat, flabby abdomen instead of a hard, muscular one, she is given a capsule of Epsom salts and another of sulphur. These capsules cleanse the system and help it to dispose of the extra fat, and the hen is soon back on the job.

The same egg mixture, slightly modified, is used for baby chicks. The chicks are started on rolled oats and chick feed. After two or three days the following mixture is placed before them in hoppers: One gallon bran, one gallon shorts, one pint of the egg formula used in the laying mash. At the end of three weeks this is replaced by the regular laying mash. The chick feed is exchanged about this time for growing chick feed, and later another change is made to the rolled barley and whole oats which is given layers. These changes in the grain mixture are gradual, as all such changes must be. No definite time can be set for changing from a finer to a coarser grain, for all depends on the way the chicks have been fed. Chickens will turn away from Egyptian corn at two months of age if it has not been given them before, while three weeks' old birds that have had it before them from the start will eat it eagerly.

When Mr. Wellington's chicks are about two months old, a mixture of bran and alfalfa molasses is put before them in the hoppers, and is kept before them, while the laying mash is given only in the morning when it is given to the hens. This simplifies the feeding program, while the bran and alfalfa is an excellent food for developing size and hastening growth. On such a ration as this Brahmas can be raised to laying age as cheaply as Leghorns, and when carefully fed they lay nearly as many eggs—quite as many, their admirers say, but this is probably a matter of strain rather than breed. Without doubt the Light Brahma, properly fed, is one of the best of dual purpose fowls and a bird to please the fancier's eye as well. But the Brahma, like the Rock and the Orpington, is not a bird that can be left to select its own ration or be brought up on a haphazard diet.

Stale Bread for Poultry

We have a communication from Mrs. L. M. Larson, Santa Barbara County, in which she advises looking to the wastes and saving all that is possible, especially feed concentrates which at this time are exceptionally high. As she says, with eggs selling wholesale at 20 and 25 cents the small poultryman will be glad to find a substitute for high priced grains. She says that stale bread may be purchased from bakers at from one and a half to two and a half cents per pound. If so, this is an economic question which calls for correction, that is, if such waste is made by bakeshops to any general extent. With flour over five cents per pound it is a criminal waste which in present times should not be permitted, but admitting that great quantities of this stale bread might be purchased, is it as economical as it first appears? Analysis shows that bread contains around 35 per cent of moisture. Stale bread naturally would contain a less percentage, but approximately not far from one-third water. In a good hard grain feed there should not be to exceed ten per cent of moisture. This factor must be taken into consideration in figuring actual feed values. With stale bread at two and a half cents per pound and wheat at three cents, wheat is much the cheaper feed. Excepting possibly for young chicks, there is no advantage, in fact the reverse, for actual experiments have shown that the cooking of feed for animals as a rule lowers its nutritive value.

However, w quote a portion of Mrs. Larson's letter:

"Stale bread, dry, soaked in milk or water, has produced such excellent results at less than a third the cost of grain that both the large and small poultry raiser will find it very beneficial to his flock and purse. Stale bread can be bought at from one and a half to two and a half cents per pound, and if bought in large quantities, even cheaper. A large gunny sack of bread will average about 40 cents. Stale doughnuts and snails may be bought for the same price. One regular ten-cent loaf, if soaked in either milk or water, will feed 12 hens at a feeding. The water that has been poured off vegetables may be saved, and is found very helpful where milk cannot be obtained. For baby chicks there is nothing to be found that will promote the growth that bread and milk does.

"Soak the bread first in warm water and ring out dry. Take either sweet or sour milk and pour on just enough to make it soft, but not enough to make it sloppy. Feed on clean boards and be sure there are enough boards so the chicks will not crowd. One half loaf of bread will feed 55 baby chicks the first week and a half, it fed in small quantities four times a day while they are small. Keep adding to the amount of bread gradually until at the end of two months you are feeding one and one-half loaves. Make this into two feedings. I always feed a small amount of grain before feeding them the bread. This forms a grit and helps digest it more readily, and the bread does not stick together in the crop. I have found chickens fed in this way, with but little grain and plenty of green stuff, to lay at four and a half and five months of age. They must always have plenty of grit before them. Clean ashes are found fine to let them pick the bits of charcoal and grit from, also fine for dusting purposes.

For Rabbits

"For rabbits bread fixed the same as it is for baby chicks (except do not use the sour milk) and fed in small amounts will keep them very fat and make the meat a fine flavor. One loaf will feed eight grown rabbits."

NATIONAL EGG LAYING CONTEST AT MOUNTAIN GROVE, MISSOURI

By C. T. Patterson

April report.—The contest is moving along nicely, the hens making a record average of 20.88 eggs per hen for April, which is the highest average ever made in any contest at this place.

Many ties occurred for the five highest places for April. The honors were distributed among many varieties. The pens occupying the five highest places for April are as follows: S. C. W. Leghorns, Pennsylvania, 130 eggs; Barred Rocks, Missouri, 124 eggs; White Wyandottes, Missouri, 124 eggs; White Rocks, Missouri, 124 eggs; S. C. W. Leghorns, Missouri, 124 eggs; Missouri White Fluffs, Missouri, 120 eggs; S. C. W. Leghorns, Missouri, 119 eggs; Black Orpingtons, Missouri, 119 eggs; S. C. Reds, Iowa, 117 eggs; R. C. R. I. Whites, New Jersey, 117 eggs; S. C. W. Leghorns, Pennsylvania, 117 eggs.

The hens holding five highest places for six months are as follows: Pen 35, White Wyandotte, Missouri, 152 eggs; Pen 11, Barred Rock, Missouri, 148 eggs; Pen 29, Buff Orpington, Missouri, 142 eggs; Pen 35, White Wyandotte, Missouri, 142 eggs; Pen 19, R. C. R. I. White, New Jersey, 140 eggs; Pen 28, S. C. Red, Iowa, 138 eggs; Pen 52, S. C. White Leghorn, Missouri, 138 eggs.

All hens in the ten highest producing pens to date have averaged more than 100 eggs each in the six months.

MORE CROPS

In these days of war and strife, the things we hear most about are more crops, and more abundant crops. Some eminent personage has said, "Whether for peace needs or for war necessities the use of fertilizer is the basis of crop production." The truth of this saying no one knows better than the man who uses Hauser's Organic Fertilizers. He gets more crops, more abundant crops and better crops.

Don't delay, communicate with Hauser Packing Company about your fertilizer needs, use fertilizer and get results.

THE FLAG

Your Flag and my Flag!
  And how it flies today
In your land and my land
  And half the world away!
Rose-red and blood-red
  The stripes forever gleam;
Snow-white and soul-white—
  The good forefather's dream;
Sky-blue and true blue, with stars to
    gleam aright—
The gloried guidon of the day; a shel-
    ter through the night.

Your Flag and my Flag!
  And, oh, how much it holds—
Your land and my land—
  Secure within its folds!
Your heart and my heart
  Beat quicker at the sight;
Sun-kissed and wind-tossed,
  Red blue and white.
The one Flag—the great Flag—the
    Flag for me and you—
Glorifies all else beside—the red and
    white and blue!

Your Flag and my Flag!
  To every star and stripe
The drum beats as hearts beat
  The fifers shrilly pipe!
Your Flag and my Flag—
  A blessing in the sky;
Your hope and my hope—
  It never hid a lie!
Home land and far land and half the
    world around,
Old Glory hears our glad salute and
    ripples to the sound!

—Wilbur D. Nesbit.

THE GUEST OF HONOR

By Anne McQueen in Youth's Companion

MR. TILLER, seventy years old and spry for his age, sat on a box in the barn, patiently sewing upon a curiously shaped bag, patterned after the one he had carried on many long marches, back in the sixties.

Little Mary Ellen sat on the floor at his side, ready to thread her grandfather's needle. The rest of the family were occupied with their various duties; the father and the boys were at work in the fields, the mother was busy in the kitchen; only Mr. Tiller and Mary Ellen, one of whom was considered too old to work, and the other too young, were exempt from labor, and they kept each other company with great satisfaction.

"I belonged to the infantry, Mary Ellen," explained the old man to the child, who was a most interested listener. "And marched for almost five years. With arms, mind you Now what's to hinder a man with his faculties marching a trifle of two hundred miles to the reunion, toting nothing but this knapsack? Why, it's not worth considering! I'm not blind, neither am I deaf or dumb, and I could keep up row for row with your pa any day—only he's so hard-headed.

"There now, Mary Ellen, one more needleful, and I reckon you and I will be done with our job; and a pretty fair one we've made of it, too."

"Are you going as soon as your bag is sewed, grandpa?" inquired Mary Ellen, as she laboriously threaded the needle once more.

"Hush!" whispered the old man, warningly, and he raised his hand to his ear to listen. "Peep out and see if that isn't your pa and the boys coming from the field, honey."

After reconnoitering, Mary Ellen reported that it was only the red steer pulling shucks through the cracks of the corn-crib; and the two resumed their occupations.

"You see, honey," Mr. Tiller explained to the little girl, "if your pa or ma or the boys were to come across us making this knapsack, it might interfere with my plans. I'm aiming to light out in the morning, Mary Ellen."

"But you'll sure and certain come back, won't you, grandpa?" asked little Mary Ellen. Her lips quivered, and her blue eyes showed signs of tears.

"Now don't you cry, honey!" implored the old gentleman. "Grandpa'll come back; of course he'll come. How could he get along without his little Eyes? But you see, honey, I've never been to a reunion yet. I've meant to go every single year, but crops were a failure, or they didn't fetch a good price—something always turned up to prevent. So now, being past seventy, and living on borrowed time,"—he pondered deeply, seeking an expression that would not alarm seven-year-old Mary Ellen,—"maybe I won't be able to report at roll-call next time.

Somewhere in California

The beginnings of a dairyman and a dairy.

And as the boys are going to meet right here at home, a matter of two hundred miles away, I decided I'd say nothing about it to your pa and ma, who'd be sure to raise objections, but just light out and march, as I did when I was in the infantry.

"I have ten dollars that it took me considerable time to save—pension money is always handy to use about the farm; with that I'll buy a little truck to eat. Marching light, I aim to get there in plenty of time. And I'll write your pa and ma a card every now and then, to let you all know where I am along the road and when I get to the reunion. Think of the drums beating and the colors flying, and me marching along with the boys of our old regiment, with the governor himself reviewing us! Mary Ellen, I can hardly wait!"

Drawing an ecstatic breath, Mary Ellen looked bright-eyed into the future, and beheld a glorified grandfather marching along with soldiers in beautiful attire—wonderful to behold!

"But you won't forget to bring me a doll, grandpa?" she reminded him.

"Not I!" vowed Mr. Tiller. "I'll certainly fetch you a doll—in this very knapsack. Only you mustn't forget not to breathe a word to your ma and pa till I'm out and gone. And then you must tell them just what I've told you: that grandpa's gone to the reunion, and 'twon't be any use for anybody to try and fetch him back; and that he'll certainly write as soon as he gets there."

That night old Mr. Tiller pottered stealthily about in his room, making

Uni-Lectric
GASOLINE ELECTRIC UNIT
LIGHTING SYSTEM

Electric Light for Your Farm

Uni-Lectric lighting plant generates standard 110-volt direct current; operates from one to fifty lights, electric motor, electric iron, vacuum cleaner, electric toaster, force pump, churn, washing machine, etc. No Batteries—No Switchboard—and a better machine for less money. High speed gasoline motor, generator and automatic governor, all complete in one small, compact unit. Uses standard lamps and fixtures. Simple, easily installed, dependable, economical. Costs less than other systems to buy and to operate.

When You Buy Home Furnishings from Barker Bros. in Los Angeles You Are Assured QUALITY Goods and Not "Mail Order" Merchandise.

Many concerns catering to mail order customers carry what is known to the trade as "mail order goods"—a grade made and designed to meet keen competition and afford highest possible margin of profit at the same time.

With Barker Bros. it is different. Merchandise intended for any kind of sale other than by regular selection on the floors of this store are never selected by Barker Bros. no matter how alluring the wholesale price or how great the possible profit from their sale. Every article distinguished by a place in our stock must first pass rigid inspection and possess the basic element of QUALITY which for nearly 40 years has been associated with the offerings of this house.

The same high grade goods afforded Los Angeles people are open to the out-of-town buyer with every assurance of satisfaction as though selected in our store in person.

If you cannot visit our store, you will find it distinctly advantageous to buy through our MAIL ORDER DEPARTMENT. You are urged to write, telling us just what you want, etc. We will respond quickly, intelligently and courteously. We can save you money on furniture and everything in home furnishings.

Write for our 48-page catalogue of Draperies, Floor Coverings, etc., just off the press.

WE PREPAY ALL TRANSPORTATION CHARGES to any railroad, express or parcel post point in the United States, within two hundred and fifty (250) miles of Los Angeles and make liberal allowance for transportation charges beyond 250 miles, anywhere in the world.

THE
AMERICAN BEAUTY DUST SPRAYER

SAVE YOUR FRUIT

Red spider and mite, mildew, rust, and insects are at work on vines and trees. Dust now, before they get a start. Dust sprays are better than liquids, are cheaper and more easily and quickly applied. Serve your country by protecting your crops.

GARDEN PESTS

Bean and pea mildew, rust, red spider, bugs and worms on truck and field crops.—kill them all with dry insecticides.

"A Puff in Time Saves the Vine"

The American Beauty is the fastest and easiest working knapsack duster. Throws a perfect cloud—no lumps, no clogging. Uses least dust—does most work. Ask your dealer for it. Or send us $11.00 for vineyard and garden size, $13.50 for orchard size. We ship all charges paid. Refund if not pleased after week's trial.

We Fully Guarantee Every Machine

Salt Your Hay

A little commercial salt (only 20 pounds to the ton), sprinkled in a hay stack or in baled hay, prevents mildew or mold. If you feed the hay, stock likes it better; if you sell it the hay holds its weight and sells for more. Salt costs less than hay and makes hay better.

We sell commercial salt, Morton's Salt Blocks and lump Rock Salt. Send for our free booklet "THE RELATION OF SALT TO STOCK FEEDING."

many small preparations; and the next morning, when the big Plymouth Rock rooster sleepily crowed his first announcement of daylight, he crept softly out of the house, through the dew-drenched flowers of his daughter's yard, and marched bravely forth to the reunion, two hundred miles away!

Mary Ellen, tearful from loneliness, yet jubilant at the thought of the coming doll, faithfully repeated her grandfather's message: "And you all mustn't follow grandpa, for he isn't coming back till he sees the reunion. And he's going to fetch me a big doll in the knapsack that we sewed in the barn—the knapsack like the one he had in the war."

But not heeding this imperative command, Mary Ellen's father started immediately in pursuit of his father, only to return the next day without him; for old Mr. Tiller, despite his valiant threat, had little doubt that his family would follow him, and had therefore used a little strategy in the matter. He walked in the grass by the roadside, that they might not see his footprints; when he judged that the pursuers would be well on the way, he turned aside into the woods, where he sat on the soft grass in a sunny glade, reading the latest number of The Veteran, and lunching off the cold biscuit and bacon he had abstracted from the home cupboard. He spent the day in much content; and when darkness fell, he made a bed of soft and fragrant pine boughs, upon which, wrapped in his blanket, he slumbered peacefully through the warm loveliness of the summer night.

(Concluded next week)

LOOKING AHEAD

Written for California Cultivator
By Mrs. E. C. Hawley, El Cajon

IT has been the hardest winter on growing gardens I have seen in California, yet the high cost of living has not hurt our family table. We have fed a family of five at an average cost of seven dollars a month this winter. We keep two cows and 25 hens and from eggs and butter sold have bought their feed and paid our grocery bill as well. You want the answer? Well, it is garden stuff and the careful preparation of same for use out of season. The summer of 1916 my daughter (a high school girl) and I "put up" over 350 quarts of fruit and vegetables. Total cost was our work and fuel.

I have proven that all fruits keep without sugar and the natural flavor is retained much better.

I begin early and care for all seconds or culls of vegetables or fruit.

We raise a variety of beans, but do not can them for we like them all as dry beans. Have three kinds of Kentucky Wonder, besides red, small white and Blackeye. And not anything I can fix pleases my school children more than a kettle of Blackeye soup on back of stove when they come in from school. Sweet corn is also liked much better dried than canned at our home, and we always dry a quantity.

I can squash, pumpkin and tomatoes. And the garden always supplies onions, beets, carrots, turnips and cabbage, and we have now asparagus and rhubarb.

You can readily see we have a good variety and I consider it my business to keep my home and provide well for the nourishment of my family.

I have always used the open kettle method of preparing fruit or vegetables, thoroughly cooking, and having jars ready, filling from open kettle, boiling hot, sealing immediately, and I never have any spoil.

PRIZE CONTEST

The next prize contest in the household department will be "more of the same"—which is, of course, economy. The government, the newspapers—everybody have been telling us how to save and make things go farthest. And we have received much help from all these suggestions. But I wonder if we can't show them all a trick or two. We've been "economizing" for some time—there's nothing new about it. And we've worked out some very valuable economies, and some not so valuable perhaps. Anyway we all have our "pet economies," dear to our own hearts, our own special way of playing the game.

Is it dropping all clean potato parings, outside leaves of lettuce and cabbage, beet tops, etc., in the soup pot, using up burnt matches, putting away all string and paper that comes to the house, using every drop of grease, or what, or what else?

Cash Prizes

For best article on "Pet Economies" $2.00 cash; second best, $1.00; for all others published, three months extension of subscription.

Send Early

Send your contribution as soon as possible. All should be received by Household Department, California Cultivator, Los Angeles, not later than Thursday morning, May 24. Please write on one side of paper only.

HIGH COST OF FOOD NECESSITATES JUDICIOUS MANAGEMENT

Purchasing food supplies and planning and preparing three meals a day has always been a problem, but with the increase in food prices the problem is becoming more difficult every day. The abnormal price of certain foods leads the careful housewife to seek substitutes, but if she does not know the relative values of the different foods she cannot make her substitution intelligently. A knowledge of the part that each of the different classes of foods performs in the body upkeep is essential. Without this knowledge serious mistakes may be made. Miss Bab Bell of the Missouri college of agriculture makes a few suggestions relative to decreasing the cost of living.

Make a thorough study of the different classes of foods and the function of each in the body.

Plan meals carefully so that foods are not duplicated. For instance, do not serve Irish and sweet potatoes in the same meal; cheese and meat; rice and potatoes; spinach and lettuce; navy beans and meat.

Substitute in part, corn starch for eggs; rice for potatoes; meat substitutes for meat; some good oil for olive oil; some product for butter, especially in cooking; cornmeal for wheat flour. Milk is one of the best foods and consequently can be substituted for higher priced foods. Skimmilk has a high protein value.

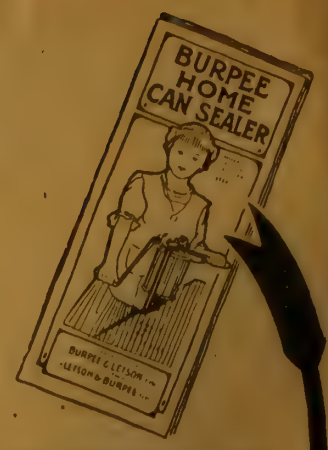
The cost of living may be reduced by:

Purchasing food supplies in large quantities when a good storeroom is available, and by purchasing foods in season.

Preparing the exact amount of food needed. Some foods cannot be warmed or made over.

Planning meals to utilize all "left overs" and thus reducing the waste which ordinarily goes to the garbage can.

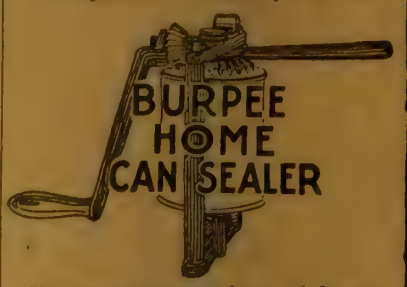
Training children and adults as



SECRET OF SUCCESSFUL

HOME CANNING

lies in perfect sealing. To handle dangerous solder and acid successfully requires experience. Lack of this experience causes poor sealing and failure. No experience is necessary with the



The greatest canning device of the age

No Solder—No Acid

The Burpee Sealer brings the sanitary non-solder, non-acid tin can into the farm or home kitchen and is a guarantee of perfect air-tight sealing. With each machine we send full directions, including a book of recipes, compiled with the assistance of experts of U. S. Dept. of Agriculture.

The machine is a complete sealing device requiring no expensive equipment. So simple a child can operate it. Lasts a life time. Clamps to any kitchen table. Covered by a money-back guarantee.

HOW HIGH IS YOUR KITCHEN SINK?

Can you stand easily erect at your kitchen sink or do you find yourself constantly drooping over in a cramped and back breaking posture? Strange as it may seem 999 sinks out of 1000 —on a very liberal estimate—are built according to the carpenter's rule for "the way it's always done," instead of according to the height of the mistress who will spend hours every day bending over it. A bulletin recently issued by the Missouri agricultural college discusses this point, giving the following practical directions for raising working surfaces to comfortable height:

As a rule working surface—tops of stoves, tables, sinks—are too low for the person of average height. This causes straining of the muscles and undue stooping and is largely responsible for tired backs and rounded shoulders.

Tables too low may be placed on blocks of wood or the legs may be spliced with gas pipes or small slats. The stove may be blocked with brick or cement. Legs on a stove are generally regarded as unsatisfactory. The space beneath too often proves a catch-all for overshoes, mittens, and domestic pets.

Most sinks, especialily, are too low for a person of average height. The bottom of the sink should not be less than thirty inches from the floor if the housewife stands at her dishwashing.

The height of any working surface will, of course, vary with the height of the worker and whether or not she sits or stands at her work, but in general it should be about thirty-two inches for a woman of average height (five feet, five inches). It is wise for each housewife to perform the same task at different heights and see at which one she exerts least effort.

CARING FOR LAMPS

Much kerosene trouble lies in the lamp or wick rather than in the oil. If the flame is uneven the fault is usually in the trimming; or the burner may be coated with carbon scales which crumble down upon the wick, and by their pressure cut off the flow of kerosene. Such a burner should be thoroughly cleaned and boiled, then dried and brushed clean of lint.

A lamp should never be allowed to burn dry. Besides destroying the wick, it chokes the burner with unconsumed carbon and renders a thorough cleaning necessary. With low-test oil, too, there is considerable danger in permittng the reservoir to become low, as the heat evolved converts the oil into gas as rapidly as there is room for it to form, and the larger accumulation soon becomes a serious menace.

A wick should be trimmed by scraping with a dull knife, rather than by cutting; then the carbonized fibers will all be removed.

If the wick is boiled in vinegar and then dried thoroughly, it is relieved of its tendency to smoke.

Never blow down a chimney to extinguish the flame. Blow across the top, or, if that is inefficient, blow against the hand held near the top. It may save a cracked chimney.

The chimney of a lamp should never become hot at the bottom part, below the flame. If it does it indicates a hot burner and is a danger signal. Usually one can remove a chimney from a lighted lamp by grasping it at the bottom.

Lamps should be filled in the morning; then there is little space for gas to accumulate during the day. If this is neglected do not fail, before lighting the lamp in the evening, to remove the burner and agitate the wick enough to drive the accumulated gas out before lighting. This may save an explosion. For a similar reason lamps should be set away, during the day, in a moderately cool place.

Where good 150-test water-white oil is used many of these precautions are unnecessary. They are recommended because of the variation in oil and its impurities. Some grades of oil, occasionally sold for the best, are much more highly charged with dangerous gases than others.—Farm Journal.

LEFTOVER COFFEE

Coffee left over from breakfast or dinner, if saved each day and kept in a bottle, can be used in various ways.

Coffee jelly is time-honored as a utility cold coffee, but there are many other and less common recipes that it would pay the thrifty housekeeper to list.

A delicious, if uncommon, dessert, is coffee souffle. One and a half cups of coffee, half a cup of milk, one tablespoon of gelatine, two-thirds of a cup of sugar, three eggs, one-eighth of a teaspoon of salt. Soak the gelatin one hour in cold water, mix it with the coffee, milk and half of the sugar. Heat in a double boiler. Beat the yolks of the eggs slightly, add the salt and the remainder of the sugar to these and pour slowly into the coffee mixture. Cook until thickened, then add the whites of the eggs, stiffly beaten, and half a teaspoon of vanilla. Beat thoroughly and turn into a mould.

HOUSEHOLD QUERIES

Drying Blackberries

I am very much interested in the articles on canning and drying fruits and vegetables. I wonder if anyone can tell me through the Cultivator how to dry blackberries, and how about drying green beans? I remember eating both of these when I was a girl and thought they were fine.—Subscriber, Pomona.

The method of drying beans is described by Prof. Cruess on page 534 of Cultivator of May 12, which appeared after this letter was written. This article will be a very valuable one to save for constant reference this year. About drying blackberries, who has tried it? Will not some of our subscribers answer the Pomona inquirer's letter?

KINDNESS WITH A VENGEANCE

A young teacher gave the children a talk on kindness to animals. The next day, when she was busy at her desk, she felt a little hand tugging at her sleeve.

"Why, Pietro," she exclaimed, "what is the matter?"

"Nothing, teacher. I just wanted to tell you how I was good to dumb animals yesterday."

"Why, isn't that nice, Pietro! Just what did you do?"

Pietro drew himself up to his full three feet, and proudly declared, "I kissed the cat!"

IT ALL DEPENDS

It all depends on what you're living for. If you're living only to get ahead, then procrastination is a thief; but if you're living to enjoy life along the way, it is sometimes a gift-bringer.

COOLNESS

There's nothing so cool as an oil stove for summer cooking. All the heat is concentrated on the cooking and not radiated about the kitchen.
Cooks everything any wood or coal range will cook, and cooks it better, because of the steady, evenly-distributed heat.
Use it all the year 'round—more convenient than a wood or coal stove, and more economical.
The long blue chimneys prevent all smoke and smell.
In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

SALT LAKE ROUTE

REDUCED FARES FOR SUMMER TRIPS

For vacation or business trips the Salt Lake Route offers, on May 31st and certain dates in June, July, August and September, round trip tickets at greatly reduced fares to many Eastern points. For instance, to Chicago and return, $80.00; New York, $118.20; St. Louis, $77.50; St. Paul, Minneapolis, $84.45; Missouri River, $67.50; Denver, $62.50; Salt Lake City, $40.00, and many others.

Return limit 3 months, but not after Oct. 31.

The ideal vacation trip is to the American Wonderlands, Yellowstone National Park and Glacier National Park, both easily reached via Salt Lake City.

Round trip fares are reasonable and the world has no more marvelous sights.

Full information of all these trips, train service, etc., at all offices of the

SALT LAKE ROUTE

Los Angeles Office 501 South Spring St. Phone Main 8908, Home 10031.

P. S.—The American Express operates over Salt Lake Route.

APOLLO FIREPROOF ROOFING DURABLE

Highest quality, standard patterns—specially adapted to farm buildings. Formed from **Apollo-Keystone Copper Steel** Galvanized Sheets.

These sheets insure greatest service and rust-resistance for Roofing, Siding, Silos, Culverts, Tanks, Flumes, and exposed sheet metal work. The Keystone is added below the regular Apollo brand when Copper Steel is used. Apollo Roofing Products are sold by weight by leading dealers. Send for free "Better Buildings" booklet.

Time to Re-tire? Buy Fisk

Time to Re-tire? (Buy Fisk)

How About That Spare Rim On Your New Car?

BEGIN right now by getting a Fisk for your spare rim. Thousands of today's users of complete Fisk equipment began years ago with the purchase of a single tire. Experience proved to them that Fisk is the best dollar-for-dollar tire value on the market—and the standard of Fisk Quality is higher today than ever. Get at the bottom of the tire question—learn that *"when you pay more than Fisk Prices you pay for something that does not exist."*

The Meaning of Fisk Tire Service

A special feature of Fisk Tire Value is the policy of Free Service through Fisk Branches in more than 125 principal cities throughout the country. There are Fisk Branches in your State, where your home dealer buys direct and is always sure of promptest attention to your wants. And when the Branch is convenient you can go there any time, *whether you use Fisk Tires or not,* and make use of the only uniform and complete Free Tire Service in the country. No charge at any time except for supplies and actual repairs.

Take the first opportunity to get acquainted with *Fisk Service,* Fisk Organization, Fisk Methods and Fisk Products. If you do not find a Fisk Branch in the partial list below that is convenient to where you live, write for complete list—there may be one nearer you.

How Can We Make More Humus?

Los Angeles Section of American Chemical Society Listens to Addresses by Doctors Breazeale, Kelley and McBeth of the Department of Agriculture, in Which Cover Crops Are Discussed

THE members of the Southern California section of the American Chemical society touched lightly on chemistry of petroleum and its various derivatives, and chemistry subjects other than agriculture, at its last banquet and monthly meeting in Los Angeles. Agricultural chemistry and somewhat of physics had the boards for the evening. Addresses were made by Dr. J. F. Breazeale, Dr. W. P. Kelley and Dr. McBeth, all of the department of agriculture, engaged in special soil investigations at Riverside.

Dr. Breazeale referred to the problem of soil fertility as the greatest which now confronts the American farmer. His discussion had to do with the problems which confront the soil chemist, and in this discussion he referred to the theory of Milton Whitney, who is soil physicist and chief of the bureau of soils, in effect that there is little difference in productive value of various soils from the standpoint of the chemical content, but that quantity and quality of crops are more influenced by toxic substances in the soil than by elements of fertility such as nitrogen, phosphorus and potash. The remainder of Dr. Breazeale's address had so much to do with ions, cations, anions, electrolysis and other scientific questions of soil make-up that the laymen became hopelessly involved. Dr. Kelley, who was supported by Dr. McBeth in an informal talk, gave us a shock in the matter of nitrate formation in soils being slower where green manure crops are permitted to ripen.

At one time orchardists generally clung to the idea that green manure crops should be plowed under while lush and green. Decay was almost immediate, the nitrates were quickly released and less future trouble was experienced with the orchard. Then came the idea that thoroughly ripened green manure crops, in which cellulose was developed, gave a far greater degree of humus and resulted in more fertility to the soil.

Now the scientists, by a series of theoretical reasonings, make a showing that ripened, woody green manure crops in which cellulose is developed to the fullest, when plowed under give opportunity for a war of cations and anions which result in slower formation of nitrates. That there was no ultimate loss was agreed. However, it is better that Dr. Kelley should state his case.

* * *

EFFECTS OF ORGANIC MATTER ON NITRIFICATION

By Dr. W. P. Kelley

There is one factor bearing on nitrification that deserves especial mention. I have reference to the effect of carbohydrate. It has been known for some time that soluble organic matter tends to interfere with nitrate formation in artificial cultures and especially in nitrification studies in solution. Likewise it has been shown that the addition of any considerable amount of such carbohydrates as sugar and starch also tend to depress nitrate formation. It has become known in recent years, however, that still another class of carbohydrates has the power of interfering with nitrate formation and that to a marked degree. The class referred to is the celluloses.

In all probability the several classes of carbohydrates interfere with nitrate formation in soils for more or less the same reason, namely, through stimulating the non-nitrifying organisms. In the presence of carbohydrate certain organisms are stimulated which have the power of feeding on nitrates, thus decomposing and reducing the nitrate supply that is present. Therefore the amount of nitrate that is allowed to accumulate in the soil is correspondingly reduced. This aspect of nitrification has a very decided practical bearing for it is now thoroughly established that the incorporation of any considerable amount of organic materials high in cellulose or other carbohydrates, such as are found in barley straw and strawy materials in general, has a tendency to prevent the accumulation of nitrates in soils. I have found, for instance, that barley straw, bean straw and certain types of manure tend to act in this way and others have noted the same thing for other substances.

This need not be interpreted to mean that organic matter should not be added to soils. Such is far from the case, but rather that organic materials high in cellulose in particular will tend to prevent the accumulation of nitrate for a limited time following its application. Consequently it would seem that such materials as barley straw and strawy manure might be more advantageously applied some weeks in advance of the time when active growth is demanded. If applied in this way the initial decomposition and fermentation of the carbohydrate material will have time to take place, and later on normal nitrate accumulation may be expected. In addition, it is important to state that the use of green leguminous cover crops does not ordinarily interfere with nitrification, but on the contrary actively stimulates nitrification. I have found, for example, that nitrification takes place rapidly from the mere use of the green cover crops such as Melilotus indica, purple vetch, Windsor beans, etc.

Concrete Septic Tank Modern Sewage System

By H. J. Baade, Farm Adviser of Napa County

IN order to have the best possible sanitary conditions on the farm there should be a practical sewage disposal system. The best and most satisfactory, as well as the most economical, sewage disposal plant is the septic tank. There are many practical types now being built. The simplest and the one most frequently built contains two compartments. Two hundred such tanks have been built on the farms of Napa County within the past ten months. To date we have received no complaints from any of these. The conveniences these tanks make possible in the farm home are making life in the country worth while. Every farm home should have an indoor toilet, sinks, bath, and stationary washtubs. These can be connected directly with the septic tank.

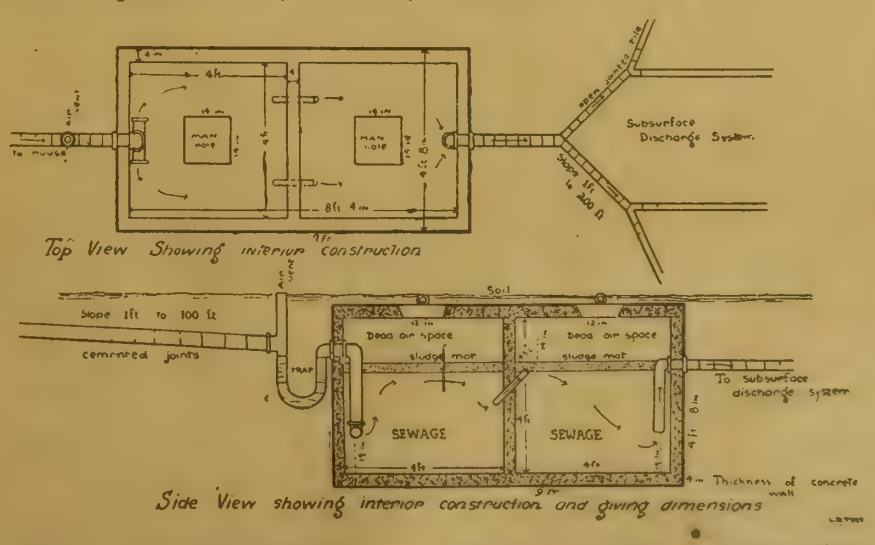
The size of tank recommended is one that is large enough to take care of 70 gallons of sewage per capita per day. The following table gives the sizes which have been found to work satisfactorily:

Six persons — width, four feet; length, nine feet; depth, five feet.

Eight persons—width, four feet; length, 10 feet; depth, five feet.

Twelve persons—width, four feet; length, 10 feet; depth, six feet.

Twenty-five persons—width, five feet; length, 14 feet; depth, six feet.



Side View showing interior construction and giving dimensions

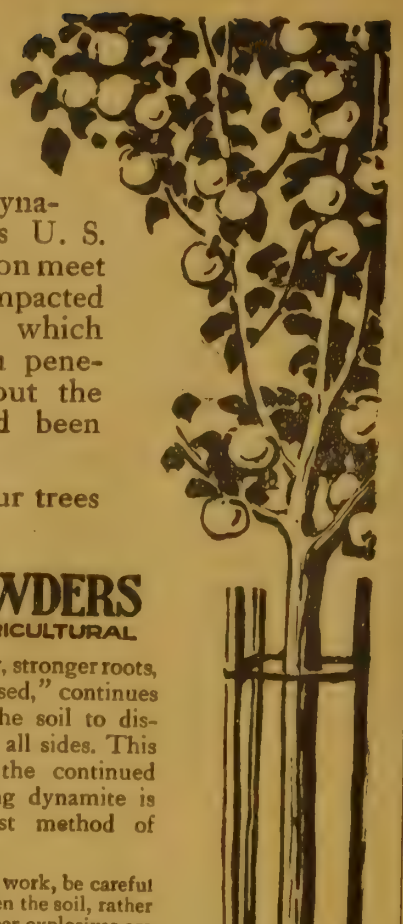
The sewage from the house is discharged into the tank through sewer pipe. The bacteria which decompose the sewage become established by a natural process. It is not necessary to add chemicals. Lye and strong disinfectants should not be thrown into the sewer in large quantities since such materials would destroy bacterial action. Nor should storm waters be run through the tank because such excessive water would carry sewage out of the tank before bacterial action would be complete. The decomposition is completed in the tile distributing system into which the liquid flows upon leaving the septic tank. From these tile the liquid seeps into the soil in a purified form.

These tanks are of concrete made of either gravel and cement in the proportion of one to five; or of sand, cement and crushed rock in the proportion of one-two-three. In mixing care should be exercised to have it of a mushy, wet consistency. It should be thoroughly spaded in the forms, the walls being 4 inches thick throughout or thicker if desired. Reinforcements of iron rods or heavy wires are put in the wall 12 inches apart.

Interior of tank should be plastered with mortar made of one part cement to three parts sand to make it waterproof. The tile and sewer pipe are four-inch. The manholes in the tank can be round or square. If square, they should be 14 inches; if round, 12 inches in diameter.

Continued on Page 603

Would you plant your fruit trees in large tubs?



"Without the use of dynamite in tree-planting," says U. S. Bulletin No. 38, "the roots soon meet with the smooth and compacted sides of the hole, through which they have great difficulty in penetrating. The tree is in about the same situation as if it had been planted in a large tub."

But when you plant your trees in holes blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

the trees will grow faster, develop deeper, stronger roots, and bear earlier. "When dynamite is used," continues the bulletin, "cracks are formed in the soil to distances of five or sometimes six feet on all sides. This makes the very best conditions for the continued growth of the tree. For tree planting dynamite is recommended confidently as the best method of preparing the soil."

In selecting explosives for your orchard work, be careful to get those that will crack, powder and loosen the soil, rather than pack it or throw it in the air. The proper explosives are the Giant Farm Powders. There are two of these—Eureka Stumping Powder and Giant Stumping Powder—both improved forms of dynamite, made especially to meet western agricultural conditions. They are sold by distributors everywhere. Ask your dealer for them.

Smyrna Figs and Caprification

By I. J. Condit

FIG varieties in California include three common classes or types, viz. common figs, Smyrna figs, and Caprifigs.

The common type of fig includes such varieties as the Mission, Adriatic, Brunswick and Brown Turkey, which ordinarily set two or sometimes three crops each season, and these crops mature without any attention being given them as far as pollination is concerned. The seeds are commonly hollow and do not contain kernels.

The Smyrna type of fig produces fruit which forms on the twigs but these fruits drop off unless pollinated (or caprified as it is usually called). If the fruit is caprified, each fertilized flower within the fig develops a seed containing a fertile embryo. It is this fertile seed which gives the Smyrna fig its superior flavor and quality, especially when dried.

The Caprifig is the wild or goat fig of Southern Europe and the fruit is different from that of the other two types mentioned above, by containing an abundance of male or pollen-bearing flowers as well as numerous gall flowers, which furnish a home for a small insect known as the fig wasp, blastophaga. These male flowers are found abundantly only in the spring or profichi crop of the ordinary caprifig. This crop matures in the San Joaquin Valley about the second week in June (later along the coast) and is used in caprifying or pollinating the second or main crop of the Smyrna fig. The figs of the over-winterting crop of the ordinary caprifig tree (known commonly as the mamme crop) do not contain pollen and cannot therefore be used in caprifying the first crop of the Smyrna tree. The first Smyrna crop consists of comparatively few figs which mostly drop off.

A variety of caprifig known as Pseudocarica is now being grown. The caprifigs of all three crops of this variety bear pollen, and the mamme figs under favorable conditions may be used for caprifying the first crop of the Smyrna fig which commonly sets the first week in April.

A single caprifig tree may produce its crops in sufficient regularity so that the fig wasp as it matures may pass from one crop to the other and keep the tree supplied with caprifigs. For best results, however, it is advisable to have two or three varieties of caprifigs in order to lengthen the caprifying season in June and insure the presence of the fig wasp throughout the year.

The process of caprification is simple. The caprifigs are mature and ready to use when the first insects begin to issue from the eye of the fig. The males are wingless and are the first to issue from the gall flowers. The proper stage of maturity to pick the caprifigs can best be learned by cutting open two or three; those in which the brownish male insects are seen crawling around are in the proper stage. The caprifigs should be picked from the trees in the late afternoon, kept in a shady cool place over night, and distributed in the Smyrna trees early in the morning. The winged female insects issue mainly between 9 and 12 a. m. As they leave the caprifigs they become dusted with pollen; they enter the Smyrna figs and crawl over the flowers in a vain attempt to find suitable flowers in which to deposit their eggs. The Smyrna flowers thus become dusted with pollen, and the resulting fertilization causes the fruit to set. The eggs of the insect are deposited only in the short styled flowers of the caprifig, which is the natural breeding place of the insect.

The season for caprifying the second crop Smyrna figs generally extends over three weeks. The caprifigs are placed in strawberry or wire baskets suspended in the Smyrna trees, the number depending upon the size of the tree. The best commercial results are secured by distributing the caprifigs as follows: At five years of age supply five caprifigs to each tree once a week or oftener for three weeks; a ten-year-old tree should have 15 caprifigs every three days. Growers who have no caprifig trees and only one or two Smyrna trees must depend upon getting caprifigs from their neighbors or have them shipped in from a distance. Mamme figs which are needed in April to colonize the caprifig trees ordinarily sell for about five cents each. Profichi caprifigs in June are usually sold for about half a cent each.

The following capri varieties are recommended: Roeding Number three or Markarian Number two for early crop; Magnissalis, Pseudocarica, or Markarian Number one for mid-season; and Milco for a late crop. The early varieties caprify the largest percentage of the Smyrna crop. Five caprifig trees for every hundred Smyrna trees should prove sufficient. On account of the greater difficulty and expense of caprification it is not advisable to plant the Smyrna as a border tree. For the same reason one or two Smyrna trees should not be planted in the home fruit orchard unless a supply of caprifigs is available in the vicinity.

Cyclopedia of Horticulture Completed

The final volume of Bailey's Standard Cyclopedia of Horticulture is now being delivered. Cultivator readers who have deferred ordering this great work until the last volume is out may well consider its purchase.

The first one of the six volumes came from the press in 1914, or 14 years after the first volume of the first edition of the same great work. The former work was a four-volume edition. In it Editor Bailey writes that the purpose of the work "was to make a complete record of the status of North American horticulture as it existed at the close of the 19th century." In it the editor made an effort to include all species which are known to be in the horticultural trade, together with outlines of horticultural possibilities of various states and sections of the country. That book for years was the standard. The present cyclopedia is founded on the former compilation but at the same time is entirely rewritten, vastly enlarged and made more complete and more correct. In closing the preface to the present edition Editor L. H. Bailey says:

"It is not wholly with satisfaction that one puts forth a work of this magnitude. The responsibility increases with the largeness of the en-

terprise, for users do not readily purchase new and corrected editions of a work of this extent. Every care has been taken to present an accurate and faithful account, and this is as far as the responsibility can extend. The editor can not expect to make another cyclopedia of horticulture; but he hopes that these six volumes will comprise another step in the collecting, assorting and appraising of our horticultural knowledge."

The book is published by the Macmillan Company, New York, at $6.00 per volume, $36 for the set. Subscribers of the Cultivator who may wish to secure the book on monthly payments may have more complete information by writing the California Cultivator.

The Home Evaporator

Written for California Cultivator By W. F. Hewlett

PERHAPS a brief description of our small home evaporator which we have used four years and which is practically as good as ever, may be of interest.

We consider it one of the most useful articles on the ranch and would find it hard to do without one.

It is 30 inches wide, 11 inches deep, and 30 inches high, and is made of galvanized iron and strap iron braces.

The back and sides are solid and the front has two doors. In the top is an opening covered with wire netting through which the surplus heat escapes. Inside are ten double trays made of one-inch strips which form the frame, and over this is stretched a heavy screen. The heat passes up from the center of the bottom through openings at each end of the trays and also through center of trays and circulates through the netting of trays on which is placed the fruit or vegetables to be dried. The evaporator is made to cover two holes of an ordinary cook stove and the work of drying is hastened or retarded as it is placed directly over the firebox or moved to back of stove.

In our household my wife places the evaporator on back of stove while cooking the meals and moves it to the front when through cooking. Then by putting a little fuel in stove occasionally to keep up a slow, steady fire the work of drying is not much trouble.

Ours is an apple ranch, and every year we dry all the apples we need for our own use and some to sell. We dry corn, beans, squash, and in fact anything that can be evaporated, and for drying meat for jerky it is simply all right, as there are no flies to bother and pollute the meat. If there is anything that disgusts me it is to pass a place and see a lot of fruit or vegetables laid out for drying and the outfit covered with flies crawling all over it.

It seems to me that meat drying on the farm has been overlooked. Many a farmer has a calf or young animal to butcher, which he saves until cool weather or sells to some butcher and then pays two prices for fresh meat as he needs it. With this small evaporator butchering can be done any time of year regardless of the weather.

After saving fresh meat for home use and perhaps what a neighbor or two may want, cut the balance into one-inch strips convenient to place on the trays, dip in boiling salt water and place on trays, and in a few hours you have as fine jerky or dried beef as one could desire. The fat melts and runs into the lean meat and the product is one that would make anyone sit up and take notice if he had never tasted it before.

After the meat is thoroughly dried, we run it through a meat cutter, place in fruit jars and thus taken care of it keeps indefinitely. It is very convenient to use in cooking for soups, gravy, Irish stews, etc., and takes the place of fresh meat to a certain extent.

1916 Peaches Gone

Manager Niswander of the California Peach Growers' Association, is sending out notice that, "effective May 17, all grades and varieties of dried peaches of the 1916 crop are withdrawn from the market. From best information obtainable at this time, our stocks are exhausted. By June 1 we will have completed an actual inventory of stocks in our various plants throughout the state, from which we will deduct goods actually sold to this date and unshipped at that time, and should it develop that we have any surplus, announcement will be made. Do not anticipate our placing before the trade any further quantity of unpeeled peaches of the 1916 crop. We think, at most, we will have only a few tons, with assortments badly broken. We may possibly be in position to accept orders for eight or ten cars more of fancy peeled peaches. However, until further advised, we will decline any and all business."

Beans are being planted on stiff adobe land near Gridley.

ZEROLENE

The Standard Oil for Motor Cars

ASPHALT BASE—THE CHOICE OF EXPERTS

Factory experts, and leading coast distributors for all makes of cars, testify that Zerolene, correctly refined from California asphalt-base crude, gives perfect lubrication with least carbon deposit.

Less wear and more power because Zerolene keeps its lubricating body at cylinder heat. Less carbon because, being made from asphalt-base crude, it burns clean and goes out on exhaust.

Zerolene is the oil for *your* car—whatever the make—the oil for all types of automobile engines. For correct grade get our lubrication chart covering your car

Avocado Growers Meet

Annual Session of California Avocado Associatio Held in Los Angeles

THE finest exhibit of avocados ever made in California was that at the fourth annual meeting of the California Avocado Association, held in Normal Auditorium, Los Angeles, last Friday and Saturday. There were nearly 30 exhibitors of fruit and some of the exhibits were exceptionally large. At this season of the year when only the larger, thicker skinned varieties are available the number of those exhibited was surprising.

The most pleasing feature to the avocado growers was the fact that the membership of the association, which a couple of years ago was approximately 30 but had gradually increased to about 150 before the meeting, was augmented by over 50 new members and the list now is materially above 200, and this includes some of the representative fruit growers of California. When it is considered that the membership fee is five dollars per year it may be seen that these members are such because of keenest interest in the industry.

There are no very definite statistics, but as near as can be gathered from various sources, it appears that in excess of 15,000 avocado trees have been planted this season. Probably most of these have been used in the planting of exclusively avocado orchards. However, some were interset with lemons as a matter of insurance.

The annual business of the association was conducted, one feature being amendments to the constitution and another the election of the board of directors. These nine directors were elected for varying terms of one, two and three years. These elected are: H. J. Webber, F. O. Popenoe, Chas. D. Adams, T. U. Barber, Wm. H. Sallmon, E. E. Knight, W. L. Hardin, B. H. Sharpless, Thos. H. Shedden.

The directors have not yet organized but will meet at the home of Mr. Flinn of Monrovia June 2 and from their number elect a president and secretary. During the past year I H. J. Webber of the citrus experime station has been president and C. Adams of Ontario secretary.

The avocado is a new fruit in Ca fornia, though it is a native of Me co and Central America and has be very generally utilized in those cou tries. From an unknown fruit 15 yea ago it has rapidly assumed imp tance in California and is doubtle destined to become one of our mo important industries. Fifteen yea ago we had only a few unknown see lings; now growers have about 1 varieties from which to select. Th large number gives variation to t fruit exhibit and furnishes a fine e ample of man's skill in finding a producing varieties to meet his d mands.

QUESTIONS AND ANSWERS AS TO U. S. RECLAMATION

What acreage is irrigated under projects at the present time?

The area actually irrigated during 1916 was about 1,000,000 acres. There were 1,400,000 acres under contract and the service was prepared to supply water to 1,750,000 acres of land. The ultimate area to be irrigated by the projects at present under construction will be about 3,000,000 acres.

What is the total amount of material excavated and mileage of canals constructed?

The total amount of material excavated to December 31, 1916, including the amount of dams, levees, canals, etc., was over 145,000,000 cubic yards, and the total length of canals and drains was 11,200 miles, including 10,000 miles of irrigation canals and 1200 miles of waste-water ditches and drains.

How many canal structures has the service built and what proportion are of concrete and of wood and metal?

The service has constructed up to December 31, 1916, a total of 75,000 canal structures, of which 20 per cent were concrete. Of the flumes, 2300 of which were built, over 600 were of metal. About 5600 brides have been built and 6600 culverts. The amount of pipe laid in connection with structures and drainage was over 2,000,000 feet, or about 380 miles.

Protect Your Crops

Against the ravages of fungous disease and insect pests with the

SPARK SULPHUR MACHINE

Sublimed Flowers of Sulphur and powdered arsenate of lead —used in the SPARK SULPHUR MACHINE eradicates red spider on bean vines.

Thoroughly coats plants, bushes, trees and vines with the dry chemical—acknowledged by commercial growers and authorities on insecticides and fungicides to be the most effective method.

Send for free booklet just published. It contains the latest information on dry spraying and the SPARK SULPHUR MACHINE.

Ask for booklet "E" when writing. A postcard is sufficient.

Notes on Tree Growth in Blasted Ground

By J. R. Mattern

ONE in a judicious frame of mind may often wonder, after ten years or more of active propaganda by the powder companies for the use of explosives in preparing the ground for trees, just what the average results of such blasting may be. It is certain that literally thousands of planters of fruit trees have made use of the method. In some of the famous fruit sections of America blasting the ground has become the universal, standard practice.

An examination of a good many orchards where the trees are growing in land prepared for them by blasting shows first of all that the trees are anchored more securely. There is far less of that leaning away from the wind that characterizes too many orchards. It not only is unsightly—it often means the breaking down of the trees under their usual loads of fruit. I do not know whether this can be attributed to a deeper root system or to more extensive root systems. Probably it is a combination of both.

I have not observed that in young trees the blasing of the ground results in much thicker growth of trunk, though only a few trees have been measured within my observation to check up this point. But in older trees that are growing in the ground containing hardpan there is a decided increase in the thickness of the trunks of the trees where the ground has been blasted. Probably the young trees do not yet have vital need of the underlying strata of soil. Probably the trees begin to suffer from the lack of food and lack of water that stunts them and keeps them back only after they have thoroughly worked over the top soil within reach of the roots. In one instance apple trees over hardpan were lifted by the forces of growth till the roots were exposed above the ground, simply because the hard ground beneath offered no opportunity for root penetration.

There probably are a good many soils that will not be benefited much by blasting, particularly if the blasting is not immediately followed in the right way with heavy rooted cover crops. But these soils do not often occur in the fruit growing sections, for there are problems in moisture storage and in the making available of insoluble plant foods which the blasting helps to solve, and these problems are present in clay and loam and highland and lowland alike.

As for length and thickness and number of the twig growth of trees, I personally can bear witness to the fact that in blasted ground there is every reason to expect superiority. In only a half dozen instances out of a hundred that I have seen have the trees failed to make huskier, bigger tops in blasted ground. It is the rule rather than the exception to see whole blocks of 1000 or 10,000 trees so planted show an average growth of 18 or 20 or 24 inches in a season, and alongside of this I reflect that on similar soils I have seen many orchards planted with inferior tillage, that would average only seven, or eight or ten inches in twig growth in a season. It is only fair to say that I have seen a few orchards in light sandy soil and in very heavy soil, where blasting apparently did no good, or even did harm. The sandy soil seemed to lose in moisture holding capacity by the blasting. The clay seemed to hold water around the trees too long.

There may be some question about the value of blasting an open, fertile soil, but there can be no question at all when there is the least indication of plow sole or hardpan or a layer of clay. Blasting is intensive tillage. If you believe in tillage you automatically believe in the use of explosives to secure it, because there is no other method so effective and none that you can use to get the same results or to get results of a similar nature for so little money.

NITRATE OF SODA

Nitrate of soda is a valuable fertilizer in the garden in early spring. Especially is this true when the season is cold and backward as it has been this year. Gardeners who are desirous of giving their vegetables a good start and of bringing about early maturity, particularly with the leaf crops, will find a light application of nitrate of soda to be a stimulant. For the backyard gardener, a teaspoon dissolved in a gallon of water, applied to the soil along the row, is a good practice. It can be purchased from houses handling seeds or fertilizers.

SHORT COURSES

The University of California is mailing announcements of Farmers' Short Courses which are to be held at Davis September 24-November 2. There will be courses in dairy husbandry, butter making, cheese making, general agriculture, horticulture, in fact every feature of California's diverse agricultural practice .

APRICOTS-PRUNES

In the issue of May 12 on Page 549 we gave report from State Horticultural Commissioner Hecke as to conditions of fruits up to that date. There was an error in the third paragraph under the heading "Apricots", and a correction of this was sent from Sacramento but not soon enough to catch up with the misinformation. This paragraph refers to prunes and should have read:

"Santa Clara produces 55 per cent of California's prunes and reports a 100 per cent crop, while Sonoma produces 12 per cent of the total, reports a 60 per cent crop. Solano 75 per cent and Tulare 100 per cent."

SMALL FRUIT CULTURE

The gardener will find interest in Circular 164, "Small Fruit Culture in California" by A. H. Hendrickson, instructor in pomology, University of California. It takes up the matter of small fruits of all kinds under California conditions.

$1195 F. o. b. Racine
Mitchell Junior—a 40 h. p. Six
120-inch Wheelbase

Mitchell SIXES

$1460 F. o. b. Racine
7-Passenger—48 Horsepower
127-inch Wheelbase

Mr. Bate's Lifetime Car

Sturdy—Enduring—100% Over-Strength

The latest Mitchell is the 19th model built under Mr. Bate. It is the final result of 700 improvements.

It is the first car to announce our 100 per cent over-strength. Our former standard was 50 per cent over-strength. In the past three years, that standard has been doubled.

Over 440 parts are built of toughened steel. All safety parts are vastly over-size. All parts which get a major strain are built of Chrome-Vanadium. The gears are tested for 50,000 pounds per tooth. The springs we use—Bate cantilevers—have never yet been broken.

Several Mitchells have already run over 200,000 miles each. The Mitchell of today is built to be a lifetime car.

Costly Extras

This vast over-strength is a costly extra in these days of high-cost steel.

But the Mitchell, in addition, has 31 features which nearly all cars omit. Things like a power tire pump, ball-bearing steering gear, dashboard engine primer, etc.

And this year we have added 24 per cent to the cost of finish, upholstery and trimming. This makes the Mitchell the luxury car of its class.

All Are Free

These Mitchell extras, on this year's output, will cost us $4,000,000. But they cost you nothing, because we save this on our factory cost.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase and a highly-developed 48-horsepower motor.

Price $1195, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines with 120-inch wheelbase and a 40-horse-power motor—¼-inch smaller bore.

Price $1150, f. o. b. Racine

Also six styles of enclosed and convertible bodies. Also new Club Roadster.

John W. Bate built and equipped this mammoth plant to build this one type economically. He has spent millions of dollars and years of time to do that. His methods have cut our factory cost in two. And the savings pay for these extras.

All the added luxury on this year's models is paid for by savings in our new body plant.

See Our $1195 Six

Mitchell Junior—the smaller Mitchell Six—costs only $1195. Yet the wheelbase is 120 inches. You have never seen anything like this value in a car around this price.

See also the larger Mitchell. Note all its extra values. You will want all these extras, when you know them, in the car you buy to keep.

If you do not know our nearest dealer, ask us for his name.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

The Alfalfa Caterpillar

Noting the article in the issue of April 28 on the corn ear worm, with formula for killing the larva on the corn silk, are there not many other moths, the larva of which is just as destructive to other crops? For instance the little white, yellow, blue or pink butterflies sometimes come in swarms over entire alfalfa and corn fields. I have had a whole crop of alfalfa totally eaten by the larvae of these butterflies and have come to look with distrust on the whole family of butterflies. Have noticed also a great difference in the size, shape and color of the larvae.

For the corn ear worm you recommend the use of dry arsenate of lead, to be applied to the silk, which would of course succeed in killing only the larva. This may be all right, but it occurs to me that it might be possible to generate noxious gas or fumes which in settling on and through the crop, might succeed in destroying the moths before the eggs are deposited, or possibly the use of creosote, nicotine, carbolic acid or something of that nature might help materially. No doubt experiments have been made along this line and the results of same would no doubt be of interest to Cultivator readers.—Subscriber, Manteca.

The alfalfa caterpillar is entirely different from the worm which infests the ear of the corn. The parent of the caterpillar, as noted, is the bright yellow butterfly, while the corn ear worm is from the long grayish moth. Regarding the control of the alfalfa caterpillar Essig's "Injurious and Benecial Insects of California" says: "To successfully control such a pest one must resort to a number of practices, all of which judiciously combined will give very good results. The alfalfa should be cut, as soon as the larvae begin to apper in any numbers in the spring, to starve this first brood and thus keep down the next generation. Other cuttings should be made when blooming begins. Successive irrigations immediately after cutting to stimulate vigorous growth are very important. Disking the fields in the fall of the year will kill many of the over-wintering pupae. The food plants should not be allowed to grow wild around the fields, as they serve for excellent breeding places. Pasturing the land also helps to keep down the pest."

By the way this excellent book, if not out of print, may be secured by writing to State Horticultural Commission George H. Hecke, Sacramento. This book should be in the library of every California farmer.

Keeping Worms Out of Potatoes

Is there any method of keeping worms from potatoes after they are dug from the ground? Would like to keep some for home use, but the worm always take possession of them as soon as they are put away.—Subscriber, Long Beach.

The potatoes should be left exposed as short a time as possible. They should be stacked and stored where the moths cannot get to them to deposit eggs. Of course there may be some infested potatoes which have grown near the surface and on which the eggs were deposited before digging, but the infestation is greatly lessened if this care in digging and sacking is observed. The infestatic may be still further lessened by e posing in air tight bin to the fume of carbon bisulphide, which is use at the rate of one pint to 1000 cub feet.

Rabbit Trouble

Please advise what is wrong wit little rabbits when the eyelids stic together; also why should health looking young rabbits die off when a parently they are not sick? Am fee ing ground Egyptian corn and var ous green feeds, no cabbage or le tuce, however, and none of the rabbi have the slobbers. — Subscribe Bakersfield.

This question was referred to C. Gilmore, Western Secretary Nation Rabbit and Pet Stock Associatio who writes:

"Eyelids sticking together caused from slight cold. Bathe the twice daily in a solution of one pa boracic acid and ten parts war water. Reason for apparently health young rabbits dying is probably ove feeding of greens or feeding too we allowing to remain in the hutch an become soured, feeding irregularly o occasionally. Would suggest that yo feed rolled oats or barley in prefe ence to kafir corn, or, better still, good rabbit mash."

Heap big mileage!

Mileage Makers

Every Savage mileage maker gets full credit for good work because all work is "keyed" to the serial numbers on the tires. We know in every case just who is responsible for "Heap big mileage."

This plan creates a strong sense of personal responsibility and pride among our workmen, and there is keenest rivalry to see who can produce most mileage per tire.

You can help us to produce even greater mileage for you if you will send us full details of all Savages that run over 7000 miles.

Please be sure to give Serial Number, size of tire, date of purchase, name of dealer, and actual number of miles run.

To help show our appreciation for this co-operation, we will send an inner tube patch free of charge to all who report, "Heap Big Mileage."

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answe legal queries in this department.

Immediate mail replies cannot b given except where fee to Mr. Stanto is paid. When replies are wished b Cultivator address query to 116½ N Broadway, Los Angeles.

Unsigned communications receive n attention.

Taxes on Homestead

Can a homestead be assessed an taxed after having made final proo and before receiving patent? Is i legal to assess 80 acres of land th same as 160 acres, other things bein equal?—Subscriber, Victorville.

When a homestead settler has com pleted his prescribed term of resi dence and is entitled to a patent hi interest in the land is taxable, as i such cases the United States holds merely the dry legal title and has n real ownership therein. The only rem edy for an alleged over-assessment i to make application to the board o supervisors sitting as a board o equalization; this application must be on file before the first Monday in July.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Hard Milker

I have a young cow with her first calf that is very hard to milk; aside from that she is an ideal cow. Is there any remedy for it?—Subscriber, Ontario.

The openings in the teats can be enlarged by cutting or stretching the sphincter muscle that surrounds the opening. In cutting great care must be exercised as one is liable to cut too much and do more harm than good. It is better to stretch the openings by inserting an instrument that is made for that purpose. There are several different kinds that can be purchased from veterinary instrument manufacturers. Some are of the form of a small collar button. These can be inserted after milking and left until the next milking. The instruments are of different sizes, and by using the small ones at first and

changing to the larger ones you will soon get the desired results. The instruments should be thoroughly cleaned every time before inserting them to avoid introducing any dirt that will irritate the parts and cause inflammation.

Founder

I have a mare that is stiff in the front legs. Working her on the land she seems all right but on the road she is stiff next day and it is hard for her to turn out of the stall. The stiffness lasts for several days after a 30-mile drive, but not so long after shorter trips. There are puffy swellings on the front legs at the fetlocks which increase after a long drive but go down again after a rest. The hoofs are hot to the hand and do not look right. I think it is called "contracted" About a year ago while driving her with another horse she slipped and stumbled, which I thought was due to the other horse biting her and annoying her. On the advice of a friend I blistered her once and it did good for a time. What would you advise doing for her?—"No Horseman".

The soreness is all in the feet. At some time she was overheated and given too much water or allowed to stand in the wind and cool off too quickly. Or she may have been overfed and had a case of indigestion. Such treatment is often followed by laminitis (inflammation of the lamina of the feet) but why nobody knows. This inflammation is likely to become chronic and interfere with the growth of the hoofs which become contracted and squeeze the inner parts of the foot and cause pain. Probably the first of her trouble was about the time you took the long drive. That was the cause of the stumbling. The remedy is to remove the shoes and pare the soles of the feet thin and allow her to run barefooted and if possible to run in a wet pasture. Also blister just above the hoofs every two or three weeks until several blisters have been applied. A good blistering ointment can be made by using one part of cantharides, one part of biniodide of mercury and six parts of lard. Mix thoroughly and rub a little into the skin. Rub it in well and tie the horse so she can not reach the blister with the nose for 24 hours, then rub on some lard and turn her out. By following this treatment, in time the feet will grow out larger and the soreness will be much relieved, but a permanent cure is not known for such cases. By allowing the horse to go barefooted she will last a long time on the farm but can never stand much road work. If there was anything serious with the puffs at the ankles they would cause lameness when working on the land, but as the lameness only follows the pounding of the feet on the hard road it is evident that the trouble is all in the feet.

DISPERSAL OF WILLOWWOOD JERSEYS

Written for California Cultivator

THE dispersal sale of C. G. McFarland's Willowwood herd of registered Jerseys at Tulare on May 17, established a new high-price average for Jerseys in California, and many of the great animals in the herd sold far below their real value at that.

Buyers were present from widely separated points as thorough publicity had been given the sale by the management. Many of the established breeders of the state turned out, but it is noteworthy that practically the entire herd was sold to breeders just founding herds.

Grant A. Brown of El Monte was the heaviest buyer and took a great herd of 13 head to Southern California with him. A. L. McCulloch of Alpaugh bought a foundation herd that has every qualification to make good in his bands. Ed Whaley of Tulare bought five of the best things in the sale, including the $400 two-year-old heifer, Pearl of Willowwood 2nd, that topped the sale. Mark L. Requa purchased three topnotch females for his Anchorage Farm at Orland.

Twenty cows averaged $245. Twenty-one heifers and heifer calves averaged $189, making a grand average of $216 for females in the sale. The sale was capably managed by California Breeders' Sales and Pedigree Company, with Col. Ben A. Rhoades as auctioneer. The sale totalled $10,075, a large number of young bulls swelling the total.

Following is list of females sold with price and name of buyer:

Rioter's Miss Gertrude, $370; Philadelphia's Glory Jennie, $135; Lottie's Glory Bird, $235; Loretta of Willowwood, $145; Bonnie of Willowwood, $190; Philadelphia's Glory Zella, $160; to Chambers and Wilbur Inc.

Lottie of Willowwood, $385; Jennie of Willowwood, $190; Rioter's Golden Gladys, $300; Dot of Willowwood, $300; Dot of Willowwood 2nd, $200; Gene of Willowwood, $190; Elodine of Willowwood, $300; Fawn of Willowwood, $180; Neoma of Willowwood, $175; Brown Irmalia, $220; Irmalia of Willowwood, $175; Daisy Witch, $135; Gertie of Willowwood, $180; to Grant A. Brown.

Lottie of Willowwood 2nd (calf), $90; Pearl of Willowwood 2nd, $400; Zella of Willowwood, $240; Rioter's Glory Gretchen, $300; to Ed Whaley.

Pearl of Willowwood, $310; Rioter's Miss Lady, $315; Moravia's Fawn, $290; to Mark L. Requa.

Kate of Willowwood (calf), $105; Dot of Willowwood 3rd (calf), $115; to P. Staufer.

Mattie of Willowwood, $300; to W. H. Wilbur.

Meridale Melia Kissam, $230; Gem of Willowwood, $110; Lulie's Coomassie, $200; Blue Stocking Ona, $240; Eurotas Pogis Fawn 4th, $365; Marigold of Willowwood, $190; Emma of Bellview, $120; to A. L. McCulloch.

Lulie of Willowwood, $135; Gertie's Son Royal Fawn, $230; Evelyn of Willowwood, $205; to S. C. Harshbarger.

Ona of Willowwood, $145; to O. G. Gismegian.

1916 YEAR BOOK

The Year Book of the United States department of agriculture for 1916 is just from the press. Readers of the Cultivator may secure this book by writing to California senators or to the representatives of the district in which the applicant lives.

This is one of the most completely illustrated numbers ever issued by the department, is rather larger than for the preceding two or three years and has a fund of information invaluable to California farmers. It contains the annual report of the secretary, description of the meat inspection service of the department, also of some other activities of department work and discussions as to color as an indication of the picking maturity of fruits by Corbett, farms, forests and erosion by Dana, introduction gardens of the United States Department of Agriculture by Dorsett, the dasheen, its use and culture, by Young, supression of brown-tail and other moths, by Burgess, handling the wool clip by Marshall, business essentials for cooperative fruit and vegetable canners by W. G. Kerr, practical use of insect enemies of injurious insects, Howard, development of our own resources of potash by Brown, and farm tenantry, sewage disposal, rodent pests, Thanksgiving turkey, mutual fire insurance and innumerable other questions.

The WHY of HARDMAN Sure Grip TIRES

Smooth Riding and Effective Non-Skid.

When You Buy Tires You Want to Know Three Things

How is the tire made
How far will it go
The Price ?

Well—

No tire is more scientifically nor more carefully constructed than the HARDMAN. Those peculiar looking rectangles cut out or molded out of the surface produce perfect vacuums under the weight of the car and at the same time the walls form complete bases of contact protecting the carcass and assuring long wear.

The application of an extra heavy PURE PARA CUSHION, together with the PLIABLE THREAD, STANDARD SEA ISLAND FABRIC and THICK GAUGE, ALL PARA FRICTION, render Hardman Tires much less liable to stone bruise.

Hardman tires are now sold under our regular warranty adjustment made on a basis of 5000 MILES. The price is equal to the lowest for the service rendered.—Two grades,

Hardman Sure Grip and
Hardman Junior.

Send for descriptive price list and state what car you have.

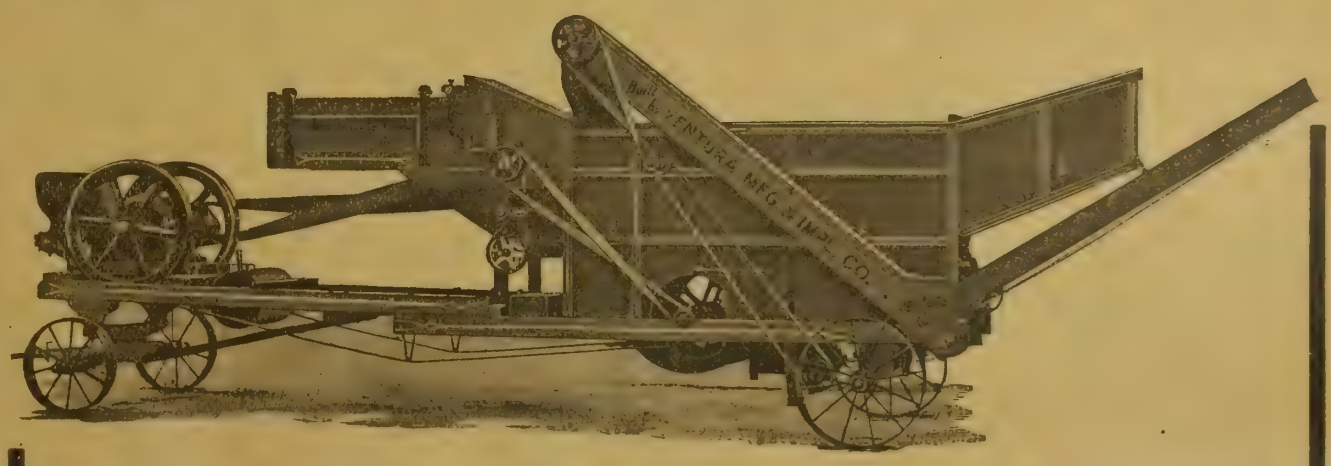
When writing advertisers, mention The Cultivator.

Every Bean Farmer is Interested in this



There was a time when the bean growers of California tramped out their valuable bean crop on a threshing floor. Through years of patient toiling and the application of scientific principles William Hamilton, mechanic and inventor, patented and manufactured the Ventura Bean Thresher. The production of this machine has been to the bean industry what the reaper was to wheat. For twenty-one years our threshers have given universally satisfactory service. Beginning with one machine we now offer six sizes.

The Ventura Bean Thresher Junior No. 2

is now offered for the farmer who desires to do his own work in his own time. The Junior No. 2 also is large enough for a neighborhood thresher to supply the needs of several farmers with relatively small bean acreage who may be unable to wait for service from the big machines. The Junior No. 2 is the best machine in the various types now on the market. It has its own power (also without power), is substantially built, and has all the successful construction that has made our larger machines supreme in the bean threshing line. The price is within the reach of all bean farmers. It can be operated with a minimum of ten men and possessing a thresher like this you can thresh when the best opportunity is offered. Capacity 150 to 300 sacks per day. You cannot afford to take chances on bean crop losses when prices are so good when you can save your crop with a machine like this. There is a greatly increased bean acreage this year and a shortage of materials. Orders will be filled in the order received. Place your order early or you will be disappointed.

Ask your nearest dealer or write to us about it now. Free catalogue on request. We manufacture a full line of bean and beet tools.

THE VENTURA IMPLEMENT AND MANUFACTURING COMPANY - Ventura, California

Samson Sieve-Grip Model S-25

READY?

Are you ready to get the best out of your farm this year?
Have you ample power for this season's work?
Do you want to get along with fewer horses and men?

SAMSON SIEVE-GRIP

Reg. and Pat. U. S. and Foreign Countries

tractors are built to help you do these things. Sturdy, simple, powerful, they can cut your farm power costs remarkably. Every farm where a Samson Sieve-Grip is working is being bettered, is producing bigger net profits.

Let us tell you more of Samson Sieve-Grips and the name of the nearest dealer. Two sizes—Models S-25 and R-12.

LOS ANGELES VISALIA

All Kinds of Irrigation Appliances

In these days of high prices and shortage of all manufacturing materials, it gives us pleasure to announce that we have a full supply of Irrigation Appliances on hand at convenient distributing points all over the Pacific States, and are prepared to make prompt deliveries throughout the season.

We are the pioneers in this business, and the largest manufacturers of Irrigation Appliances in the world. Years of experience have taught us how to make the best possible goods at a fair price.

Write today for booklet on "Irrigation"—or for any specific information you may require.

1226 East 28th Street Los Angeles, Cal.

Corn a Profitable Crop

CONTINUING discussion of corn and its production in California speakers at the convention at the Sperry Mills in Stockton have given a fund of information which we are glad to print for the benefit of our readers. We believe California's capabilities as a corn producer are not fully appreciated. On the other hand we know that for years corn culture has been tried and many have been discouraged with lack of success. But some are succeeding in growing this crop and securing good cash from the corn. With modern methods of shredding a good coarse fodder is easily converted into a high grade product. Besides the addresses given by Messrs. Luke and Westgate in a former Cultivator we quote from discussion by Mr. Bigger.

J. M. Bigger

Thorough cultivation—that is the keynote to success in growing corn as well as in all other branches of agriculture, and in the planting of your corn another thing I would like to emphasize is not to plant too much seed. If you have your corn planted too thick it will not yield well, and the husks will be poor in size. That is one of the faults I find with my tenants, they think that by getting a certain amount by planting three pounds, they can get a third more by planting four pounds.

• • •

The questions which follow were put by members of the audience:

How about suckering?

I have not found it practical, especially in the King Phillip variety, which is the worst variety for suckering, but it will stand more thinning than any other variety. We have had as good results by not suckering but planting thinner.

How about irrigating?

It is a great mistake to over-irrigate corn. Cultivation will retain the moisture. Corn does not require as much water as beans.

How many times, and at what times do you irrigate?

As soon as we notice that the moisture is leaving the ground, and when the color is not quite right on the growing corn.

How quick should the water go on after you notice the color?

Right away—as soon as the corn begins to turn it shows that it needs a little more moisture. If your land is a little too wet the corn will be too light a green. What is true of corn is true of all other plants. They all indicate a want of moisture by the color of their foliage.

I want to caution you against too deep cultivation. After the corn is well along you have to take care of those small lateral roots, being careful not to cut these off by deep cultivation.

How about the distance of planting?

The rows should not be closer than 42 inches, and not over three plants to a hill. We don't believe in hilling corn very much in California.

On your land what is the water depth?

While I have said that corn does not require as much water as beans, it will stand more abusage from water than most other crops.

Will corn grow on land where the water is two or three feet from the surface, or will corn do better when the water is farther from the surface?

My experience in the Delta section has been that I could grow corn on subirrigated land not adapted to growing potatoes, beans or other vegetables, and required very little irrigating.

I have been in the business 30 years and have seen a good many failures by my neighbors in planting too late, in selection, cultivation, difficulties in harvesting, and sometimes the blackbirds harvesting for them.

In California we are troubled with a worm cutting down the blossom end of the corn, and the hard Flint varieties on that account have been found to be the safest. The King Phillip has done well in the Delta and brought a good yield, less than 400 acres yielding a crop worth $30,000.

Do you know anything about the lister?

Yes. We have not had as good results with the lister as with other planters, although in a dry country the lister would be especially good, but on the wet low lands it is better to plant near the surface, and like all other plants if conditions are ripe it will germinate quickly and come up, producing better results.

How early do you plant?

The first of April if the winter is short and the nights are not too cold and frosty, or your corn should be in about the middle of April, not later than May. Corn will stand one cutting down by frost and will come up without replanting. Corn is not a crop that will do to plant too late. California has not an ideal climate for growing corn. We have too many cold nights which are not good for the corn grower.

How late in May can you plant?

I have had corn planted the middle of June produce a good yield. Corn is not hard on land and is a good crop to alternate with. We had our best stand of barley this year from land that had grown corn. This is one of the best advantages in raising corn; you can alternate it with other crops.

How late did you say?

The middle of June. I have seen it mature when planted the middle of June, but as a rule you must plant the seed by May, and if cold weather should come, you can, of course, replant. Ten pounds of seed is about the most you can use and the cost of the seed isn't much.

Do you test your seed?

No. We have never tested it. I don't know whether or not I have touched upon the selection of seed, but the careful selection of seed by the Eastern farmer has brought up the yield in the United States from 17 bushels to 37 bushels. We have always selected our seed from the crib.

Will corn tolerate much alkali?

Corn will tolerate more alkali than either potatoes or beans. It will stand considerable alkali if you can get it to germinate; that is one of the advantages in growing corn. You have to be more careful about irrigating on alkali land. You must have irrigation where you have alkali, and drainage. You can grow corn on land that has considerable alkali.

Which seed do you think would be the better, seed grown here or in the East? Would selected seed from Iowa have to become acclimated?

It took seed purchased from the Funk Seed Company of Iowa a year or two to become acclimated, and then it did not do as well as the King Phillip variety, but if people are going to continue in the business it would be well to get seed from the East and get it acclimated. They are more careful in the selection of seed.

Is this King Phillip a native of California?

I first got the seed in the southern part of the state. They had been growing it in Orange County on similar land, and that is how I came to select that variety to start in with. It is good for ensilage.

One quesion more. In harvesting, have you had any experience in cutting the stalks early and putting them in shock to dry out?

I have had some experience. It is an open question as to cutting it and shocking it compared with other methods of harvesting, but the advantages are in the fodder; you can get it off two weeks earlier. Our way has been to put a crew in and husk it and have it shocked and thrown into piles, harvested and put in the cribs. We sell to the sheep men at $1.50 an acre, and we never have had any trouble in getting rid of the stalks. We plow them under, or sometimes if too thick, burn them.

Have you had any experience in gathering the corn in that way, by cutting and shocking it up, then husking and shredding it?

Have had some experience but not in a large way. When I cut it and put it in shock, I first put it up that way, then I would husk it and feed the shuck to the cattle as I required it, but my experience in this line is not up to date.

It is noticeable, isn't it, that the really important people do not insist on having the most important places given them.

The Box-Tree

Written for California Cultivator by E. Braunton

IN Isaiah 41:19 it states: "I will set in the desert the fir-tree, and the pine, and the box-tree together." This, and 60:13 are the only places in the Bible where the box-tree is mentioned. It is native to Europe, Asia and Africa. This is Buxus sempervirens, though another species, B. longifolia is now more common in Palestine. Like the myrtle, the box makes an excellent hedge but is much slower in growth. Not all species of box do well in California, and the dwarf variety of B. sempervirens gets its foliage scorched by the fierce summer sun, but among the dozen or more varieties of this species there are some that do not suffer from the exactions of a semi-arid clime. One plant native to this state has been called Buxus Californica but is a Simmondsia and bears a seed pod very closely resembling an acorn with its cap. It is a showy shrub and well worthy of cultivation as a local member of the box family.

The Lily of the Bible

The lily is many times mentioned in the Bible, and because we consider the lily emblematic of purity and therefore white in color, we have come to think only of white lilies as we read Scripture. But there are no white lilies native to Palestine and I can find no intimation in the Bible that the lily is white or was at that time considered emblematic of purity. That the lily was one of showy color is certain, for it is stated that: "Solomon in all his glory was not arrayed as one of these," and again in Song of Solomon, 5:13 it states: "His lips are like lilies," wherefore they should be red. It is said Lilium Chalcedonicum grows abundantly in Palestine though Bailey's Cyclopedia gives only Greece and the Ionian Isles as its native habitat. This lily is a brilliant scarlet and is known as the scarlet Turkscap lily and is no doubt the lily spoken of in the Bible generally.

Palestine Oaks

Many persons who for sentimental reasons would like to grow plants native to the Holy Land will be pleased to know that three species of oaks grow there as native species. One of these is a live oak or evergreen species, though but a large shrub. It is known as Quercus pseudococcifera, the "prickly oak." Another species is Q. aegilops, the Valonia oak, and bears a really gigantic acorn. The third species is Q. infectoria and is rather rare in Palestine. So far as I know Q. aegilops is the only one of these species offered for sale in California, being offered by a Fresno firm. Whether or not it has yet borne acorns in California I cannot state.

The Camphire or Henna

The camphire mentioned in the Bible is held by some to be camphor, but as the latter does not grow in Palestine or nearer to that country than China or Japan, another plant must have been meant. Nearly all authorities agree the plant is Lawsonia inermis, a shrub sometimes grown in California. It is found in but one place in Palestine, and that is Engedi by the Dead Sea. In Song of Solomon 1:14 it states: "My beloved is unto me as a cluster of camphire in the vineyards of Engedi." It is a handsome shrub with fragrant flowers which grow in clusters. In the Far East it furnishes a yellow dye which is used in Egypt by the women to color their nails and by the men to dye their beards.

The Common Myrtle

Myrtus communis, often called English myrtle, is native to many countries and is not particularly English. It grows as far away from that country as the Holy Land and is many times mentioned in Scripture. It thrives splendidly in California and is a general favorite for it has numerous attractions. Both foliage and flowers are bright and shining and both have a delightful fragrance. Very old specimens grow to be a dozen feet high but ordinarily they are found not more than one-half that height. As a hedge they are scarcely surpassed by any plant locally used for that purpose.

The Clackamas County, Oregon, Fair will be held September 19-21.

CALIFORNIA, A SEED GROWER'S EDEN

From the standpoint of the seed-grower, California is a veritable Garden of Eden. For untold centuries the elements have washed down from its mountain sides the soil that now fills the valleys with unmeasured fertility. For six months of the year, Nature accommodates the grower with cloudless skies. Rain at seed-harvest time is a rare occurrence in California; hence the seeds grown there are bright, plump, full of vigor and vitality. To carrots, lettuce, onions, and radishes, Californian soils and climate present ideal chances for perfect development such as probably no other part of the world can claim. As a result, crops of 600 tons of carrot seed, 500 tons of lettuce seed, 600 tons of onion seed, and 400 or 500 tons of radish seed are an annual occurrence in the Golden State—almost inconceivable quantities from the standpoint of the home gardener who is accustomed to handle these seeds in "packets" containing a fraction of an ounce.—Adolph Kruhm, in The World's Work.

England has suspended prohibition on importation of farm tractors.

Book Review

STRAWBERRY GROWING

"Strawberry Growing," by S. W. Fletcher, professor of horticulture, Pennsylvania State College, published by the Macmillan Company, New York, at $1.75.

This is a 326-page, well bound, fully illustrated treatise on the strawberry. Its preface says:

"The strawberry is distinctively North American. Most modern varieties sprang from species found only in the Americas. Progress in the domestication of this fruit was coincident with the introduction into Europe of American types. The acreage under commercial culture in the United States and Canada has grown from 1400 acres in 1854 to 150,000 acres in 1910. This is more than the combined acreage of all other countries. This book aims to reflect modern commercial practice in North America."

There are 15 chapters and an appendix touching upon locations and soils, planting methods, rotation, manure and fertilizing, tillage and irrigation, training the plants, mulching, pollination, packages, picking and packing, marketing, cost of production, propagation, varieties, frost, diseases and pests. The appendix contains a fund of information as to acreage and production.

"The Car of No Regrets"

KING EIGHT
60 HORSE POWER

You "make hay" when you buy a King

IT is an automobile sufficiently reliable under severe official road tests to have its chassis adopted by the United States Government for armored cars, though it shares this honor with several other good makes of cars, some of higher price.

Its four bodies were designed for unusual grace of line and elegance of finish, and one of them may appeal to you as being more beautiful than any other car among the many attractive models now on the market.

The King is build by a long-established company with a reputation for good cars and fair dealing, ranking high among a number of worthy competitors.

It is a car which may be conservatively described as economical, considering its high power and bigness, and one that "handles" easily,—its all-round road competence, especially on hills, has surprised and delighted many.

In all, we believe the King Eight does offer a quite remarkable combination of power, economy, reliability, comfort and style, which, considered with the price, makes it a purchase absolutely safe for anybody and one thoroughly consistent with our slogan "The Car of No Regrets."

Foursome (shown above), $1700; 7-passenger Touring model, $1650; Sedan, $2300; Roadster, $1585. Prices F. O. B. Detroit and subject to increase at any time. A catalog in color will be sent on request together with the name of a near-by King dealer.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

If more intensive cultivation means patriotism we have a patriotic cover illustration this week. Even among trees which have almost arrived at maturity other crops may be grown. It is not yet too late for beans, potatoes and many other valuable food crops. And don't forget the live stock; there is great need of feed for them all.

RIVERSIDE CONVENTION

State Commissioner Hecke has announced that the State Fruit Growers' Convention at Riverside has been postponed until 1918, this because of activities of all the workers in the "patriotic-produce-more" campaign.

That convention would have been an opportunity for giving a greater impetus to the campaign, but perhaps this is a case of work not impetus, or as one has expressed it "more perspiration and less inspiration."

DECORATION DAY

Next Wednesday is Decoration Day, or the day we observe in memory of the veterans of the Civil War and of all who have served their country.

To a degree it has become a day of games and sports. We believe, however, it would be far more fitting if it could be made a day when patriotism should predominate, and certainly this is a year when the nation might well think most seriously on the great problems which are before us, as well as honor the memory of those who have solved some other great problems of our nation. Honor the Blue and the Gray and the boys who gave up their lives that Cuba might have freedom.

THE LIBERTY LOAN

On this page is given form of application for bond of the liberty loan, with explanation of what a liberty loan is and other valuable information regarding this, the greatest of all bond issues.

It appears this early that this issue will be greatly over-subscribed, and the treasury department has been assured that the entire issue will be taken at once if so wished by the department. But to make it true to name it has been offered to the people of the United States at par and accrued interest. Banking houses and many other institutions, especially newspapers, are receiving applications for these bonds and transmitting them direct to the federal reserve bank without any charge. Newspapers are freely advertising them. Every penny subscribed goes directly into the liberty fund which in the belief of the American people will carry American freedom to other countries as well as preserve it for our own.

Sign blank on this page and send to the office of the California Cultivator which will be glad to transmit to the reserve bank. Two per cent of the amount of bond to be purchased must accompany application. Send money in draft or money order payable to Federal Reserve Bank.

MORE LABORERS

Will the United States open the Golden Gate to a half million Chinese laborers? We think not, for international complications would doubtless result which would be most embarrassing at this time. There certainly is a shortage of competent labor, but we believe it will be greatly relieved by the use of the forces which are at command in this country. It now appears that the draft will not be effective until September, permitting most of this season's work to be completed. Further, the appeal to the patriotism of thousands of others who might not ordinarily enter into productive work will result in securing many thousands of competent laborers. For example, the high schools and colleges should release during the summer months a large force which will be very efficient after a little training. If as much patience is exercised in the training of this force as would be required in the training of a half million Chinese coolies an efficiency would be given to American productive agencies which has never been realized. Again, may not our employing producers give better housing facilities and increase the good will of the present working force?

Let us make American farming a white man's work.

MAXIMUM AND MINIMUM

Many producers have questioned as to what may be the action of the government regarding maximum prices on food products. We believe this question has been raised so often that it has to a degree affected the amount which will be produced this season.

Replying to a question along this line Secretary Huston has said: "Your inquirer seems to think that it is contemplated to fix a price to producers which would be so low that they could not secure a reasonable return. Of course there has been much confused writing in the papers. Only two suggestions have been made: One is that the government be given power to fix a minimum price with a view to stimulate production. This price would be sufficiently high to insure producers against loss. It could not have the effect feared by your correspondent, because the very object would be to stimulate production by assuring sufficiently high prices to producers. The other suggestion is that the government be given power to fix a maximum price in extreme emergencies to break corners or to control extortion. It is not contemplated that the government, if it had the power to fix a maximum price, would announce the existence of such a price in reference to any one or more commodities in advance of the appearance of an acute situation; nor is it contemplated that such a price, if fixed, would be of continuing operation. The single thought in this connection is that the power might be used as a club, to be applied only in individual cases where it is clear that an individual or corporation had established a corner or was practicing extortion. The power, it is suggested, would be used against such individuals or corporations, and when that particular situation was controlled or the abuse eliminated, the incident would be closed. Any further exercise of the power would depend upon the appearance of a similar condition."

BUY A LIBERTY LOAN BOND

Written for California Cultivator By Herbert Quick

MONEY used to save liberty to the world becomes sacred. The Liberty Loan is money devoted to that great cause. Constitutional liberty was born in England, and was transplanted in America by our forefathers. Our history and England's are the same down to 140 years ago.

A hundred and forty years ago through France's aid we formed our own separate government for the administration of our share of this liberty. Since that time we have been engaged in the great task of developing it, and to the best of our imperfect ability perfecting it. It is a long look from Magna Charta to the constitutional conventions of Illinois, Massachusetts and North Dakota, to the initiative, referendum and recall in California, but the latter rest on the former. So the Ship-Money struggles of the British kings and the new tariff board in Washington seem remote from each other, but the one is descended as directly from the other as are the laws of Kansas from the British constitution.

War is not our business. We hate it. So does France. So does England. "The irony of it," said many a French soldier as he marched to the front; "that we, with all our culture and learning and civilization must go into the trenches and fight like savages!" And how they have fought! The British people for months could scarcely believe that they must go down to this foul death; and how they went, and how they are fighting! War is not their business either.

The Liberty Loan will save France, redeem Belgium, preserve Britain, safeguard ourselves. For we must carry the war to the Germans, or they will bring it to us. If we cannot win with the most powerful allies in the world, we shall be forced to fight it out alone with Germany and such allies as she may bring against us. It is not an incident of this war only that Germany sought to combine Mexico and Japan against us. It is a part of her policy. It is connected with the German uprising in Brazil.

Fifty thousand Robert Morrises are enlisted in a great army in the subscribers to the Liberty Loan.

In the Liberty Loan we send our money to keep in the field the men who will make it possible for our men to successfully bear the flag in Europe. For that flag to take its place among the banners displayed in the tortured line from the Swiss frontier to Antwerp in a terrible and wonderful thing. We all hoped that Columbia might always live her old retired provincial life without mingling in the society of the world's courts and chancelleries; but it was not so to be. Willing or unwilling she must make her debut—and she must make it in blood and smoke and thunder.

In the Liberty Loan the wealth of America salutes the flag. It speeds on before our soldiers, and tells our friends fighting and dying for our cause that the flag will soon be with them, and to be of good cheer. It tells the dazed people of Russia that the greatest of the republics is in the field for her new born rival in greatness. It tells Russia to look for the flag and collect her wandering thoughts and arouse her resistless might. Without the Liberty Loan Columbia can never take her place in that mighty company without disgrace With it the flag will make good our boast:

Flag of the free heart's hope and home!
By angel hands to valor given;
Thy stars have lit the welkin dome,
And all thy hues were born in heaven.
Forever float that standard sheet!
Where breathes the foe but falls before us,
With Freedom's soil beneath our feet,
And Freedom's banner streaming o'er us!

Information Regarding Liberty Loan Bonds

What Is the Liberty Loan Bond?

A Liberty Loan Bond is a solemn promise of the United States to pay at maturity the amount of the bond to the holder thereof, and to pay interest semi-annually each year from the date of the issuance of the bond until it is fully and finally paid.

The bonds will bear interest at 3½ per cent, payable semi-annually June 15 and December 15, and run 30 years, except that the government reserves the right to pay 15 years after date. They may be paid for, two per cent of the amount desired to accompany the application, the balance on June 28 or, if preferred, one may send two per cent with application, 18 per cent on June 28, 20 per cent on July 30, 30 per cent on August 15, 30 per cent on August 30.

What Is the Nature of a Liberty Loan Bond?

There are two kinds of Liberty Loan Bonds. Bearer Bonds are to be issued in denominations of $50, $100, $500 and $1000. These Bearer Bonds, which are made payable to bearer, have interest coupons attached which are detached by the holder when the interest installments they represent are due, and can be cashed at any bank the same as a United States Treasury note.

Registered bonds are to be issued, which are registered as to both principal and interest, in denominations of $100, $500, $1000, $5000, $10,000, $50,000 and $100,000; checks for the amount of interest due will be mailed out semi-annually to the holders of these registered bonds.

These bonds are non-taxable and contain the provisions that the holder may exchange them for other bonds, dollar for dollar, which the government may possibly find it necessary to issue, bearing a higher rate of interest. The bonds are issued in small denominations that every American citizen may have opportunity to purchase.

APPLICATION FOR BONDS

This application should be transmitted through the Cultivator Publishing Co., 115½ North Broadway, Los Angeles, or the subscriber's bank, trust company, or other agency acting on his behalf, or it may be filed direct with the Federal Reserve Bank, San Francisco, or the Treasury Department at Washington.

Dated.....

To the Secretary of the Treasury:

According to the terms of Treasury Department Circular No. 78, dated May 14, 1917, the undersigned hereby apply for $.....par value of the 15-30 Year 3½ Per Cent Gold Bonds of the United States, and agree to pay par and accrued interest for any bonds alloted on this application. The sum of $.....is inclosed, being 2 per cent on the amount of bonds applied for (or payment in full for the one $50 or the one $100 bond applied for).

Agricultural News Notes of the Pacific Coast

Northern California

Beekeepers of Yolo County have formed an association.

The Vacaville Reporter records sales of prunes on a 7½ cent base.

Cherry shipments are beginning to go forward steadily from Vacaville.

Del Paso Heights, Sacramento County, is organizing a farm bureau center.

A movement is on in Butte County to secure the appointment of a farm adviser.

Los Molinos, Tehama County, last week shipped out several carloads of first cutting alfalfa.

Plantings of Tepary and Pink beans are being made in the Fruit Ridge district of Eldorado County.

The Glenn County farm bureau will hold farm center meetings at Elk Creek May 21, 22, Plaza 24, 25.

Various uses are being suggested for rice straw from winter feed for cattle to manufacture of brooms.

W. E. Scearce of Orland made a sale last week of $30,000 worth of ewes and lambs to a Nevada firm.

Mt. George is holding its monthly farm bureau meeting today at the Coombs Ranch. There will be a picnic lunch.

The Sperry Flour Company is considering the establishment of a depot at Vacaville for the upper end of Solano County.

The Yolo Independent suggests that a good way to go after the food shortage would be to lift the embargo on the killing of wild geese.

The first shipment of cherries sold in Philadelphia this season came from Vacaville. It was a half box of Purple Guignes and sold for $25.

A mass meeting of citizens of Eldorado County was recently held to consider advisability of establishing an agricultural course in the county high school.

State Veterinarian Charles Keane announces that every precaution will be taken to control an outbreak of hog cholera in the Ione district of Amador County.

In the change of the boundaries of the Sacramento and San Joaquin drainage district all of Glenn County and practically all of Butte has been cut out of the district.

President Stephens of the Pacific Rice Growers' Association denounces tactics employed by some millers who, he says, are attempting to corner the crops of the growers for the sake of holding up prices.

At a recent meeting of the state defense council at Woodland, Yolo county, it was estimated the county would require 10,000 more laborers than in normal years to handle the immense crops being planted.

Central California

The Valencia crop of the Porterville district is reported unusually large.

The Terra Bella district of Tulare County is acquiring many new orchard tractors.

Fresno County dairymen have decided to take a census of all the cows in the county.

The state convention of county horticultural commissioners will be held in Modesto June 6-7.

The Terra Bella Fruit Growers' Association has leased the cannery building for next year.

The California Grape Protective Association has called a mass meeting in San Francisco May 26.

Irrigation bonds of the Terra Bella district have been validated by the state bonding commission.

Orange growers of Lindsay have decided not to begin shipping of Valencias until the first of June.

Contracts have been let for packing houses for the Peach Growers' Association at Hanford and Reedley.

The chamber of commerce of Fresno County has begun the taking of a food and labor survey of the county.

The first full carload of olives packed by the Lindsay Ripe Olive Company was shipped to New York May 15.

Many farmers of Tipton, Terra Bella and Woodlake, Tulare County, have signed contracts with canners to grow tomatoes.

Milk producers of Fresno County held a meeting at Fresno yesterday to plan organization to take care of the marketing problem.

An effort is being made in the Turlock district to encourage the planting of Spanish peanuts and the establishment of an oil and meal cake mill at Turlock.

The California Associated Raisin Company and the California Peach Growers have increased wages in their packing plants two and a half cents an hour.

The picking of Valencias will probably begin June 10 in the Lindsay district but packers are trying to induce growers to leave fruit on the trees until thoroughly ripened.

J. W. Jeffrey of the Dinuba viticultural experiment station announces a meeting of grape growers and shippers at Fresno on June 2. This meeting is under the auspices of the state viticultural commission.

Demand for California peaches has been so great that the California Peach Growers' announces withdrawal of choice peaches from the market; stating that less than 3000 tons remain of standard Muirs and Extra and Fancy Yellows.

Southern California

Riverside County will hold its fair October 9-13.

First apricots were shipped from Indio on May 7.

The Hemet Valley expects to market 5000 tons of apricots.

Mowers are at work on first cutting of alfalfa in the Perris section.

Pomona reports a very heavy crop of apricots, demanding thinning.

Redlands has shipped out this season 3575 carloads of citrus fruit.

Riverside County begins its farm bureau work with 13 locals organized.

The California Lima Bean Growers' Association closed its 1917 pool May 12.

W. H. Fleet has resigned as director of the California Lima Bean Association.

The Orange County Fruit Exchange expects to ship 1800 cars of Valencias this season.

The 1916 crop of lima beans in the hands of the association is practically cleaned up.

The Beaumont Fruit Growers' Association expects to market 25,000 boxes of apples this year.

The beet sugar companies have announced an increase in price of beets to induce larger planting.

Governor Cantu of Lower California has agreed to allow no cottonseed brought into the state without inspection.

Horticultural Commissioner Waite of Imperial County has distributed 350 colonies of lady birds to clean up the melon aphis.

Hemet and San Jacinto people are uniting in a fair to be held October 16, 17, 18, 19, the week following the Riverside fair.

Riverside's citrus shipments for the season up to May 10 totaled 2701 cars, which is 352 cars above the total at this date last year.

Coachella Valley property owners are protesting against filings on Snow Creek and White Water River in the interests of Imperial Valley irrigationists.

The postmaster general has issued an order that berries and soft fruits sent through the post office must be placed in containers heavy enough to prevent crushing.

At the first series of farm bureau meetings in Riverside County the newly appointed adviser, W. B. Parker, will discuss preparation of ground for beans and sorghum.

Sugar beet companies of Southern California have agreed to turn over to growers for each cent above five cents per pound for sugar received by the factories one dollar per ton for the raw beets.

The Coast

Caldwell, Idaho, is cultivating 1000 acres in vacant lots this year.

Gooding County, Idaho, has a county farm labor bureau which is doing good work.

Large shipments of California beef steers are being received on the Portland market.

Washington state prison has a large herd of Holsteins which it is planned to increase to 90 by fall.

Fifteen hundred Arizona boys and girls have signed up in different kinds of agricultural club work.

The Rocky Ford district of Colorado reports 2500 acres planted to cantaloupes and 300 to Honey Dews.

Both butter and egg prices have dropped considerably in the Seattle market owing to heavy supply.

The Spokane land bank has made its first farm loan to the Eureka, Montana, farm loan association.

Apple growers of Wenatchee, Washington, are getting together to fight the proposed freight rate increase.

Farmers of the Northwest are considering advisability of bringing in Oriental labor to correct shortage of help.

The farm market bureau of Idaho has just purchased 100 tons of alfalfa hay in Canyon County for shipment to Bear Lake County.

Several counties of Arizona are considering appointment of county agents. Among them are Pima, Pinal, Coconino, Yavapai and Yuma.

Boys and girls of Washington, who were members of pig clubs, garden clubs, sewing clubs, canning clubs, etc., last year earned $118,000.

The state of Idaho pays bounties on wild animals; $2.50 on coyotes, minks and wild cats; $10.00 for bears and wolves; $25 for cougar and mountain lions.

The annual meeting of the Oregon State Grange has been postponed to June 12 because of lateness of the planting season. The meeting will be held at Astoria.

Apple and pear growers in the district about Dallas, Oregon, have formed the Dallas Fruit Union, with the object of bettering handling and packing of fruits.

Saturday, May 12, was Farm Defense Day in Oregon, when meetings were held of agricultural associations all over the state to make plans to relieve the food situation of the nation.

Business men and orchardists of the Hood River section of Oregon have decided to put into force a working day from sunup to sundown. Women and children are expected to help in the fields when the berry season comes on.

April Report of San Joaquin County Cow Testing Association

By William F. Elder, Tester

THIS association is gradually enlarging and assuming a permanency that at one time seemed doubtful. The entrance of five new herds last month promises to make the production standards even higher than heretofore. The dairymen are beginning to realize that only by increased production can they keep pace with the increased cost of labor and feed, which means the elimination of the boarders and small producers.

The following are the five leading herds in butter fat production for the past month, giving name of owner, number cows in herd, average pounds butter fat: F. J. Kell, Stockton, 16, 44.1; Gotshall & Magruder, Ripon, 17, 38.5; O. Fowler, Banta, 24, 35.9; M. N. Yokum, Bellota, 24, 35.5; H. T. Bailey, Lodi, 50, 32.2.

The following are the five leading herds in milk production for the past month, giving name of owner, number cows in herd, average pounds of milk: F. J. Kell, Stockton, 16, 1317; Gotshall & Magruder, Ripon, 17, 1105; M. N. Yokum, Bellota, 24, 1005; O. Fowler, Banta, 24, 952; R. W. Fisher, Ripon, 20, 887.

The following cows produced 50 pounds or over of butter fat during the month of April, giving name of owner, cow, breed, pounds milk, test, pounds butter fat: F. J. Kell, Stockton, 447, H., 2319, 3.1, 71.9; County Farm, French Camp, 67, H., 1776, 3.7, 65.7; Mrs. E. C. Clowes, Stockton, 53, 1788, 3.6, 64.4; Gotshall & Magruder, Ripon, 2, H., 1647, 3.9, 64; O. Fowler, Banta, Daddies, H., 1708, 3.7, 63.2; N. H. Locke Co., Lockeford, 133, J., 1209, 5.3, 62.8; F. J. Kell, Stockton, 63, H., 1884, 3.2, 61.4; F. J. Kell, Stockton, 65, H., 1722, 3.5, 60.3; County Farm, French Camp, 105, H., 1755, 3.4, 59.7; Gotshall & Magruder, Ripon, 6, H., 1740, 3.4, 59.4; Mrs. E. C. Clowes, Stockton, 91, JH., 963, 6.1, 58.7; Gotshall & Magruder, Ripon, 5, H., 1782, 3.2, 57.6; N. H. Locke Co., Lockeford, 230, J., 1047, 5.4, 56.5; C. Holman, Stockton, 27, H., 1449, 3.9, 56.5; F. J. Kell, Stockton, 66, H., 2607, 2.7, 56.2; S. Gronner, Ripon, 1521, H., 1404, 4, 56.2; F. J. Kell, Stockton, 16, H., 1374, 4, 55; C. Holman, Stockton, 1, 1435, 3.8, 54.6; Oak Grove Dairy, Stockton, Nigger, HJ., 1212, 4.5, 54.5; S. Gronner, Ripon, 1506, H., 1338, 4, 53.5; H. T. Bailey, Lodi, 52, H, 1029, 5.1, 52.5; O. Fowler, Banta, Fanny, H., 1611, 3.2, 51.5; R. W. Fisher, Ripon, 24, H., 1419, 3.6, 51.1; Gotshall & Magruder, Ripon, 7, H., 1707, 3, 50.7; H. Bailey, Lodi, 31, H., 1395, 3.6, 50.2.

Southern California Duroc-Jersey Center

That the Duroc-Jersey is primarily the hog for Southern California is evidenced by the tremendous popularity the breed is showing with hog men in that portion of the state.

In the last year the demand for this red hog has been far greater than the local breeders could supply and Duroc breeders have been forced to bring in large numbers from the Eastern states, paying as high as $60 per head for express alone. Our Western breeders have not been backward in selecting what they wanted from these Eastern herds, regardless of price, and as a result Southern California is coming more and more to be thought of as the home of the Duroc-Jersey in the West. Other portions of the state and even neighboring states are drawing heavily on it for breeding stock with which to build up the herds in those localities.

The formation of the Southern California Duroc-Jersey Breeders' Association in October, 1916, was a long step towards stabilizing the breed, and to the breeders behind this association is due a large measure of the credit for the remarkable showing the Durocs have made during the last year.

Although the number of Durocs raised in Southern California probably exceeded that of any other breed, there had never been any of these prolific red hogs shown at the Riverside fair (the largest live stock show up to this time in Southern California), until 1916. In that year the backers of this association, getting together, fitted their herds for the show ring and easily outnumbered any of the other breeds shown. The association members are planning for a great showing of Durocs this year at both the Riverside fair and the new Los Angeles live stock show.

All persons, not already members of the association, interested in the production of better Durocs in Southern California, are urged to send their names to the secretary of the association at once, so that definite plans may be worked out for the coming show and sale season.—S. O. Houghton, president, Van Nuys; R. K. Walker, secretary, Devore, San Bernardino County.

Worms and Lice---Detecting and Fighting Them

By R. L. Hill, Field Secretary National Duroc-Jersey Record Association

IT is decidedly important that hog men take every precaution against worms and lice in their herds, if they expect to get the greatest profit from their efforts. Just recently I received a pamphlet, published by the agricultural extension service of the University of Missouri and prepared by Dr. L. S. Backus, giving information on the manner in which to detect worms and lice and the proper methods of combating them. The following is an excerpt from this practical pamphlet which will doubtless be of much value to any man owning hogs:

"In cases of especially severe infestations of stock by parasites, a veterinarian should be called to make a diagnosis and recommend such treatment as would be indicated under the existing conditions.

"Infestation may take place through the medium of an infested animal, infested premises, and infested foods.

Lice and scab mites may pass from one animal to another when the animals are in close contact, or a healthy animal may be infested from the harness, blankets, bedding or stalls of an infested animal.

"An animal which harbors mature worms passes thousands of worm eggs daily. In a few days, especially under damp and warm conditions, these eggs hatch. The young worms live in bedding, or the damp soil, or in pools of water, ready to be taken into the digestive tract of another animal where they grow to maturity. Animals sometimes suffer severely from parasites when they are so small they are not easily recognized on post-mortem examination. However, the immature parasites are expelled more readily by worm remedies which often have little effect on the more mature worm. This explains how the frequent feeding of some comparatively simple worm medicine often prevents severe infestation with worms.

"As the worms become larger they may form serious obstruction to the passage of food materials and excreta through the intestines. Or they may interfere with nutrition to such an extent that the host actually suffers starvation even though food is abundant.

"Intestinal parasites are commonly spoken of as round worms, pin worms or tape worms.

"The round worms vary in size in different animals. They are most common in the pig and horse and may be from five to 15 inches long. In the horse they may attain the diameter of a pencil. They are white and pointed at both ends. They inhabit the small intestines.

"Pin worms vary from one inch to several inches long and are much smaller in diameter than round worms. One end is usually somewhat blunt. They inhabit the large intestines.

"Tape worms are flat and segmented and vary in length from a fraction of an inch to many feet, and are generally found in the small intestine.

"The effect of worms upon an animal is usually in direct proportion to the number present. Where a few may apparently do no harm, under favorable conditions for their propagation they may speedily become a menace to the life of their host. Limited quarters and a large number of animals foster their propagation. The healthy animals become infested from those which harbor the parasites.

"Damp and badly ventilated inclosures, ponds and poorly drained pastures are conditions favorable for hatching parasite eggs and retaining the young parasites. Wet pastures may be unsafe for several years.

Symptoms

The symptoms vary, depending upon whether the invasion takes place gradually over several weeks, or whether it is acute. The animal has a good appetite, often eats more than normally, fails to gain or may lose weight. The skin becomes rough and dry. Horses may eat the bedding. Presence of worms in the excrement may often be noted. In severe invasions animals may die in large numbers and such invasions have been mistaken for some acute disease, such as cholera among hogs, fodder poisoning or anthrax in horses.

"The economic loss which results from stunted growth and falling off in condition is probably greater than the direct loss by death. Parasites lower the animal's vitality and often prepare the way for other diseases.

Worms in Hogs

Symptoms of worms in hogs are good appetite without proper gain, convulsions, cough and thumps, passage of worms. Post mortem showing worms within the intestine.

Treatment.—Hogs if properly handled are comparatively easy to treat for worms. The following formulas are recommended:

Formula 1.—Santonin, one dram;

HOLSTEIN-FRIESIAN CATTLE

Registered young bulls from best families. Some of serviceable age.

REGISTERED BERKSHIRE PIGS

Masterpiece, Longfellow and Robin Hood Strains. Fine individuals of both sexes—we pay registration fee.

Careful attention given to mail orders.

Whittier State School
Whittier, Calif.

Retained Afterbirth

When the membranes remain in the uterus of a cow and decompose, inflammation of the lining of the womb may be caused, and this, with the absorption into the blood of the products of putrefaction, lead to ill-health, emaciation, diminished milk supply, failure to breed, and often blood poisoning and death. HOOD FARM BREEDING POWDER causes the afterbirth to come away naturally in a few days, and thoroughly cleanses and disinfects the parts, leaving the cow in normal condition for breeding. Write for full information and prices, mentioning this paper.

Every De Laval equipped with Bell Speed-Indicator

NEW DE LAVAL CREAM SEPARATOR

THESE are the days when you are getting *more milk in the pail,* and with butter-fat at its present high price you want to be dead sure that you are getting *all the cream out of the pail.*

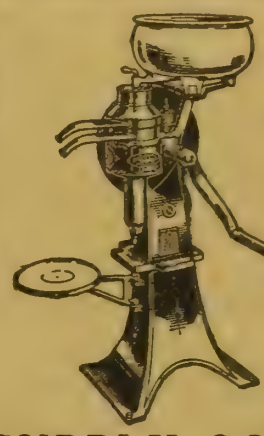
You certainly can't afford to feed butter-fat to the calves and pigs at from 30 to 40 cents a pound.

All sorts of "*claims*" are made for various cream separators, but what you are looking for is "*proof.*"

Here is the most convincing kind of proof that the De Laval is the cleanest skimming machine:

Fifteen years ago there were a dozen different makes of creamery or factory separators in use.

Today the creamerymen and large milk plants the world over use the De Laval almost exclusively. In fact, it's hard to find a large cream producer or creameryman who will allow any separator other than a De Laval in his plant, no matter what the price.



Why? Because they have found that it makes a difference of several thousand dollars a year to them whether a De Laval or some other make of machine is used. They simply can't afford to use any other machine.

This is proof of De Laval closer skimming that you can't afford to ignore. Even if you don't separate as much cream as the creameryman, you can't afford to waste it any more than he can.

Your local De Laval agent will be glad to let you try out a New De Laval on your own place. If you don't know the local agent, write to our nearest office for catalog or other information.

When writing advertisers, mention The Cultivator.

calomel, two drams; powdered areca nut, five ounces. Mix. Dose—One heaping teaspoon for every 100 pounds weight, or the formula is sufficient for 20 pigs averaging from 50 to 100 pounds.

"Note: Areca nut is an efficient worm remedy, but it loses its strength, and care should be exercised to procure the fresh drug.

"Withhold all feed for 24 hours. Give medicine in light feed or wet mash, and after six hours give one ounce of Epsom salts, per 100 pounds weight, mixed in a slop. This treatment will be found very effective. If the pigs are of different sizes, they should be divided into lots so that pigs of equal weight will be together. This will enable each pig to get its share of the remedy.

Formula 2. — "Powdered copper sulphate (blue stone). Dose, one teaspoon per 100 pounds weight, or one ounce to every eight pigs of 100 pounds weight each.

Directions

"Give in a thick mash (a mash of corn chops and bran is preferable) morning and evening, after having fasted the animal for 24 hours. Give the following morning mixed with the slop, one ounce Epsom salts per 100 pounds weight.

Formula 3.—Turpentine—Dose, one half ounce (or one tablespoon) per pig. One pint turpentine will be sufficient for one dose for about 30 pigs, weighing from 50 to 100 pounds.

Directions

"Prepare pigs for treatment as recommended under Formula 1. Give one tablespoon turpentine per 100 pounds weight, mixed with a light feed of thick mash or skim milk. Repeat for three successive feeds. Follow last dose with one ounce Epsom salts per 100 pounds weight, mixed with slop. There is no danger of overdosing with turpentine, since if too much is given, the pigs will refuse to eat the mixture.

"Formulas 2 and 3 are desirable because they are cheap and easily obtained. Turpentine and copper sulphate when used as previously directed, have been found safe and effective worm remedies for the hog. "Some reports hold that turpentine and copper sulphate have in some cases produced abortion of pregnant sows. We have no conclusive evidence, however, that such is the case. Pregnant sows are less frequently infested with worms. When treatment is necessary, Formula 1 is recommended.

"Many swine raisers make a practice of keeping equal parts of salt and ashes or equal parts of salt, ashes and charcoal in the pig lots for the hogs to partake of at will. These mixtures, although not very efficient as a treatment for worms, are of value as preventives, and such a simple mixture as salt, ashes and charcoal, if kept accessible to the hogs, will be of value in preventing worm infestation."

L. A. Webster, field editor of the American Sheep Breeder, is "doing" the coast, passing through Southern California last week, and is in Central California this week. With wool around 50 cents and mutton out of sight for the ordinary buyer, the wool grower is becoming some autocrat and the work of Mr. Webster and his paper should be made easy.

Every cream separator should have a good speed indicator. If you run your separator too fast you will soon wear it out, and if you turn it too slow you will lose cream.

PROTECT YOUR STOCK

increase your profits, comply with the sanitary demands of health authorities, milk companies, etc., and at a saving of time, cost and labor!

Make your stables, dairies, poultry houses and cellars, bright, cheerful and free from lice, mites and the germs of infectious diseases! Instead of using whitewash and then a disinfectant, use

CARBOLA
the Disinfecting White Paint

It disinfects and paints at the same time.

It is a finely powdered mineral pigment combined with a germicide 20 times stronger than pure carbolic acid, but absolutely non-poisonous. Will not harm man, beast or fowl.

Ready to apply as soon as mixed with cold water—no waiting, straining or bother as with whitewash. Can be applied with either brush or sprayer. Dries a clear white. Will not blister, flake or peel off. No disagreeable odor. If your dealer cannot supply you, send us your order and his name.

10 lbs. (10 gals.), $1.00 and postage.

Breeding Stock For Sale
G. A. Murphy - Perkins, Cal.

Beware of Recently Imported Males

Stockmen in Arizona know that males recently introduced from the East are of little value for some months for breeding purposes. Our experience has been that during the first week or two after ariving in Arizona these males will get calves, lambs or colts, but after this time the climate seems to affect them so they do not breed until they become acclimatized. There is something in the climate or in the change from other districts that deranges the system to such an extent that the normal functions of breeding are interfered with or arrested for a period. It has been found that introduced animals are more susceptible to disease, such as pneumonia, than those accustomed to the climate. On this account there is a higher percent of mortality from animals shipped in from other places. Many of them become thin and do not look well in our climate until becoming accustomed to it.

Stockmen should plan on bringing in breeding animals, males and females at least six months before it is desired to have them used for breeding purposes. During this time the animals should become accustomed to the change and environment. Those intending to bring animals in for sale should also plan to sell them within two weeks after arriving or keep them for at least one-half year when they will recover the lost condition and appear to better advantage.—R. H. Williams, Animal Husbandman, University of Arizona.

Silage Reasons

T. E. Woodward, of the dairy division of the Kansas state board of agriculture, furnishes twelve good and well-considered reasons for the farmer providing himself with a silo. Every one of them touches some spot of vital importance to the larger profit of dairy farming. Here they are:

1. More feed can be stored in a given space in the form of silage than in the form of fodder or hay.
2. There is a smaller loss of food material when a crop is made into silage than when cured as fodder or hay.
3. Corn silage is a more efficient feed than corn fodder.
4. An acre of corn can be placed in the silo at less cost than the same area can be husked and shredded.
5. Crops can be put in the silo during weather that could not be utilized in making hay or curing fodder.
6. More stock can be kept on a given area of land when silage is the basis of the ration.
7. There is less waste in feeding silage than in feeding fodder. Good silage properly fed is all consumed.
8. Silage is very palatable.
9. Silage, like other succulent feeds, has a beneficial effect upon the digestive organs.
10. Silage is the cheapest and best form in which a succulent feed can be provided for winter use.
11. Silage can be used for supplementing pastures more economically than can soiling crops, because it requires less labor, and silage is more palatable.
12. Converting the corn crop into silage clears the land and leaves it ready for another crop.

Raising Hogs

The department of agriculture is sending out a circular calling attention to the imperative need for more hogs. It says: "At the present time a large part of our pork comes from the few states in the corn belt, where it is the common belief that hog raisers possess advantages that farmers in other sections lack. This, however, is not altogether true.

"In the extreme west the alfalfa of the irrigated valleys and the clover of the coast districts furnish a good foundation for successful pork production. In most of these regions there is an abundance of small grain, particularly barley, that may often be fed economically, and corn is successful in some localities.

"Hitherto, where corn has been cheap and abundant, it has been used so extensively for feeding to hogs that there is a widespread notion that it is the best feed. Investigations, however, have shown that it has its disadvantages as well as its advantages. When it is the exclusive grain feed, breeding stock are not as prolific as on a varied ration, and for fattening purposes an exclusive corn diet is not generally profitable. The hog is naturally a heavy and promiscuous eater. He thrives best where pastures are plentiful and grain crops, nuts or roots are most abundant. He must have water at all times and shelter in winter. If these conditions are met hog raising can be made profitable outside of the corn belt as well as in it."

Do Pure-Breds Pay?

Last week an Illinois farmer who has been in the dairy business all his life sold at public auction 16 head of grade Holstein cows, one of them with a yearly record of over 10,000 pounds of milk to her credit. He has not gone out of the dairy business, only out of grade cows. Several years ago the first pure-bred cow came to his farm, and he has been steadily building a pure-bred herd, which he now has with no grades on the place. This man is a practical dairyman. What he has his cows have brought him. He grew into the dairy business at the start, with grade cows, and now he has grown into the pure-bred business, with market milk still the chief source of revenue. It cannot be said that he has not had experience. He has worked good grade cows and pure-bred cows side by side and has made his choice. There is nothing new or unusual in this story. Many other live stock men have traveled the same route. But it should be significant for those who are depending on grade cows, and particularly for those who renew their herds by purchase. The best cows seldom change hands, and the best way to get good cows is to buy a bull out of a high-producing dam and raise the best of the heifer calves. For in these times of high cost of feed and labor there is no place for the inferior cow on any farm that is run for profit.—Farmers Review.

GREAT FOUNDATION HOLSTEINS

IN

The Quality Sale

STATE FAIR GROUNDS
SACRAMENTO, CAL.
THURSDAY, MAY 31, 1917
Beginning promptly at 9 o'clock a. m.

If you want some of the best bred registered Holstein females ever led into a sales ring; cows with good 7-day official records; cows with great yearly semi-official records; heifers that are bred in the greatest producing lines of the breed; cows and heifers in calf to great sires; open heifers of splendid breeding, ready to breed to your own herd sire

Come to the Quality Sale

If you want a real herd bull, bred in the lines that are making the pace in milk and butter records; bulls backed by generation upon generation of transmitting sires and dams; bulls backed by immediate large yearly milk and butter records; bulls backed by great individual excellence of type and themselves of show quality

Come to the Quality Sale

A daughter of Spring Farm Pontiac Cornucopia, out of a 31-pound dam; a daughter of Sir Skylark Ormsby Hengerveld, sire of a 34-lb. and a 31-lb. daughter; a daughter of King Korndyke Sadie Vale, the only 40-lb. sire with a 40-lb. daughter; a daughter of King Segis Pontiac; a daughter of King Walker 5th; a granddaughter of King Mead of Riverside; a cow with semi-official records above 19,000 lbs. milk and 800 lbs. butter in one year; and others of equal breeding and merit are among the great females to be sold.

Come to the Quality Sale

A son of a 33-lb. daughter of King Hengerveld Aaggie Fayne; a son of Finderne Pride Fayne out of a daughter of the 41-lb. cow, Valdessa Scott 2nd; a son of Prince Gelsche Walker out of a good A.R.O. cow that has a semi-official record of over 18,000 lbs. milk and over 800 lbs. butter in one year; a son of Judge Lyons out of a splendid A.R.O. daughter of Lottie Walker Spofford, the only cow to make five official records above 30 lbs. butter in 7 days; a grandson of Tilly Alcartra out of a 28-lb. daughter of Johanna McKinley Segis; and others of splendid breeding and type are among the excellent young bulls to be sold.

Come to the Quality Sale

And when you come to this sale remember: That these good animals have been selected from great breeding herds in the belief that they are the sort of animals upon which to build high class breeding herds; that there will be absolutely not a single by-bid nor reserve on a single animal in this sale; that every consignor has signed an ironclad guarantee that every animal is exactly as represented; that every precaution has been taken for your protection in buying at this sale.

SEPTIC TANK

Continued from Page 587

The sewer pipe leading from the house to the tank should have a slope of one foot per 100 feet. All the joints should be carefully cemented. The trap and air vent near the tank are essential. It does not give off an offensive odor and can therefore be near the house.

Where there is no great drop from the house to the tank the tee on the inside of the tank (as shown in the plans and specifications) can be left off, this tee being put on to distribute the incoming sewage and avoid stirring the surface of the sludge mat. The intake pipe should go into the tank to within 14 inches of the bottom of chamber number one. The four-inch pipe going through the partition between chambers one and two should be set at an angle of 45 degrees with the upper end in chamber number two. Two three-inch pipes placed at the same angle may be used in place of the one four-inch pipe, the lower ends being in chamber number one, 14 inches from the floor of the tank. This can be left to the preference of the person installing the tank. The object in placing this pipe at a 45 degree angle is to exclude all air from chamber number one. The outlet pipe from chamber number two should be bent down to within 14 inches of the bottom of the tank. This will make the liquid clear that escapes through the waste pipe. When the construction of the tank is completed, the manholes can be sealed with cement, which can later be broken should it ever be found necessary to get into the tank.

The underground distributing system is made of four-inch non-glazed tile so laid as not to have the joints meet too close, nor at a very sharp angle at connections, since this might cause them to stop up. The slope could be one foot per 200 feet or more. This underground distributing system will sub-irrigate a garden or field, and if the tile are laid deep enough, e. g. 18 inches, a plow will never touch them nor will there be any odor given off.

The materials necessary for constructing tank are as follows:

Four yards gravel; 18 sacks cement; one trap; two elbow joints and one cross tee; sewer pipe laid from house to tank and enough tile to make the underground distributing system.

The average cost of installing in Napa County where all the work was done by the farmer, has been $16.50 for materials. Where all labor was employed or where contractors built the tanks the average cost was $30.

According to these plans, the bacteria work in both compartments which clarifies the liquid before it escapes into the distributing system. If the installation work is properly done this equipment will need no further attention for it will work automatically. The tank can be built underground so that the farming operations can be carried on above it or a garden may be growing there. In some places it has been found necessary to build above ground, in which case they also work successfully.

SUGAR BEET CULTURE

Circular 165; "Fundamentals of Sugar Beet Culture Under California Conditions," by R. L. Adams of the college of agriculture, Berkeley, may be had for the asking and it contains a fund of valuable information to the beet grower.

Boost Your Citrus Trees Now

The grade of fertilizers determines the grade of Citrus Fruits. Chilean Nitrate has one hundred per cent of its Nitrogen Nitrated, and is ready to go into action the instant it is applied. It brings quicker, surer results than all others because they have to be Nitrated first. Why not buy your farm munitions ready for use, not subject to losses which the other Nitrogens always suffer? Common sense dictates that money is saved by its use. Its low price compared to others strongly commends it to the business grower.

DECORATION DAY

Down the path that leads to the river,
Stands a white slab, grim and tall,
Above it wave the treetops,
And the birds in the branches call;
But all the air is silent when
Its words are softly said,
The thrilling words "Our Country,"
The sorrowful words "Our Dead."

"Our Country," its hills and valleys
Stretch far to the setting sun;
And under the Arctic Circle,
Where wonderful deeds are done.
Thence far to the suns of the South-
land,
We may find our flag afloat,
And ever, where we find the flag,
We find that other note,—

"Our Dead," the hills and valleys
Are dotted here and there,
And many the heart that sorrows,
With a glance at a vacant chair;
Yet, was it father or brother?
The soldier who marched away
To the notes of the martial music,
And is sleeping here today?

"Our Dead," to their memory ever,
Is this day in honor due,
And let each year bring tribute
From a nation, loyal, true.
Heap high the fragrant blossoms,
The roses of white and red,
In memory of our loved ones,
"Our Country" and "Our Dead."—
Nellie Fiske Hackett.

THE GUEST OF HONOR

By Anne McQueen in Youth's Companion

(Concluded from Last Week)

Rheumatism might have seized him as a result of too prolonged exposure, but it was not often that the old man slept under the stars. Every farmhouse opened to him with a hearty welcome, and no one would take a penny from him for bed or board.

At last, browned by the pleasant summer sun and wind, although somewhat stiff in his joints, old Mr. Tiller entered the great city where the reunion was to be held. He still had several of the original ten dollars in his pocket.

The roar and traffic rather bewildered the old man, and now that he had reached his goal, he was uncertain where he should apply for accommodations. The other old soldiers would come by train, and would be met by a reception committee; none of them would walk, as he had done.

Absorbed in thought, he failed to notice the warning horn of an approaching automobile, and was brushed aside in a heap before the driver could change the course of the machine.

Fortunately, he got no serious injury; only a sprained ankle. The doctors at the hospital said he would soon be about; but old Mr. Tiller confided to the nurse that it was a mighty hard thing not to be able to march with the "boys," when he had walked 200 miles to take his place in the parade.

"Two hundred miles!" exclaimed the sympathetic nurse. "Dear me, how wonderful! It ought to be in the newspapers, Mr. Tiller!"

In a very short time Mr. Tiller had a visitor, a pleasant young man who talked to him about the things nearest his heart—the little farm that for some reason had never produced enough to pay for a trip on the cars; the little granddaughter who had kept his secret with him, the long journey, and the pleasant people on the road to the reunion, and—last of all, the pitiful end—to be laid up with a sprained ankle instead of marching with the "boys"!

The newspaper the next morning printed the story on the first page with big head-lines. The consequence was that a large, opulent-looking motor-car rolled up to the door of the hospital, and a distinguished looking gentleman alighted, and asked to be taken to the casualty ward.

The sympathetic nurse hurried on ahead, and whispered joyously to Mr. Tiller that the governor himself was coming to call on him!

Presently the distinguished looking stranger was saying, in the heartiest, pleasantest voice imaginable:

"And this is Mr. Tiller of the Fighting 43d, who has marched so far to see us! I am the governor, Mr. Tiller, and in behalf of the state and of the city, I bid you welcome!"

"I voted for you!" Mr. Tiller declared, with enthusiasm, as he grasped the governor's hand. "I voted for you—and I've never had cause to be sorry I did!"

"Thank you, Mr. Tiller!" The governor laughed. "And now do something else for me. Let the nurse get you into your clothes, and we will help you out into my car. My wife and I want you to be our guest while you are in the city. She made me come bright and early, so that the mayor, or somebody else, should not get ahead of me."

Thus it happened that old Mr. Tiller, who could not march in the ranks with his comrades, viewed the parade comfortably seated in a luxurious car, by the side of the governor of the state. Later, he was tenderly assisted to the speakers' platform, where he sat between the governor and the mayor, and listened with delighted appreciation to the speeches of welcome and the responses.

Many persons wondered why the insignificant little old man in butternut jeans should occupy so prominent a place. Near the end of the exercises, the mayor told them.

"Ladies and gentlemen," said the mayor, "here is one of our beloved veterans who has walked 200 miles for the pleasure of being with us today. As a mark of the city's appreciation, I ask that you give three cheers for Mr. Tiller—our guest of honor!"

Thereupon a mighty cheer swelled and thundered from a thousand throats—a joyous welcome to the guest of honor!

Mr. Tiller's hosts sent him back in a Pullman car, with particular instructions to the conductor to take good care of him on the road. The governor's wife bought a beautiful doll to go into the knapsack for Mary Ellen, along with various other gifts that Mr. Tiller had bought with the remaining dollars, and that he intended as peace-offerings to the family at home.

"You ought to have told me how much you wanted to go, father," his son said, reproachfully. "I'd have tried to raise the money some way. It was a mighty rash thing in a man of your years, undertaking to walk that distance."

"Shucks! Didn't I march with the infantry for four years? What's a trifle like 200 miles for a man that's got all his faculties?" replied old Mr. Tiller.

But to Mary Ellen, nursing her doll in the contentment of fulfilled desire, he confided, "It was mighty lucky for me, honey, that one of those pesky things knocked me down. For it's a fine thing to be a 'guest of honor';

The Cultivator Patterns

8304—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. Any of the pretty checked materials can be used for this waist.

8286—Girls' Dress. Cut in sizes 4 to 12 years. Sleeves may be long or short and the dress has a straight lower edge.

8316—Ladies' Dress. Cut in sizes 34 to 42 inches bust measure. The dress has a Duchess closing, one-piece gathered skirt with slightly raised waistline.

7934—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. One or two materials can be used to make this waist.

8296—Children's Rompers. Cut in sizes ½, 1, 2 and 3 years. The rompers are in one piece and have a short kimono sleeve with or without cuff.

8298—Ladies' Skirt. Cut in sizes 24 to 32 inches waist measure. The skirt is a one-piece, straight gathered model.

7962—Ladies' Apron. Cut in sizes 36 to 40 inches bust measure. The apron is cut in one piece and has a yoke facing.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

and I was just a little grain dreading the walk back. I have my faculties, thanks be, but—I don't mind telling you, Mary Ellen—I'm not capable of holding out as long as I used to when I was young."

HOME CANNING

Written for California Cultivator
By Alice Palla, Linne

SUGGESTIONS for home gardening can well be followed by recipes for home canning. Next to raising vegetables is the art of preserving them for family use. Besides reducing the food bill it is so very satisfying to go to the storeroom for canned vegetables and fruit.

I enclose four recipes which I successfully use, hoping they may help some housekeeper. I hope to see some recipes for green corn and peas.

I like the Economy jar best for steam cooking. Covers are easily adjusted. Place rubber and clamp lids, but not tight, until vegetables are cooked. If not enough for wash boiler at one canning I use a five-gallon coal oil can with pan or board covering. This holds four two-quart or five one-quart cans.

String Beans and Tomatoes

Pick tender young beans, string carefully, cut in lengths, wash, pack in jars, add salt, fill with cold water, place in boiler. I use wash boiler with slats in bottom), fill with cold water up to necks of jars, place rubbers, screw tops on loosely, bring to boil, boil hard with cover on boiler for four hours. Remove jar covers, fill to overflowing with water from teakettle, replace covers, seal tightly, turn jar upside down. Stand in water until cold. Wipe stove. I can tomatoes the same boiling hard for about 15 minutes.

Sauerkraut

Cut nice white solid young cabbage with kraut cutter. Pack in stone jar or small keg, hammer down with wood mallet, salting as packing until jar is full. Cover with cabbage leaves and place weight on so juice will cover (if not enough juice rises add some water). Let stand until good kraut. Then cook in granite kettle (adding water if not juicy enough) until tender then seal. This keeps well if we put up enough at our house.

Olives Ripe or Green

We like ripe olives best. Pick without bruising. For five gallons olives one can Red Seal lye dissolved in about five gallons water (use enough to cover olives well). Time about 12 to 24 hours. Watch closely. As soon as lye reaches pit put on fresh water, changing often until lye is all gone. Salt slightly about third day after using fresh water. When you have lye all out and cured they are ready for canning. Proceed same as for green beans, boiling hard for one hour. These keep well and are firm and delicious for the lovers of the olive.

WHAT DID SHE MEAN?

A bishop had occasion to preach in one of the smaller Southern cities, and as soon as the service was over many people went to him to express their appreciation of his sermon. One woman in particular was most outspoken in its praise. "Why, bishop," she said, "you can never know what your sermon meant to me. It was just like water to a drowning man!"

CONTINUOUS MORTGAGE

A motorist says: "I mortgaged my house to buy my automobile. Then I mortgaged my automobile to build a garage. Now I have mortgaged my garage to buy gasoline."

ECONOMY IN TABLE LINENS

Written for California Cultivator
By A. M. H.

WHEN one must economize closely it is far better to buy the unbleached linen, and the ordinary washing and boiling will soon make it as white as desired. By watching for special sales a good grade of linen may often be bought at a very moderate price, and the short lengths of linen can be made into serviceable tray and carving cloths. Small patterns are best as they wear longer than the large designs. An undercover of canton flannel makes the tablecloth look better and it will last a third longer as it prevents the table from wearing the linen, especially around the edges where even the neatest darning is so noticeable. A tablecloth will last longer if it is not folded in the same creases every time it is ironed. The center crease should be moved an inch or so on either side occasionally, or a few inches may be cut from one end and one side and all the folds will be altered, thus giving the cloth a fresh start. The tablecloth should be hung evenly on the line, for if they are allowed to dry out of shape, stretching and pulling them will wear them more than use.

Table linen will last twice as long if it is never allowed to become so soiled as to need hard rubbing, and the best way I have ever tried for keeping the pieces soft and white is to put the pieces to soak in warm suds made with borax soap chips and let them remain for an hour, then more hot water is added and the pieces pressed and squeezed between the hands until clean. A small quantity of the soap chips are dissolved in hot water and then stirred in the wash water until a strong lather is made before putting in the pieces. This suds is especially good for the pretty embroidered pieces and the dainty crocheted articles, and it is a good plan to wash the linen separately instead of putting it in with the general washing, and it really is no more work when once you have become used to this plan.

A tablecloth will last longer if it is always hung across the line with the ends down, so that the weight while wet may come upon the lengthwise threads as the warp threads are much stronger than the filling. When a large cloth is too much worn to be used upon the table, the four corners are still good, and they can be made into tray and carving cloths, and there is nothing nicer than the large pieces for wrapping up light bread when it is put away, and the small pieces are invaluable as bandages for cuts and wounds or for hurts of any kind.

USES OF GRAPEFRUIT

Grapefruit Pie—One cup of sugar, mixed with two round tablespoons of cornstarch, one teaspoon butter, two yolks of eggs, rind and juice of one half lemon and one-half orange, juice of one-half small grapefruit, one cup of hot water. Cook in double boiler, stirring constantly until thick. Cook ten minutes longer in order to cook cornstarch thoroughly. Put into a baked crust, make a meringue of the two whites and two cups of sugar, put on pie and brown in a very slow oven.

Pineapple and Grapefruit Salad—Arrange lettuce leaves on individual plates. In the center of each put a round slice of canned pineapple which has been drained and chilled. On this arrange perfect sections of grapefruit which have been skinned and chilled, being careful to conform to the circular shape of the pineapple. Sprinkle these lightly with powdered sugar. Surround with mayonnaise dressing into which has been lightly folded a little whipped cream just before using and in the center of the fruit place three stoned California cherries or the same number of Maraschino cherries.

Buttermilk Cure for Disease in Young Chicks

BUTTERMILK has been proved a cure for one of the two most fatal diseases of young chicks in California—coccidiosis. Since one of the most practical ways of increasing the food supply in the present great national emergency is to prevent needless disease among domestic animals, there is particular timeliness in this announcement, just made by the University of California.

This costly disease of coccidiosis is caused by the tiny protozoon organisms known as "coccidia." Usually the chicks thrive until they are a few weeks old, and then begin to droop, and often whole flocks of chicks die within a month or six weeks after the appearance of the disease.

An outbreak may be controlled by sanitary measures and by proper feeding. The sickest of the chicks should be isolated from the others or killed and burned. The chicken house should be cleansed with a strong, hot, disinfecting solution. The floors should be covered with a thin litter of shavings, chopped alfalfa hay, or straw, and this should be swept out and burned daily. Feeding and drinking vessels should be kept scrupulously clean.

The method of feeding is very important. The infected flocks of chicks should be fed a small amount of grain night and morning, and mash during the middle of the day, but this mash not offered for more than two hours daily. Buttermilk should be kept constantly before the chicks. This restriction of the grain ration will keep the chicks hungry, and they will consume large quantities of buttermilk. The result will be the constant presence of acid and a healthy condition of the mucous membrane of the intestines, which will prevent the multiplication of the coccidia which cause the disease.

The university last January had an outbreak of this disease in a flock of 730 two-months-old chicks. Already 60 per cent of the chicks were visibly sick when the disease was discovered. The infection was unusually severe. Use of this buttermilk method brought about immediate improvement. In less than three weeks all evidence of the disease had disappeared, with only a five per cent death rate. In spite of limiting the grain ration, the chicks made normal growth on a diet primarily of buttermilk.

Means of fighting the other most serious disease of chicks—"bacillary white diarrhea" or "fatal septicemia", which, once started, seldom kills less than half the flock—are also set forth in this same university publication. There is no really satisfactory method of treating chicks thus affected, so the great thing to attempt is prevention of the spread of infection, by separating all sick chicks from the rest of the flock, scrupulous sanitary precautions, and the use for hatching of eggs from flocks known to be free from infection.

TWO IN ONE

Mrs. Potter of Ceres writes that she has a curiosity in a large white egg which she at first supposed was a double-yolked egg but when broken open it was found to contain as much of the white as an ordinary egg. Another perfectly formed egg was found to contain a dark-colored hard shell on the inside, with an outer shell of white.

There isn't enough Pages in this paper

to repeat even half of the enthusiastic praise which the Big Poultry Feeding Stations, Poultry Authorities, Pure-Bred Poultry Breeders and Farm Poultry Raisers have said about **Milkoline**—if you'll try it, you'll say something nice too.

We Don't Ask You To Take Our Word—Read This:

Zirkle & Coffman, Breeders Thoroughbred Poultry, Virginia, write: Enclosing check $12.50. Please ship ten gallons Milkoline. Have used with such success that neighbors want some. Will not have enough to see us thru. Have not had case white diarrhoea among chicks so far, last year we lost about half them with it.

W. G. Tainter, Kansas, writes: Have been using Milkoline for few months and getting greater number of eggs per hen than any year since going into business on larger scale. Ship me half bbl. more. I would rather be without grain than Milkoline, as it is a tonic as well as a food.

½ BBL. MILKOLINE 32 GAL. $1.00 A GAL.
10 GALLONS MILKOLINE $1.25 A GAL.
5 GALLONS MILKOLINE $1.50 A GAL.
1 GALLON MILKOLINE $2.00
ONE GALLON OF MILKOLINE
IS EQUAL TO 50 GALLONS ORDINARY BUTTERMILK

The wonderful assimilating and digesting qualities are highest in **Milkoline** of any known feedstuff. Adds vitality, growth and fattening—eliminates Diarrhoea and disease.

CAREFUL HANDLING REDUCES DIARRHEA LOSSES.

By observing the methods of correct poultry raising, the loss from diarrhea in little chicks can be greatly reduced. Ninety-five per cent of the diarrhea is not due to the white diarrhea germ but to other causes. Among them are the following; says a correspondent of the Missouri College of Agriculture.

A little chick is apt to become chilled, which will cause it to have diarrhea. This chilling may result from indiscreet use of the nursery tray of the incubator. If newly hatched chicks are put in a temperature of 80 degrees they will become chilled and diarrhea probably follow.

Again, many fail to warm the container which the chicks are to occupy. The hands and cloths with which the chicks are covered should be warm. After they are placed in the brooder, it should be kept at a temperature of 95 to 100 degrees the first week and reduced about one degree a day until the right temperature is reached. They should be kept warm enough so that they do not crowd at night and they should always be afforded a cool place to which they may go if they desire. Chicks raised with the hen should not be let out until the grass has become dry because a wet chick is apt to become chilled.

Another cause is the overheated incubator or brooder which may interfere with natural absorption of the yolk and cause trouble after the chicks are about a week old.

Then too, diarrhea may be caused by feeding musty or sour food or allowing them to scratch in musty chaff.

In some cases it may be caused by the white diarrhea germ which is said to be present in the ovary of the mother hen, and, if this is the case, extreme sanitary precautions should be observed. Care should be taken to use only the most vigorous breeding stock available. The incubator should be cleaned and disinfected between all hatches, and the brooder should be disinfected every time a chick dies. The incubator door should be darkened at hatching so that healthy chicks will not pick up the droppings of diseased chicks. The drinking water should be colored a claret red by the use of potassium permanganate and the chicks should be fed sour skim milk as soon as they begin to drink.

To fatten fowls quickly confine the birds in a small and somewhat darkened pen, allowing about two square feet for a mature fowl and one square foot for young chickens. Do not feed for the first 24 hours, then begin feeding rather scantily, increasing the amount gradually until at the end of two or three days they are getting all they will clean up in about 20 minutes, when fed regularly three times a day. This should continue for two weeks which is ordinarily as long as the fowl can stand heavy feeding.

As soon as the old hens become broody and as soon as the services of the roosters are no longer needed they should be disposed of. Feed at present prices necessitates reduction of non-producers.

The recently organized Washington Cooperative Egg and Poultry Association already has an enrollment of 550 members. The headquarters of the association are at Seattle.

The high cost of chick feed and the low price of eggs was discussed exhaustively at the last meeting of the Arlington Poultry Association.

HAY

Under date of May 19, Scott, Magner & Miller say:

Arrivals for the week have totalled 1582 tons, a considerable increase over arrivals of last week.

With the exception of some first cutting alfalfa, there have been no extra arrivals of new crop. The market has been steady throughout the week. A steady consumption from day to day has readily absorbed current arrivals.

No old hay has accumulated, either in the hands of dealers or consumers on account of the abnormally high prices prevailing.

Crops have been immensely benefitted during the last two weeks by the damp, cool weather that we have been having with showers in some sections; in fact, the increased yield on account of the recent favorable weather is most wonderful from the reports we have been receiving from every section of Central California. All in all, one section with another, it looks as though we would have very satisfactory crops of both hay and grain.

There has been quite a little new first cutting alfalfa moving through this market, selling at very satisfactory figures.

COUNTY COMMISSIONERS' CONFERENCE

State Horticultural Commissioner George H. Hecke has issued a call to each of the 47 county horticultural commissioners of California to attend a conference at Modesto Wednesday, and Thursday, June 6 and 7.

Matters of deep concern to the fruit industry of the state will be discussed. California's $150,000,000 fruit crop deserves particular attention as it will be one of the biggest contributions the state can offer to meet the extraordinary demand for food.

The meeting on Wednesday will be addressed by A. F. Naftzger, vice president of the state council of defense; B. F. Crocheron, representing the University of California; George H. Hecke, state commissioner of horticulture, and others. Thursday's meeting will be executive and devoted to subjects of interest to the state and county commissioners, giving particular attention to new additions to the horticultural laws of the state under which the county horticultural commissioners are acting.

WHY THE GUERNSEY?

"Why the Guernseys are at Hollow Hill farm" is the title of an attractive illustrated booklet by G. W. Wilder, proprietor of Hollow Hill farm. The book contains many things of interest which were learned by the owner of the farm while in search of the dairy cow he thought to be the best. It is an excellent presentation of the merits of the Guernsey and the manager of the ranch writes that he will be glad to mail a copy to all dairymen who request it. Write Hollow Hill farm. Colton.

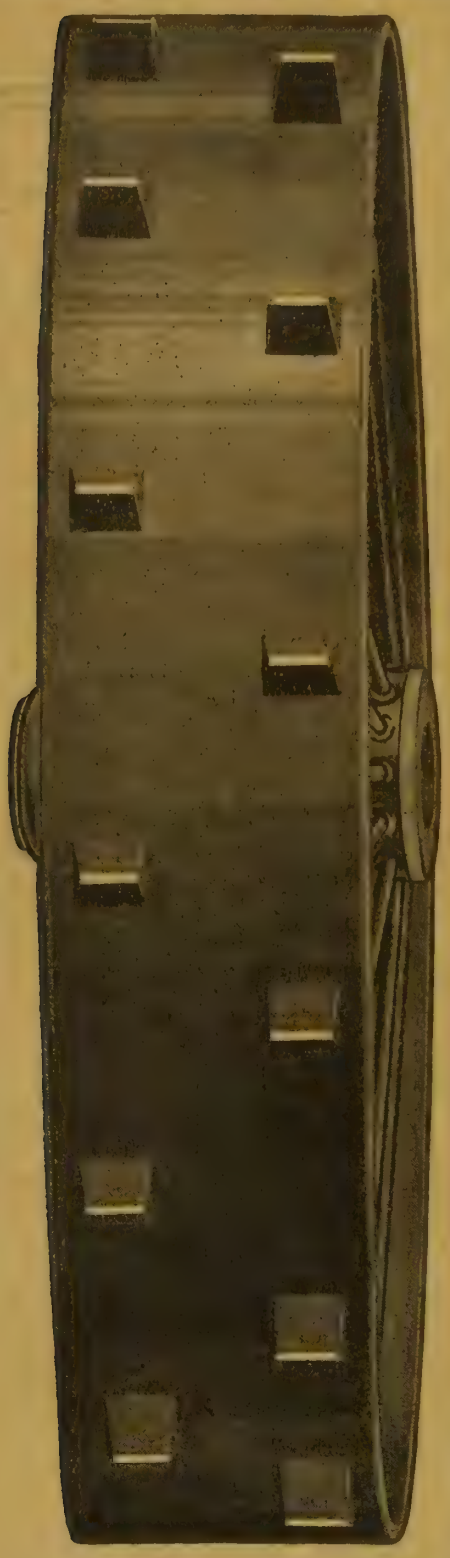
THE ORIGINAL 2-WHEEL TRACTOR



That Does All Farm Work WITHOUT HORSES

When you come to buying a tractor, whether for a farm of 80 acres, 280 acres or more, there are a number of questions you will need to ask yourself before you buy. Here are some of them:

—Will it CULTIVATE as well as plow?
—Will it do ALL my farm work without horses?
—Will it work on plowed ground without packing the soil?
—Will it do the work quicker; easier; and save on hired help?
—Is it REALLY a one-man tractor?
—Will it handle as easy as a team of horses, rather than be too heavy, clumsy, and inconvenient?
—Do I ride on the tool where I can see the work I am doing, or will I have to have someone run the tractor while I am operating the farm implement?

The tractor that answers these and all other farm power problems most practically, and profitably is the

ORIGINAL MOLINE 2 WHEEL UNIVERSAL TRACTOR

This is the original Two-Wheel Farm Tractor. It pulls two 14-in. plows; will disc, harrow, plant, CULTIVATE all hill and row crops, pull mower, binder, manure spreader, fill your silo—and do all belt work on the average farm. In fact, it will do anything you can do with horses; do it quicker; easier; and with less hired help. It weighs only 2,800 lbs., but all its weight being on its two wheels—*all its weight is traction weight.* The tool you hitch it to, forms the rear wheels and you do not have to pull around a ton of needless weight. It will back up with tools attached easier than a team will back. You can turn around in a small space; get close to the rows and the fences. It is the ideal tractor for the farmer because it costs less than four horses; is as powerful as five horses; does more work than seven horses; is inexpensive to operate; and eats only when it works.

Write for our new Tractor Catalog and read how farmers everywhere are solving the power and hired help problems on their farms; how they are changing the drudgery of farming to a profitable pursuit. Learn how you can make your work easier and get it done on time and grow bigger, better crops. Write today.

MOLINE PLOW CO., Dept. 49 Moline, Illinois

The Moline Line includes: Corn Planters, Cotton Planters, Cultivators, Corn Binders, Grain Binders, Grain Drills, Harrows, Hay Loaders, Hay Rakes, Lime Spreaders, Mowers, Manure Spreaders, Plows, (Chilled and Steel), Reapers, Scales, Seeders, Stalk Cutters, Farm Trucks, Vehicles, Wagons,

Hog and Hominy

A Perfect Rice Binder Engine

Guaranteed For Life

MADE FOR YOUR RICE BINDER, as well as for general, all-around power purposes. The "NEW-WAY" has met with unqualified success in the rice and grain fields of the South.

Light and compact—no bulky, heavy water cooling system. Easily attached by patented bracket. Mounted on sub-base, this new model is especially suited for all-around work. Readily moved from one job to another on hand truck or skids.

THE "New-Way" ENGINE
GOES AND GOES RIGHT

Has lightest operating weight of any engine built for RICE, grain or corn binder; faultless jump-spark-ignition—high grade automobile carburetor; multiple disc clutch pulley; enclosed, oil tight, dust-proof, hinged crank case; direct cooling accomplished without any moving parts except fly wheel of engine.

Investigate the "NEW-WAY" now. Full information on request.

Built in 1 to 12 H. P., both vertical and horizontal. Prices according to size and equipment. Send for catalogue No. 43

Ask your dealer about this engine. mt23

Cut Citrus Crop Losses by Summer Spraying

PROTECT YOUR PROFITS WITH TRIUMPH AND BORDEAUX

Don't wait until fall to use an insecticide on your trees. By then the insects will have done irreparable damage.

Reduce insect injury to the minimum by spraying your grove this summer before the larvae mature with our TRIUMPH and Bordeaux combination spray—Scientifically Right, Grove Tested, Commercially Satisfactory. It is not a "shotgun" mixture.

The TRIUMPH and Bordeaux Combination is a Fungicide as well as an Insecticide. It controls insect pests and fungus diseases at the same time at the cost of one spraying. It is safer as regards spotting of fruit and tree injury than is a straight insecticide.

The supply and price of Triumph and Bordeaux are certain. Stocks are on hand in Los Angeles and San Francisco. Quotations upon request.

Clip and mail the coupon for our new free book, "Spraying of Citrus Trees." It is crammed with new, accurate information, formulas and quantity tables.

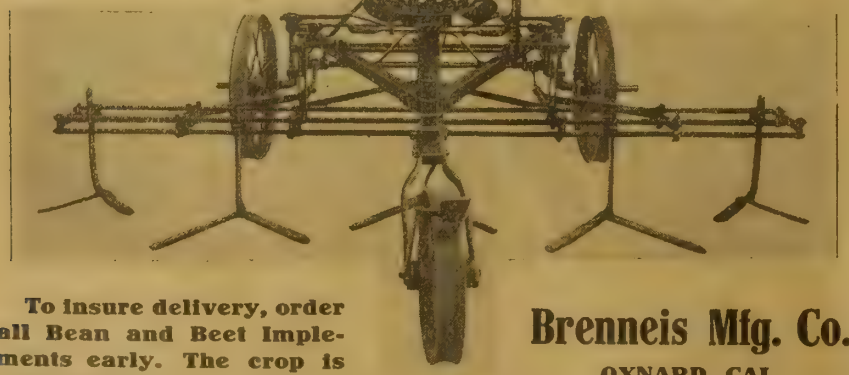
THE BRENNEIS LABOR SAVING TWO ROW RIDING BEAN CULTIVATOR

This is the best and most successful two row bean cultivator on the coast. Made to do the work quickly and thoroughly and to stand up under California conditions. Write for descriptive circular and price list of all our bean and beet tools.

Labor is scarce and wages high. Every labor saving implement is a money saver. With the BRENNEIS two row riding bean cultivator one man can do the work of two men cultivating.



To insure delivery, order all Bean and Beet Implements early. The crop is large and materials scarce.

Brenneis Mfg. Co.
OXNARD, CAL.

there's Health in this Can

Chocolate is an appealing food—perhaps the most delicious of all foods. It is likewise *nutritious* food—perhaps the most nutritious.

When you buy Ghirardelli's Ground Chocolate you get the grand prize winner, a chocolate of finest quality packed in a hermetically sealed can that holds all the Ghirardelli goodness in and keeps all outside evils out.

California Cotton Possibilities

From an Address Before the National Association of Cotton Manufacturers in Boston Last April by Walter E. Packard of the Imperial Valley Experiment Station

THE total annual production of 75,000 bales of cotton does not place California and Arizona very far up the list of cotton producing states, but a knowledge of the natural resources in climate, soil and water of these valleys inspires a feeling of confidence in the possibilities of future development. The total area of arable land suited to cotton is small as compared to the great cotton areas of the South, but the factors of growth are so wholly under control where irrigation water is available that it is reasonable to expect great results from intelligent effort, in the production of superior quality and large acre yields.

Cotton is grown at the present time in Imperial and Salt River Valleys and in smaller areas along the Colorado in both California and Arizona. By far the largest acreage is in Imperial Valley. Between 400,000 and 500,000 acres are under irrigation, making this the greatest unit irrigation project in America.

The Salt River Valley of Arizona comprises some 180,000 acres of land adapted to cotton culture, of which some 4000 acres are now devoted to the production of Egyptian cotton. Experimental trials have conclusively proved, as did the commercial plantings in the 60's, that cotton can be successfully grown in both Sacramento and San Joaquin Valleys of California. These great interior valleys which stretch over 400 miles north and south with an average width of 40 miles, have a total area of 10,000,000 acres, nearly 2,000,000 of which are under irrigation. Although, as previously stated, cotton has been grown in these valleys, there is no commercial planting at the present time. Outside of the valleys above mentioned there are several smaller areas where climate and soil are favorable for cotton culture. The Yuma reclamation project, including some 127,000 acres, of which about 26,000 are at present under irrigation, the Palo Verde Valley of Riverside County, California, covering 80,000 acres with about 20,000 acres under irrigation, the Parker Valley of Arizona, which is at present an Indian reservation with little irrigation, and the Coachella Valley, comprising over 100,000 acres in the upper end of the great Salton Sink where 5000 acres are irrigated from wells, are all potential cotton growing sections of considerable importance, as demonstrated by the experience of recent years.

To those who have traveled through the Southwest, the statement that the climate is arid may appear axiomatic. The rainfall in Imperial Valley averages between two and four inches a year, which about equals the average monthly rainfall in the South. A dry fall in the cotton belt, which is considered so essential for good picking, is, of course, only relative as compared to a dry fall in Imperial Valley, or Arizona where no rain occurs at all during a large portion of the picking season. The rainfall in the Salt River Valley is slightly greater than in Imperial Valley, especially during the late summer months, but not enough to mature any but the most quickly maturing crops, such as the Tepary bean. In the San Joaquin and Sacramento Valleys of California the rainfall is still greater, varying from four inches at Bakersfield, ten inches at Merced, to 26 inches at Red Bluff, most of this coming during the winter, which is the rainy season. By proper conservation of moisture with the utilization of dry farming methods, quick maturing winter crops, such as wheat or barley, can be grown on the valley lands without irrigation. Summer crops of corn or cotton can also be successfully raised without surface irrigation in those bottom lands where the water plane is sufficiently close to maintain the moisture percentage of the soil above the wilting point during the growing season. Eighteen hundred pounds of seed cotton were produced per acre on a small panting of Mebane Triumph cotton on the Kearney Estate near Fresno in the San Joaquin Valley this year. This cotton was planted in March and received no irrigation during the entire season. Satisfactory yields have been secured on like plantings in other seasons. Cotton has been raised on the bottom lands in Kern and Merced Counties in the 60's without artificial irrigation and as much as one and one-half bales to the acre secured. From 24 to 36-acre inches are usually added to a cotton field during the growing season, while crops such as alfalfa require as much as four to six feet.

The isolation of an irrigated valley located in a vast desert is an advantage in the control of insect pests. At present boll weevil does not exist in cotton fields in either Arizona or California, and it is the opinion of competent entomologists who have investigated the local situation for the federal government that due to the careful inspections and rigid quarantine laws the boll weevil will probably never gain entrance.

Plants vary in their resistance to alkali salts, and one important method of utilizing these lands not too heavily impregnated is to grow crops having a strong resistance. Cotton is one of these, and can be grown on stronger alkali soil than many other field crops. In Egypt, alkali land is first reclaimed by flooding for rice and is then planted to cotton as the second crop in the rotation. Cotton has been grown on some of the white alkali lands of the San Joaquin Valley with success. There is, of course, a limit to the amount of alkali which cotton will stand, and one must figure carefully in order to make cotton a financial success on poor soil for the cost of production must not exceed the returns unless the benefit of irrigation on the soil is considered as an asset. The alkali apparently affects the strength of the staple and the price of the product is often discounted.

The varying soil conditions quite naturally demand different treatments, although the general operations are essentially similar. Before a crop is planted in a new section the land must be leveled. In some cases the cost is not great, not more than $15 to $20 per acre, while in other cases the cost exceeds $100 per acre. The item is the same charge against the land as is the cost of removing the heavy timber and underbrush in much of the southern country, or to the tile drainage now so common in the corn belt. The land is leveled with a Fresno scraper drawn by four horses abreast. Borders, or low ridges, are made from 30 to 40 or 60 feet apart to direct the water which is flooded over the surface. Barley is usually the first crop, and this is followed by alfalfa. After alfalfa has been on the ground for some four or five years the field is ready to plow up and to be planted to corn or cotton in a system of rotation where the land is put into cultivated crops every three to five years. Good cotton has been raised on raw land, but cotton planters prefer alfalfa land on account of the added life which alfalfa soil possesses.

While this pioneer work is going on, the family lives in a little tent house which serves to keep out the sun and wind and in many cases acts as a corral for the flies. Many of these tent houses, however, are built on such a plan as to serve most efficiently as a desert home. As the land begins to produce, conveniences are added and finally the permanent house is built and but for the occasional trips to the desert one would not know that he was so far away from the corn fields of Illinois or the old home in Tennessee.

The land is plowed in preparation for seeding. After plowing it is disked and harrowed to break up the lumps and sometimes irrigated by flooding. In February it is listed out, leaving ridges every three and a half feet apart. Small lath boxes are placed in the ditch so that there will be one opening for each furrow. A small stream is allowed to run down each furrow for from one to four or five days, depending upon the character of the soil. As soon as the field is sufficiently wetted the water is turned off and when the land is dry enough to bear a horse the field is harrowed both ways. This drags the ridge into the furrow, leaving a well pulverized and mellow seed bed. The cotton is then planted on this ridge by a one or two-row planter similar to the ones used in the South. From 20 to 30 pounds of seed is applied in order to insure a good stand. Immediately following planting it is customary to drag the field with a heavy board drag in order to compact the soil more firmly about the seed to insure germination. In the Salt River Valley the land is usually flooded and is not furrowed until the crop is up. The advantage, however, of furrowing is apparent, for it gives a more even distribution of moisture and enables the irrigator to bring up a stand of cotton by a second irrigation if the first one is not successful.

After the young plants attain a height of from three to six inches, the stand is thinned out with a hoe, leaving one good stalk of cotton from 12 to 18 or 24 inches apart in the row, depending upon the variety of cotton or upon the idea of the planter. Eight-

Why Europe Makes Bigger Crops Than the United States

Average Production of European Crops is as Follows:		Average Production of American Crops is as Follows:	
Wheat	33 bushels per acre	Wheat	14 bushels per acre
Oats	45 " "	Oats	40 " "
Potatoes	199.34 " "	Potatoes	97.15 " "
Cotton in Egypt	400 pounds "	Cotton	185 pounds "

European farmers use about 600 pounds to the acre of a Home-Mixed Nitrated Fertilizer containing 8 per cent of Phosphoric Acid and 4½ per cent of Nitrated or Nitratable Nitrogen.

American farmers apply 200 pounds to the acre of a Fertilizer containing 8 per cent of Phosphoric Acid, together with 2 per cent of Nitrogen which is mostly unavailable.

The difference in results is largely due to the large amount of Nitrated Nitrogen used in Europe per acre as **Nitrate of Soda.** Our pitifully small American yields are due to failure to appreciate the necessity of using Nitrated Nitrogen.

Notes on Avocado Varieties for a Commercial Orchard

From an address by Charles D. Adams before Avocado Growers Association

TO the increasing number who want to make a start toward planting commercial orchards of avocados there is no more important and puzzling question to which to find an answer than what to plant to produce an orchard that will prove permanently profitable.

One may frequently hear the current opinion expressed that we must wait ten years longer before we shall know what are to be our standard varieties. Possibly we may have to wait that long to get that knowledge, but we do not intend to wait that long to do our planting and from what we already know about it and what we already have in trees and fruit we can be reasonably sure we can produce orchards that will be permanently profitable even though no trees in them should ever find a place in the final standard class.

The discovery during the past season, of the ripening period of two imported buds and the much later ripening period of one of our older varieties than we had hitherto known, has given us winter bearing varieties and avocados of merit to market during every month in the year and that without needing to use very many varieties, so few that even three or four can be made to cover it.

Since we can now cover the whole year with varieties that are as good as some that we have, there is no need to be unreasonably timid about planting an orchard to continue profitable if we use few enough kinds, selected with sufficient study and good judgment.

The main puzzle, pertaining to the effect of future planting on what we may plant now, that remains to solve, is whether the superiority shall prove very marked which we may find in the best new kinds from Guatemala as compared with our present best kinds. Among the hundreds of thousands of trees amid which the United States government expert is now seeking the best—and among the selected imported Guatemalan buds soon to fruit here, there are almost certain to be some for which we shall want to reserve a space in our orchards.

Not too many kinds is a well proven element of success in orchard planting. Buyers are most interested and pay best prices where they can find large and continuous supplies of a definite article and growers find such marketing simplest and most economical. The California orange has been brought down to one standard variety for one half the year and one for the other half. The greater variation in taste, shape, size, color and period of maturity in the avocado compared with all other fruits will not permit of quite so few, but the nearer we can approximate to it with the very best for each period the better.

We are not here considering a few trees each of many kinds for our own testing or pleasure, which is quite a different matter.

Probably the main ripening season for the greatest number of our thick skin varieties is the summer, some of them beginning earlier and some continuing later. Then we have those maturing most of their crop in the spring, some of which would begin in the winter and finally those maturing most of their crop in the winter, some of which would come earlier and some later.

Vegetable Planting Calendar for June

Southern California

Written for California Cultivator By D. F. Reichard

THOSE who started to plant early this spring will begin harvesting in earnest this month. Although the weather has been cool and the season backward in general many of the hardier vegetables are coming out in fine shape.

Where crops are taken out soak the ground thoroughly and work it over in preparation for putting in summer growing stuff, such as squashes, both summer and winter varieties, cucumbers, melons, casabas, corn, both sweet and field, beans, and pepper, egg plant and tomato plants. All these things require water and should be planted only in soil that has been well soaked before working up. The seed should be planted to a depth at least four times their diameter, in damp ground, and firmed. This method will bring the seedlings up without any further watering. Keep the ground well cultivated to kill the weeds and to retain a dry mulch.

When water is needed apply by running furrows beside the rows and allow the water to run slowly through; cultivate as soon as it breaks up nicely without sticking to your tools.

When setting out plants wet them well, either by filling the hole to receive the plant with water, setting the plants in the mud and filling up with dry soil, or set the plant, firming the damp soil around the roots and fill a basin made around the plant with water; this will carry the plant for two weeks.

All stuff in the garden that is not matured keep well supplied with water and cultivate, for the evaporation is enormous during warm days. More and better products are gotten where vining plants are staked or trellised.

Northern California

Written for California Cultivator By A. R. Gould

IT is still necessary to survey the idle land and get more and more into cultivation as there is urgent need for one and all to do their duty to increase the food supply of the nation, as not only for our own people but it will be necessary for us to export our surplus to allied countries, and as the demand will be enormous we must get in every possible square yard. The canneries will require more beans, tomatoes, corn and other staple vegetables. Hence the opportuni-

ty is great. Root crops can be grown in abundance and successfully stored for the winter, and varieties of squash and beans can be grown which can be kept for months. Energy and foresight are essential and we must work hard and keep at it. The water question will probably enter into it and may seem to be a real obstacle. However it may be possible to extend a few pipe lines, use waste water, construct wooden water troughs with means of water control, and many methods may be adopted which will enable us to plant later and secure heavy crops. We have the rich soil and suitable climate to feed the world.

In these monthly notes we have dealt with the most profitable and important tested varieties, and we would advise a glance at the back numbers if additional information is desired. In these present notes we shall follow up and deal especially with crops it will pay to grow and store.

Squash

This is considered a big item for stock feed but they form a very important vegetable, and seeds may still be sown in small mounds well manured as advised last month. If these are well watered after sowing and mulched with leaves partly decayed they will germinate freely and will, after being once established, grow with very little water. The variety most used by the canners is Boston Marrow which is of excellent quality. Eight ounces of seed will be required to plant 200 pounds, or two pounds to the acre. Morse's Marrow is the largest type in cultivation, is first for a stock feed and makes a good vegetable. Perfect Gem and Hubbard are the best keepers.

Melons, Casabas or Winter

The casabas are good keepers and if stored in a cool place will keep through to January or February. It will be advisable to sow a number of mounds of the variety Golden Beauty and Winter Pineapple, both fine varieties. Keep these fairly well watered until established.

Tomatoes

There is still time to plant up many more of this profitable crop, and the fact that it will grow with very little water, providing the ground has been well cultivated should induce many to increase the acreage of these. They will need shading from the sun for a day or so after planting and a fair supply of water until established. Secure hardy plants of San Jose Canner and other good varieties and plant out without delay.

Beans

Providing the ground has been well cultivated and retains a certain amount of moisture it will be advisable to plant the small white bean. Tepary, which should sell well in the fall, as it is fast becoming popular. We have also pointed out before that it is adapted to dry soils and once started it will soon be able to take care of itself. Where it is possible to use the sprinkler or irrigation the other varieties mentioned last month may be grown. The soya bean when ground, makes a fine poultry food and is also well worth growing. It thrives best in a very warm situation and the bean also yields a valuable oil. Wherever these crops are growing they will improve soil conditions, and we would strongly advise planting up the orchards with them if only to enrich the soil. This may be kept in mind for plans another year as it would not be feasible to plant now unless there was considerable moisture in the surface soil, and in many localities this may not be the case.

Parsnips

This is an excellent root crop to plant in the garden and may be stored and even left in the soil for a considerable time. A sandy loam is to be preferred as it is deep rooting and difficult to dig in stiff soils. Sow at once in drills 18 inches apart. One-fourth of an ounce of seed will sow a 100 foot row. Hollow Crown is the best variety. Water moderately to assist germination, and when the plants are up cultivate between the rows and irrigate every few weeks.

Corn

Make another sowing of corn, Country Gentleman and Late Mammoth to keep up the supply.

Leeks

It is now time to plant out the leek seedlings in the prepared trenches which we advised sowing in the January calender. These should be planted about 12 inches apart in the trenches and well watered. Never let them get really dry or they will quickly run to seed.

Celery

If not already planted these may be also planted 12 inches apart in rows or shallow trenches and kept well supplied with water through the season.

Potatoes

The main crop of these will require earthing up, simply draw the soil up towards the plant either side making ridges which afford support and protection to the plant and young tubers. We advised this last month but some may not have been forward enough and we should like to call attention to this important work again.

Swiss Chard or Sea Kale Beet

It will be advisable to make a sowing of this now, as used in the same way as spinach it makes an excellent dish. It can also be cut several times and will sprout again. Those who have poultry will do well to plant it up in quantity. Large Ribbed White is a good variety to sow.

NO MORE ALLIGATORS

The Cultivator has always insisted on relegating to the scrap heap the unearthly name of "alligator pear." The California Avocado Growers' Association has also taken a hand in trying to correct the use of this term. The following resolution was passed at the recent annual session in Los Angeles: "Resolved, that the California Avocado Growers' Association does hereby request the various papers publishing market reports to use the name 'avocado' instead of 'alligator pear' and to class the same under the appropriate head of fruits and not under vegetables."

We would also suggest that the growers unite in the matter of pronunciation. At the convention in question speakers sometimes pronounced avocado with the "a" sounded as in cat. The a in the third syllable should have the sound of a in father.

Ornamental Planting Calendar for June

Northern California

Written for California Cultivator By A. R. Gould

IN the ornamental section weeding, cultivating and watering will be of first importance and many plants will need staking and tying to protect them from breaking in the height of their growth. Inspect all climbers and tie in as required.

Dahlias

Dahlias will require attention this month as they will need tying to stakes, and weak shoots must be pinched out. Old roots will generally throw quite a few shoots from the base, and only three or four should be allowed to grow up and upon these the best blooms will develop. Blackfly or aphis will most likely appear on the young shoots, but these may be destroyed by the application of "Black Leaf 40", a fine spraying solution

List of Varieties We Grow:-

Standard Oranges: Washington Navel, Valencia Late.

Standard Lemons: Eureka, Villa Franca and Lisbon.

Standard Pomelos: Marsh's Seedless, Triumph and Imperial.

Standard Limes: Tahiti Seedless and Mexican.

Standard Kid Glove Oranges: Dancy Tangerine, King Mandarin, Willow-Leaved Mandarin, Satsuma-Oenshiu.

Table and Ornamental Oranges: (Paper Rind, St. Michael, Ruby Blood, Navelencia and Jaffa.) Golden Nugget Navel, Golden Buckeye Navel, Sweet Seville, Bouquet des Fleurs, Golden Variegated.

Garden and New Citrus Fruits: Sampson Tangelo, Sweet Lemon, Sweet Lime, Golden Variegated, Ponderosa, Seedless Lemon, Citrus Limonum, (Dwarf Lemon), Thornless, Rangpur and Red Limes, Lue Gim Gong Orange, Nagami Kumquat, Algerian Satsuma Orange, Algerian Tangerine Orange and Citron of Commerce.

Combination Citrus Trees: Budded to from four to six different varieties of fruit.

Orange, Lemon, Pomelo, Lime Trees

Successful citrus fruit tree planters invariably pay more for Teague trees than they do for those of other growers. Why? Because experience has taught them that Teague trees yield better and more fruit than those grown with less care and attention. The practices of the successful are a safe guide for beginners and the inexperienced, showing where to "head in" to attain good results. . . . The cool weather of May makes June planting of citrus fruit trees not only feasible but opportune, as cloudy and rainy days followed by higher temperature are excellent for citrus tree growth. . . . Prices cheerfully furnished. . . . Telephone Home San Dimas 5.

which should be used when necessary.

Begonias, Tuberous and Fibrous, Rooted

There is still time to start a few of the former type in boxes of leaf mould placed in a fairly shady situation. The double, single, crested, fringed and pendulent, or hanging basket, types are all very pretty, and tubers if purchased at once and given attention will provide bloom for a shady situation well into the fall of the year. Those which were started earlier and by this time are planted in established quarters will need staking and careful watering. The fibrous rooted section will thrive in a fairly sunny situation. Begonia Vernon and Erfordi are both good for massing in beds. B. Weltoniensis will thrive in a semi-shaded position, as also will B. Maculata and B. Metallica, the latter being of tall habit and will make rapid growth in a season.

Climbing Plants, Sweet Peas, etc.

Permanent climbers will need some tying in as there will be many new shoots formed on the roses, jasmine and honeysuckle, etc. Regarding new plantings, if a quick cover is required against a fence, there is still time to sow seeds of the fall nasturtium in various colors or solid colors may be used and the ipomea or convolvulus, such as the sky blue type may also be sown. A very useful climber is cobea scandens which has trumpet shaped purple flowers. If young plants in three-inch pots can be secured and planted out they will make considerable growth this season, forming admirable cover for a trellis and if protected will live through the winter.

If a fall display of sweet peas is desired you should lose no time in sowing seed in prepared trenches. There is such a wide range of the Spencer types now on the market that it is quite a long job to make a selection. However, we think that Margaret Atlee, King White, Helen Lewis, Margaret Madison and Fiery Cross are some of the very best.

Chrysanthemums

The old clumps of these should ere this have been divided up and will be making considerable growth. In a few weeks the main shoots should be cut back to eight or ten inches above the ground if bush specimens are desired. Those grown on single stems are grown from cuttings which should now be ready for potting up. The soil mixture should be made up of garden loam, leaf mould and sand. Water carefully or the young plants are liable to damp off.

Petunias

Of all the free flowering plants and of those which delight in full sunshine petunias take first place. They are very suitable for situations where it is difficult to water and once established they will thrive with very little attention. The giant ruffled single types are very pretty and come in a vast range of colors, but for general bedding work and massed coloring Petunia "Rosy Morn," a neat compact form, pink flowered, is very satisfactory and should be widely grown. It is late now for raising them from seed but it may be possible to secure small rooted plants from one of the nurserymen advertising in the Cultivator.

The prospectus of the college of agriculture of the University of California for 1917-1919, giving outline of the agricultural work of the university is being mailed from Berkeley. Everyone interested in the agricultural college and its work should write for a copy of this bulletin.

THE NEW COTTON FIELDS OF THE SOUTHWEST

Continued from Page 611

een inches is a common distance, while the rows are from three and a half to four feet apart, the distance again determined by the variety of cotton grown.

On a sandy or sandy loam soil the water penetration is rapid and enough is often added in one application to keep up a steady growth. On a clay soil the irrigation is often inefficient on account of the slow penetration of the water and frequent irrigations are necessary to prevent wilting. Cultivation conserves the soil moisture and should be particularly thorough in an irrigated section for the essential feature in the irrigation practice is to maintain the moisture content of the soil as even as possible so that the roots will have an available supply at all times. This question of maintaining a constant moisture supply is the dominating consideration in the technique of irrigation.

Picking starts in August and is carried on through the fall and winter and often into March, very few days indeed being too damp for efficient work in the field. The cotton is piled in the field and is hauled to the gin as sufficient accumulates. The bales are stored in the open yards, which provides the best possible insurance against damage, for there is not enough rain to hurt the cotton and if a bale catches on fire it can be quickly and easily handled.

In a section so favored by nature, with a long growing season, abundant sunshine, and a supply of water that can be added or held off at will, it is important to select the variety best suited to conditions and which will yield the greatest net returns.

The necessity of selecting one variety for any particular section was early recognized by the planters. The cotton hybridizes so readily that if a promiscuous number of varieties are allowed to remain the task of maintaining pure seed in any variety would be almost impossible. Many varieties have been tried experimentally, some on a commercial scale, and many have given good results, but due to the necessity of limiting the number, but three varieties have persisted, Egyptian cotton in the Salt River Valley and Durango and Mebane Triumph in the Colorado River region.

All of the principal varieties of Egyptian cotton were introduced into California in 1902 by the United States department of agriculture. The results were not very encouraging at first as the quality and yield was not what was expected. In 1907 a selection was made from an apparent mutation in the field of Mit Afifi. This cotton was carefully grown and has resulted in what is now called the Yuma Egyptian. Mr. Thomas N. Kearney says, "This new type is distinguished from Mit Afifi by its relatively large bolls and long cream colored fiber, resembles the Nubari variety, which appeared in Egypt about the same time, in the shape of the leaves, bracts and bolls, but is superior in the staple and quality of fiber, which more nearly resembles that of the Egyptian Jannovitch."

Much interest in Egyptian cotton is manifest in Imperial, Yuma and Palo Verde Valleys on account of the high prices secured and it is probable that the Egyptian cotton acreage will be considerable in these valleys this coming year. The unfavorable labor condition in 1912 in Imperial Valley prevented the extension of the Egyptian cotton area in that section.

The Egyptian fiber averages from 1 7-16 inches to 1½ inches in length, is strong and silky and is especially adapted for use in low number yarns where great strength is required. The present supply of Egyptian cotton from Arizona is used almost wholly for the manufacture of tire fabric. The Goodyear Rubber Company, of Akron, Ohio, has leased 10,000 acres for the production of cotton for their own use. I understand that the Yuma Egyptian is preferred by spinners to either Sea Island or native Egyptian for use in these tire fabrics. The reason for this is not fully understood, although it is supposed that the fiber of the Yuma Egyptian possesses a superior twist. This quality has not been distinguished by microscopic examination, although the harshness is apparent to the touch.

Durango cotton is what might be termed a medium long staple variety. The fiber runs from 1 3-16 to 1 1-4 inches in length and compares favorably with the average long staple produced in the rich bottom lands. The Durango is easily grown and although somewhat sensitive to the heat of the dry summer months, is well adapted to the region. The first planting of 200 acres in 1912 has increased to 35,000 acres at the present time.

Mebane Triumph is not strikingly different from the cotton raised in Texas, although a premium of about 30 points is allowed by the buyers on account of the superior color and strength. The quality of both the Egyptian and Durango has been maintained by careful seed selection; in one case by the active work of the United States department of agriculture, and in the other by intelligent efforts on the part of a few growers. Continued attention must be paid to this very important work if the good results so far secured are to be expected in the future. The experience with the short cotton is an example of the result in the neglect of continued selection, for the ginning percentage, yield and evenness of fiber have so materially decreased in the past six years that many of the growers are looking for a supply of seed outside of the state.

(Continued Next Week)

DEPRECIATION OF FARM IMPLEMENTS

Have you ever kept track of your farm business by taking an inventory once a year, or by keeping account of all receipts and expenditures? Take account of all the farm animals, putting a fair cash value on them. In case of farm implements deduct ten per cent each year from cost price till three-fourths of the cost price has been deducted, then carry them on at one-fourth price as long as they are usable and stay out of the junk pile.

Preparedness Train

DURING the past twc weeks there has been operated over the lines of the Salt Lake Railway a demonstration train of more than a dozen cars, the aim of which was to carry into farming sections along the lines of that railway inspiration and information which should result in greatly increased production.

Car Devoted to Sugar Beet and Its Products

In connection with the railway people the staff of the Utah agricultural college and several members of the staff of the University of California united in making a most effective educational force.

The train started in Utah and the first two weeks of the trip visited points in Utah and Nevada, reaching the first California point, Victorville, on May 18. It visited Pomona, San Bernardino, Riverside, Whittier, Long Beach, Glendora, Pasadena and Los Angeles.

Contrary to the plan of demonstration trains formerly run in this state this train spent an entire day, with evening lectures, in each community visited. One car was given up to demonstration of bean culture, another to the growing of forage and grain sorghums, others to dairying, sugar beets, electrical appliances, especially installations which are possible on farms, home economics, poultry, and in fact every phase of California or Pacific Coast agriculture. On flat cars there were various types of tractors which at each stop were unloaded and the plows and other implements used to demonstrate most economical methods of soil preparation and tillage.

The corps of 20 expert instructors accompanying the train were kept busy from ten o'clock until four answering questions and explaining operations of various appliances. The evening lectures were given in the largest and most available halls in the cities visited.

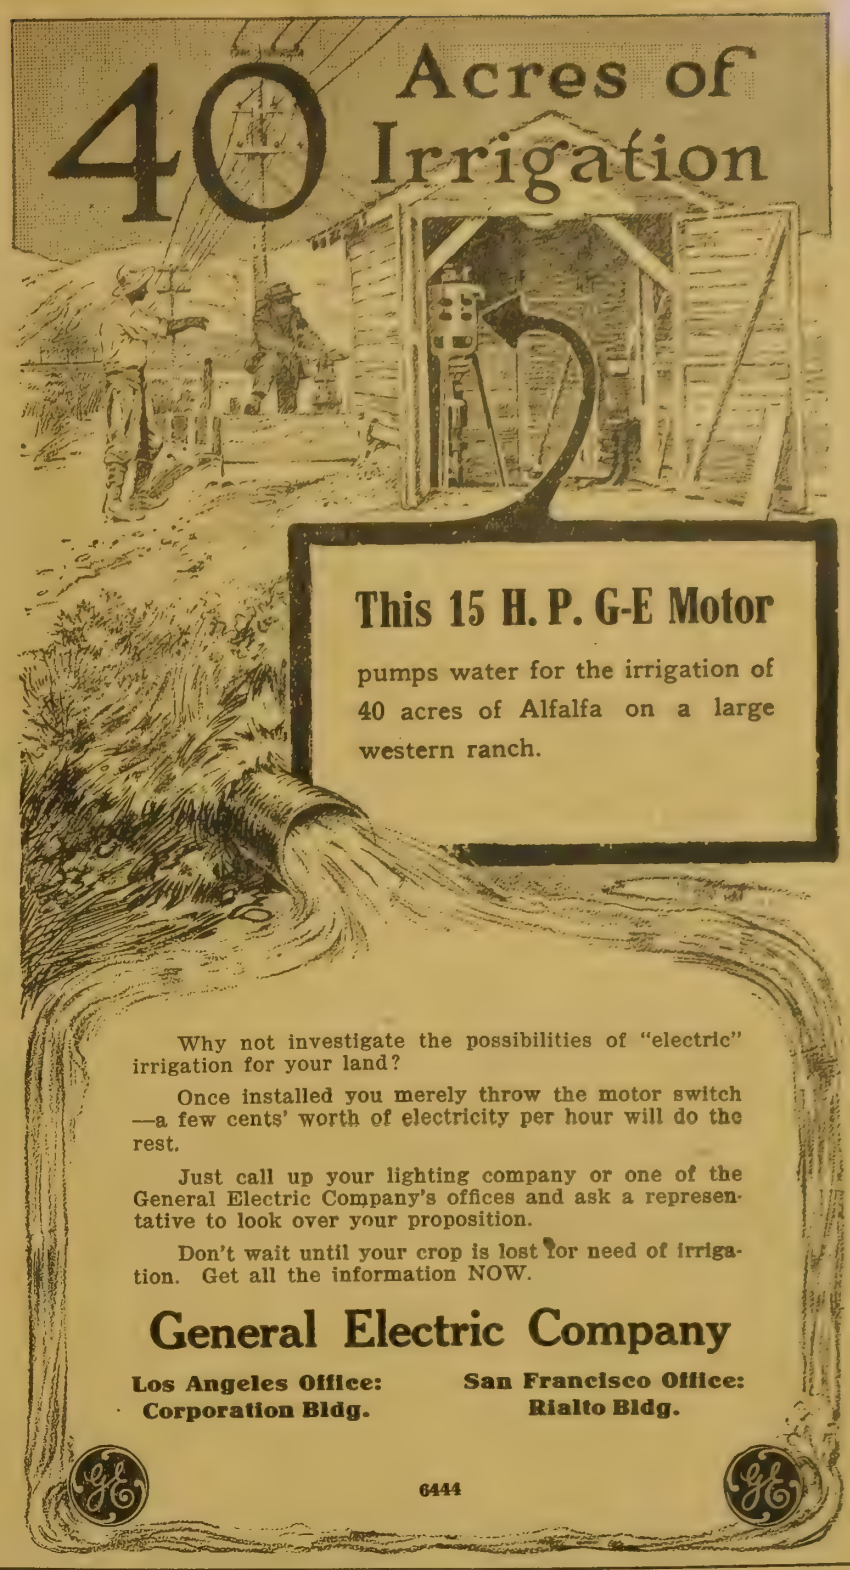
The train was under the direct charge of Douglas White, general industrial agent of the Salt Lake Railway, and Mr. White was busy at all times looking after the comfort of his guests, and after the spreading of information which means more and better production and incidentally more and better freight for transportation lines.

Prof. John T. Caine, director of extension work, Utah Agricultural College, and Prof. Knight of the University of Nevada, Dean Hunt, Dr. Webber and several professors of the college of agriculture, University of California, were with the train.

BENEFICIAL INSECTS

Superintendent Smith of the insectary division of the state commission of horticulture, received several shipments of beneficial insects from foreign countries this week. One shipment contained enemies of the beet leaf hopper; another destroys black scale on citrus trees. These insects were assembled in Australia by E. J. Vosler, former secretary to State Commissioner of Horticulture Hecke. The hopper parasite is being released in the sugar beet fields of Ventura County. Another shipment was received from the Philippine Islands containing enemies of the mealy bug. These were collected by C. P. Clausen, who is collecting beneficial insects in the islands and in China for the branch insectary recently established in Alhambra.

Electrical and Power Possibilities as Shown in One Car



40 Acres of Irrigation
This 15 H. P. G-E Motor
pumps water for the irrigation of 40 acres of Alfalfa on a large western ranch.
Why not investigate the possibilities of "electric" irrigation for your land?
Once installed you merely throw the motor switch —a few cents' worth of electricity per hour will do the rest.
Just call up your lighting company or one of the General Electric Company's offices and ask a representative to look over your proposition.
Don't wait until your crop is lost for need of irrigation. Get all the information NOW.

MORE CROPS

In these days of war and strife, the things we hear most about are more crops, and more abundant crops. Some eminent personage has said, "Whether for peace needs or for war necessities the use of fertilizer is the basis of crop production." The truth of this saying no one knows better than the man who uses Hauser's Organic Fertilizers. He gets more crops, more abundant crops and better crops.

Don't delay, communicate with Hauser Packing Company about your fertilizer needs, use fertilizer and get results.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Value of Green Alfalfa

Please advise what alfalfa behind the mowers at four dollars will equal in cured alfalfa hay in the field?—Subscriber.

If we get the idea the proportion would be about as one is to three. The department of agriculture makes the statement that if freshly cut alfalfa is worth seven dollars per ton alfalfa hay is worth $20.16. This is quoted by several authorities so we take it is generally accepted. We may also add that Woll's "Productive Feeding" gives the total dry matter in 100 pounds of green alfalfa at 28.1 pounds, digestible true protein 2.5 pounds and of energy 12.45 pounds, while alfalfa hay has of dry matter 91.6 pounds, digestible true protein 6.98 pounds and energy value 34.41 pounds. This would show the same general proportionate value.

Potato Seed

Will new potatoes make seed potatoes soon after digging?—Subscriber, Modesto.

If ripe there is no reason why they should not. In fact, all of the fall planting is from spring grown crop. A much larger percentage will be secured if the seed after digging are spread in at least partial shade and "greened." This ripens and aids in starting the new growth.

Keeping Away the Rabbits

Having seen in your issue of May 12 the complaint from a subscriber in Wasco as to the damage from jackrabbits eating off young beans, I have the following to suggest from my own experiments with beans on a small acreage in the foothills, exposed to rabbits and squirrels. At the first sign of damage to the sprouting beans I spread over the rows a light layer of straw, not enough to shut out the light, but merely to disguise and screen the young plants. While the rabbits are very apparent, they give these plants the go-by, and my troubles are ended. As the beans mature they project of course from the straw, and part of the foliage is obscured, but I make no attempt to conceal them, for the leaves are now mature and numerous enough so that some nibbling can be endured. They blossom and set the crop without serious annoyance. The only difficulty is in irrigating and cultivating, which the straw interferes with. At the same time it appreciably reduces the need for both. I wish that this simple expedient might come to the notice of many who are similarly annoyed and that it might prove applicable to some other crops. I am trying it out with a few garden vegetables as spinach and chard; with what practical success remains to be seen. —H. C. Tracy.

Bordeaux With Hydrated Lime

Please advise if hydrated lime will prove as effective as fresh burned lime in making Bordeaux mixture.—Subscriber, Los Angeles.

All the instructions we have at hand regarding making the Bordeaux refer to using fresh burned lime and makers of Bordeaux mixture think that it would be far safer. If, however, the trial is made with hydrated lime it would be advisable to use a greater quantity.

Ants

Please advise what will kill ants in the ground. I planted blackberries and raspberries but the ants eat off the leaves, and also the tomato plants. —Subscriber, Campo.

A strong solution of cyanide of potassium poured down the holes of ant hills, covering over with wet dirt or some other covering to prevent evaporation, will kill every ant. There are also most excellent preparations for the control of ants advertised in the columns of the Cultivator. We have known where these worked most satisfactorily. Scattering fresh buhach will also secure quick control. It is not often that ants eat vegetable growth. It has been charged that the Argentine and one or two other varieties are culprits in this respect. Possibly a close examination may show that other insects are responsible for this injury.

Poults With Rheumatism

Little turkeys at about three weeks die. Their toes curl right back. Seventy-five have died already. Am feeding chick feed and cooked rice.—Subscriber, Tres Vias.

(This subscriber asked for answer in last week's paper as her need is urgent, but that was impossible as paper was already on the press when question was received. Had she given her name the Cultivator would have been glad to mail answer direct.)

I think your little turkeys must have been running on wet alfalfa or in some other place where their feet got damp and remained damp for a good while at a time. Poults should have a wooden floor in their coop and should be well protected from rain and kept in when the ground is wet after a rain. I can only suggest that you keep the affected ones in a warm, dry place. Rubbing their legs with olive oil or some good liniment might help to cure the rheumatic condition from which they are evidently suffering, but prevention is the main thing. —J. A. K.

Colds and Swellhead

Some of my month-old turkeys have heads swollen, closing one eye. Nostrils show yellowish discharge and fowls sneeze and gape. They eat well. As soon as I find one affected I take it away from the others. They have large wire covered runs on east side of large coop, with sand in runs, protected from wind, plenty of water. Am feeding onions, crackers, bran and chick feed mixed with water. Should I feed this dry? Also feed some alfalfa leaves. Some of my little chicks have had same trouble, but turkeys have never been out so they could mix with the chicks.—Subscriber, Lucerne Valley.

Something is giving your chicks and poults colds. In some the trouble seems to have developed into swellhead or roup, in others it is just a plain catarrhal cold, but the cause is the same with all. There is something wrong in your care of them. Perhaps they are too closely confined. You say the poults "have never been out." Evidently there is lack of green feed, which is so important to the health of both chicks and turkeys. I am not told anything about their sleeping quarters nor how the poults are mothered. It is more than likely they are not getting sufficient air at night. This is a most potent cause of colds. Then again they may not be warm enough at night. If they are with a hen they are probably warm enough. If they are artificially brooded, they may not be. A small open front coop is best for turkeys, for there they can have absolutely fresh air. I should look first to the ventilation of their sleeping quarters, remembering that turkeys are birds of the open and cannot possibly breathe foul air and thrive. Then give them green range, if possible. Third, revise your ration. They need much more green than they are getting, and there is absolutely no reason for moistening the feed given to poults. Seeds and bugs and bits of green are their natural food, and they must have artificial feed as nearly approximating these as possible. A little chick feed is all right, but it must be very little. A few cracker crumbs, chopped with rolled oats and lettuce or onion tops, are all right, but make rolled breakfast oats and greens the basis of your ration and then add stale bread, crackers, cracked wheat, steel cut oats, broken rice or other fine grains, just a little at a time. About half of every meal should be greens, and the poults should have green range besides. I don't think your ration, except for the lack of greens, has anything to do with the colds, but you will have trouble later if you go on feeding wet bran and chick feed. Treat the sick poults by dipping their heads morning and night in a lard pail filled with slightly warm water in which a few permanganate of potash crystals have been dissolved. This will cleanse the nasal passages. Put them in a warm dry place, where they have unlimited access to green feed, and you will probably save most of them.—J. A. K.

Fall Peas

What month is best to plant peas for fall crop?—Subscriber.

Plant any time from September to the first of February or, in fact, in fact, in different sections peas may be planted almost every month in the year. August and September planted peas should be ready for the table by Christmas.

Sorghum Grains for Poultry

A subscriber writes regarding Mrs. Koethen's advice as to feeding sorghum grains to poultry that he finds the production of the laying hens is materially increased when he feeds the grain as soon as it is filled.

Fire Blight

I have a five-year-old apple tree which stands on a water ditch. Last year when the fruit reached the size of a large marble the leaves began to dry up at the ends of the limbs and the limbs to die back. I cut off and burned the withered portion and the trouble was brought under control, but this year the same trouble is oc-

Salt Your Hay

A little commercial salt (only 20 pounds to the ton), sprinkled in a hay stack or in baled hay, prevents mildew or mold. If you feed the hay, stock likes it better; if you sell it the hay holds its weight and sells for more. Salt costs less than hay and makes hay better.

We sell commercial salt, Morton's Salt Blocks and lump Rock Salt. Send for our free booklet "THE RELATION OF SALT TO STOCK FEEDING."

CHUBBUCK'S IDEAL GOPHER TRAP

Larger than runways; jaws pull rodent in; catches large or small gopher and holds it. Farmers say it's worth dozen other makes. Big sales. **Price 50c.** If not at your dealer's will send it to you postpaid 2 for 95c 6 for $2.70 12 for $5.10 Money back if you are not satisfied. Free circulars. E. J. Chubbuck Co. Dept A San Francisco, Cal.

curring again. Can you advise me what the trouble is and method of control? I sprayed the tree twice this year with arsenate of lead.—Subscriber.

As near as we can judge from this description this is nothing more nor less than pear blight, or fire blight, which affects many of our finest apples and pears. The cutting and burning of the blighted ends which appear as if they had been burned is the only remedy. One must be sure and cut back below the infected wood so as to be sure to leave only perfectly healthy wood. A precaution would be to dip the pruning shears in a solution of bichloride of mercury, one part to 1000, after every cut. The disease starts at the tips of the branches and works back toward the heart. Begin cutting as soon as blight appears.

Cantaloupes for Hogs

Please advise the feeding value for hogs from 40 to 100 pounds of cantaloupes at 12 cents. The hogs are on alfalfa pasture.

We do not think the cantaloupes would have any great value added to the hog ration. If the hogs were not on alfalfa pasture there would be a certain value obtained from the succulency of such feed. We find no estimate of their worth as a stock feed but would consider it lower than that of pumpkins. As to pumpkins "Feeds and Feeding" says: "273 pounds of grain together with 376 pounds of raw pumpkins gave 100 pounds of gain with fattening pigs." Cottrell of the Colorado station states that "some Colorado hog men fatten hogs exclusively on squashes. They report favorable returns per acre with meat of good flavor but having an undesirable yellow color." We will be glad to hear from any subscriber who has had experience in feeding cantaloupes to stock.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Cow Losing Flesh

I have a dairy cow that within the last month has become very poor. She eats and chews her cud but stands around and acts as if she had some foreign substance in her throat. She opens her mouth and lolls her tongue around frequently. Do not know whether her age has anything to do with it or not, but she is about 12 years old. I called a veterinarian and he examined the throat but could find nothing there. The medicine he gave seemed to relieve her at first but now it does not seem to have any effect. Please prescribe for her.—Subscriber, Visalia.

She may have eaten something that has lodged in the stomach and will not pass. That sometimes causes such symptoms as you describe. Cows have a fashion of eating pieces of paper or cloth and often get nails or buttons into the stomach in that way. Once they are there they are slow in passing. Very little can be done in such cases but it is always safe to try a physic. You might try this: One ounce of aloin, three ounces of turpentine and one quart of raw linseed oil. Mix and divide into two doses. Give the two doses two or three days apart.

Enlarged Hind Leg

Please give treatment for a mare that has enlarged hind leg from hoof up to the hock. It is not an enlargement of the joint or bone and she is never lame. The beans (glands) on the inside of thigh are somewhat enlarged. It all seems to be gradually growing larger. Have owned her but a short time and am told that she was kicked on the stifle about three years ago and the swelling extended to the udder. She will soon bring a colt.—Subscriber, Fertilla.

Feed her lightly as heavy feeding will only aggravate it. Have druggist prepare these powders: Two ounces powdered gentian, two ounces powdered digitalis leaves, ten ounces nitrate of potash. Mix. Give tablespoon in the feed twice a day. Bathe swollen parts once a day with solution chloride of zinc, two ounces to the gallon of water. It will do more good if you warm the amount of solution that you use just before applying it. Warm it in an earthen or granite dish but not in tin.

Lumps in Cow's Udder

I have a cow that has been milking about eight months, and about two months ago I noticed a lump in her udder about an inch from the top and about the size of a bantam's egg. Now it is about the size of a large hen's egg. It moves readily and does not seem to hurt the cow upon pressure. Since discovering this two or three smaller ones have formed at the junction of the four quarters varying in size from a small pea to that of a marble. She is fed mostly on alfalfa and runs in a pasture of wild grasses. She seems perfectly healthy in other ways and is in good flesh for a grade Jersey. Is there anything that can be done for it?—Subscriber, Merced.

It is impossible to tell what is causing the tumors. They may be tuberculous or fibrous. Would advise having her tested for tuberculosis by the state. Notify the state veterinarian at Sacramento and ask to have her tested. If she proves to be free from tuberculosis then the tumors are probably fibrous and can be removed by splitting the skin, which can best be done when she is dry. In the meantime keep her in a healthy condition by giving her once a day a handful of salts containing two parts of epsom salt to one of common salt.

Worms in Dog

I have a good watch dog that at times gets sick and will not eat, but will lie around for two or three days. He is fed milk and scraps from the table. He used to be fat but for some time has been very thin in flesh. I am inclined to think that he has worms and would like to know what will destroy them. — Subscriber, Poway.

Worms would cause such symptoms as you describe. Try the following which is bad for the worms but will not hurt the dog: Have your druggist prepare ten powders each containing ten grains areca nut and ten tablets each containing five grains santonin. Give one powder every morning in a very little milk and one of the tablets of santonin every night by putting it down his throat. After this medicine is all used give him one dose of five grains of calomel.

A GREAT SALE

A three-day sale of pure bred cattle is a great event scheduled for the next week. It is that at the great Stanford Ranch at Vina. The Southern Pacific is offering excursion rates.

The dates of the sale are Tuesday, Wednesday and Thursday, June 5, 6 and 7.

From the time of its foundation in the early 80's by the late Governor Stanford, the herd of Holstein-Friesian pure breds on the Stanford Ranch at Vina has been steadily improved by the introduction of the best blood strains. What Governor Stanford did for the state in establishing this world-famous herd should prove to be a subject both enlightening and interesting.

M. H. Tichenor, who has been commissioned by the trustees of Leland Stanford Jr. University to dispose of the 300 pure bred Holsteins on the Stanford Ranch, has received many requests for permission to make selections from the herd prior to the sale, but those have all been rejected so that everyone will have an equal chance to secure the grand individuals at Vina for the improvement of their herds.

Owing to the great interest being manifested in the sale, it has been found necessary to arrange for special trains between Chico and Vina each day of the sale, thus making it possible to provide sufficient hotel accommodations.

Guaranteed

DEPENDABLE service is assured every purchaser of COMMERCIAL ENGINES. Their high quality and successful record through many years removes all risk. They are STANDARD and generally recognized as superior. Burning crude oil or gas, they are economical in operation; having few parts they are simple to operate. The quality of material is such that they last indefinitely under the hardest operation. Some of the first Commercials ever built are still in successful operation. Table Syrup from Sugar Beets

SUGAR beet syrup may be made by a very simple process, and a few rows in the garden will produce beets enough to give a family all the syrup needed. A bushel of beets will produce from three to five quarts of syrup. As the beets when mature should weigh from one to two pounds each 30 or 40 of them will make a bushel, and as the beets after thinning stand about ten inches apart in rows about 20 inches apart it is easy to determine how much ground to use for sugar beets if a particular quantity of syrup is desired. A few rows in the garden generally will be sufficient.

The beets should be topped by cutting off the crowns at the point of the lowest leaf scar, as the crown contains much of the salts taken up during growth. In making syrup the topped beets are cleaned by soaking a few minutes, then scrubbing with a coarse, stiff brush. The next step is to cut them into slices as thin as one-sixteenth of an inch if possible. A butcher knife may be used, but a kraut cutter or some other slicing device is easier.

The sliced beets are placed in a tight barrel and just enough hot water to cover them—boiling water if possible—is poured in at once. The barrel is then covered with several thicknesses of canvas to hold the heat. The sliced beets are allowed to soak for about 60 minutes. The barrel is agitated from time to time without being uncovered. This process brings out the sugar from the beets. The liquid is then drawn off, strained through several thickness of cheesecloth, and placed in a kettle or other vessel, in which it is boiled slowly until it has evaporated down to the thickness desired. It is important that the boiling be slow and the process will take several hours. The work may be done out doors if desired. Care should be taken not to scorch the syrup. The scum which rises to the surface of the liquid is skimmed off, to remove the strong, beetlike flavor.

The syrup is bottled or canned while hot and sealed to prevent molding. It is dark in color, but has a pleasant flavor.

Big Crop of Soy Beans Needed

Experiments have shown soy bean meal to have about the same feeding value as cottonseed meal; and cottonseed will probably be so high next fall that it cannot be afforded for feeding. There is sound reason then for anticipating a great demand on the crop for use as a feeding concentrate.

Because of the present shortage of fats and oils throughout the world, due to war consumption and low production in Europe, all available sources of these necessary materials will presently be utilized. Indeed soy bean seed is actually second only to cotton seed as a source of vegetable oils. It now seems certain that the demand for soy bean oil will soon become greater than can be supplied by the eastern crop.

During the war, when foodstuffs of all kinds will continually diminish, many unusual kinds of human food will be brought into use. The soy bean is one of the crops which will be utilized. Already several manufacturers in the East have successfully substituted soy beans for navy beans in the baked pork and beans. Indeed the demand in the East for soy beans for packing and planting has been so great since last fall that the cotton oil mills have practically ceased crushing the seed and are turning them to the planters and packers. One mill which last fall bought 10,000 bushels of seed and planned to crush at least 100,000 bushels did not crush any seed but disposed of the whole stock for food and planting. Only the yellow seeded varieties are used for food.

With the war-time demand on the soy bean crop for an animal concentrate, for human food, and for oil, in addition to the normal demand for forage and seed for planting, there is no doubt that high prices will be maintained. Soy beans are now selling at $3.50 to $4.00 a bushel—at double the usual price—and farmers should not fail to plant the largest possible acreage. It will be a profitable and patriotic enterprise.

Make Honey

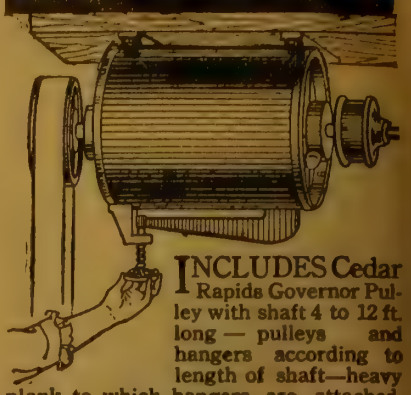
AS the United States is producing only a small portion of the sugar it requires the campaign is on to induce greater honey production to meet the need for more sweets. Gleanings in Bee Culture suggests that bees and boys make a good combination.

"Among the many efforts at conservation of resources induced by the war, the increase of honey production by amateur beekeepers should by no means be overlooked. It is said that honey is to some degree taking the place of sugar in England and that the Russian government is helping to introduce scientific beekeeping methods in Russia. Boys and girls in America are everywhere enlisting in an army of production to raise fruit, vegetables, and poultry and to help the farmers care for their crops. It is a most excellent movement, tending to health, wholesome interests, and practical efficiency, and no branch of husbandry is more likely to engage their enthusiasm than the care of bees.

"Many farms that have only two or three neglected old fashioned hives might produce honey in abundance if these were turned over to the son or daughter to be reorganized, and innumerable country and suburban places that have no bees should introduce them forthwith. It is not necessary that the owner should raise alsike or buckwheat. Bees range two or three miles from home, and in many places the roadsides alone furnish a vast amount of bee pasturage. With sugar at war prices, a few supers heavy with delicious home grown sweets will be welcome next fall.

"A boy of ten is old enough to be a valuable assistant in hiving the swarms and taking up the honey; and a year or two later he should be encouraged to invest in a hive, or be given a swarm of his own. His sister may do as well, or better, for many women succeed with this kind of 'live stock.' Beekeeping encourages self confidence, and stimulates habits of

Speed Governing Line Shaft



INCLUDES Cedar Rapids Governor Pulley with shaft 4 to 12 ft. long — pulleys and hangers according to length of shaft—heavy plank to which hangers are attached. Governor pulley prices

—as low as $12.00

Costs little more than the average friction clutch pulley. The governor with **a thousand different speeds**—controls any speed instantly. Regulates the speed of several pulleys on the same shaft—speed **regulated by a simple turn of the handwheel** on the governor and speed always uniformly maintained.

Install it yourself—with a screw driver. No service troubles—no figuring pulley sizes—attach it to the wall—the ceiling or the floor.

Ask Your Dealer About It

He'll gladly demonstrate it for you, show you how it will control your machinery and how easily it can be installed. Or write us for illustrated folder and prices of all sizes.

observation. It requires some pluck, deftness, intelligence, and watchfulness at certain seasons, but not that patience for monotonous labor that children have not. And bees are so amusing, and the hive is such a marvelous place! It does one good just to see the little ladies devoting themselves to the commonwealth; and a good treatise on apiculture, which is the prerequisite to beekeeping, is a capital introduction to biology and other sciences.

"As for the established beekeepers, if every one would start an enterprising boy or girl in business with one of his early swarms he would be doing his bit to make his own town more nearly self supporting. To increase our honey supply we need many enthusiastic amateurs. Backyard gardens should be supplemented by backyard beehives."

How to Kill the Flies

THE United States government makes the following suggestion for the destruction of house flies: Formaldehyde and sodium salicylate are the two best fly poisons. Both are superior to arsenic. They have their advantages for household use. They are not a poison to children; they are convenient to handle, their dilutions are simple and they attract the flies.

Preparation of Solutions

A formaldehyde solution of approximately the correct strength may be made by adding three teaspoons of the concentrated formaldehyde solution, commercially known as formalin, to a pint of water. Similarly, the proper concentration of sodium salicylate may be obtained by dissolving three teaspoons of the pure chemical (a powder) to a pint of water.

Containers for Solutions

An ordinary, thin-walled drinking glass is filled or partially filled with the solution. A saucer, or small plate, in which is placed a piece of white blotting paper cut the size of the dish, is put bottom up over the glass. The whole is then quickly inverted, a match placed under the edge of the glass, and the container is ready for use. As the solution dries out of the saucer the liquid seal at the edge of the glass is broken and more liquid flows into the lower receptacle. Thus the paper is always kept moist.

Other Simple Preventives

Any odor pleasing to man is offensive to the fly and vice versa, and will drive them away.

Take five cents' worth of oil of lavender, mix it with the same quantity of water, put it in a common glass atomizer and spray it around the rooms where flies are. In the dining room spray it lavishly even on the table linen. The odor is very disagreeable to flies but refreshing to most people.

Geranium, mignonette, heliotrope and white clover are offensive to flies. They especially dislike the odor of honeysuckle and hop blossoms.

According to a French scientist flies have intense hatred for the color blue. Rooms decorated in blue will help to keep out the flies.

Mix together one tablespoon of cream, one of ground black pepper and one of brown sugar. This mixture is poisonous to flies. Put in a saucer, darken the room except one window and in that set the saucer.

To clear the house of flies, burn pyrethrum powder. This stupefies the flies, but they must be swept up and burned.

For Stables and Out-of-Doors

Borax is especially valuable around farms and out of doors. One pound of borax to 12 bushels of manure will be found desirable as a poison without injuring its manurial qualities or farm stock. Scatter the borax over the manure and sprinkle with water.

Lye, chloride of lime, or copperas (sulphate of iron) dissolved in water, crude carbolic acid, or any kind of disinfectant may be used in vaults.

THE MOTOR TRUCK

In these days when the operation of a farm is becoming more and more scientific, that is, accurate thinking and calculation is taking the place of habit or guessing, much interest is growing in the motor truck.

Many instances have come to our notice where motor trucks alone, or with trailers, are earning big money in farming operations, and we expect to see a rapid growth in their use as soon as the truck concerns have more time to place the advantages before those interested.

In the meantime we suggest that our people begin to do some calculating on the subject, and write some of the reliable truck concerns for information.

TAKE CARE OF YOUR TRACTOR

"A stitch in time saves nine." This is a trite old saying and you will find that this will apply to successful upkeep and operation of your tractor. Carelessness and inattention to the working parts of your motor or other parts of your tractor will result in breakage that will cost you nine dollars and then some if you do not give them proper attention at the right time. Especially is it true about giving your motor bearings prompt and careful attention in time and seeing that your engine is properly lubricated.

COST OF ALFALFA PRODUCTION

Various items which enter into the cost of alfalfa production in the Imperial Valley are given by a practical farmer growing this crop: District and county taxes, $4.00; water assessment, $2.00; irrigating, including labor at $2.50 and certificate, or fees, $2.50; upkeep of ranch ditches connecting with the company ditch, $1.50; total of $12.50 annual per acre cost.

Tonnage per acre varies greatly because of differences in soil and condition of the alfalfa. There is also variation because many farmers make only three or four cuttings per year, then pasture.

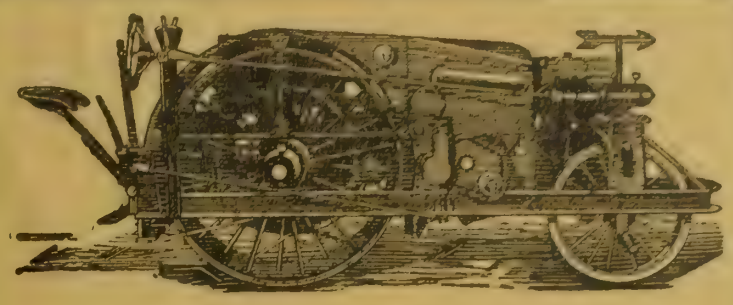
KILLING OUT MUSTARD

So successful were the sulphate of iron experiments for the eradication of wild mustard in Yolo County that a number of farmers have agreed to use this method for the same purpose to a great extent next year. Experiments under the jurisdiction of experts from State Horticultural Commissioner Hecke's office have been conducted near Davis this season.

Two experiments were made; one field containing four acres, was well advanced in growth, but 75 per cent of the mustard was destroyed with no injury to the grain. Another experiment of one acre, with an unusual infestation, was sprayed with 100 pounds of iron sulphate, resulting in more than 90 per cent of mustard being destroyed, and no injury to the tender grain plants.

Clean grain and hay will more than bear the expense of spraying and the mustard will be controlled. County Horticultural Commissioner Gould, who assisted in the experiments, says that their success has been greater than was expected.

CASE



"Better Be Safe Than Sorry"

When buying power farming machinery, take no risk. —Invest your money safely—*Buy Case Machinery.*

When you select a Case Tractor or Thresher you are buying a product that is built honestly and carefully —a product that is built to uphold a name, one that is built *right;* that is neither too small, too light, nor too cheap. You are buying a product that is the choice of all thinking and studious farmers.

The Case 10-20 Tractor, like all other Case Tractors, holds top place in the Tractor field. Its motor is especially Case designed and Case made. The Case 10-20 is simple, efficient, economical and noted for its constant responsive power. It is adapted to all farm work—drives a 20x36 Case separator or hay baler, hauls, operates a silo filler, etc., etc.

A Case 10-20 Tractor with a Case 20x36-inch Thresher forms an ideal combination. The all-steel construction of Case Threshers that make them fire, wind and water-proof; the ease of operation, the strength of the cylinders that enables them to handle damp and tough grain, together with the fact that Case Threshers get the greatest amount of grain out of the crops, have made farmers who seek *capacity, durability* and *easy running qualities*, prefer them to all others.

Case builds five sizes of tractors and seven sizes of threshers.

There is a combination suitable for every size farm.

Their efficiency and simplicity make it desirable for every farmer to own a threshing outfit.

Write *today* for our new catalog.

We think it is the finest yet produced in the agricultural world.

No farmer can afford to be without it.

It will be sent you on request, absolutely *free.*

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

We wish there were no corner in California which looked any less prosperous than the first cover page of this week's issue. "Hog and Hominy" is its title, and it looks the prosperity which it means to this state. Let us grow more of both.

DOING ITS BIT

The agricultural college of the state of Washington had planned this year the spending of $114,000 in completing two new buildings on the campus at Pullman. But the institution heard the cry for more bread, postponed this work and will devote the entire $114,000 to doing its bit in the nation-wide agricultural preparedness campaign. The money will be used to increase the efficiency of the experiment stations at Pullman and Puyallup in mobilizing and perfecting agriculture.

PROUD OF OUR HOMEMAKERS

Speaking of efficiency, economy, producing more, saving more, and a thousand and one other things inspired by war conditions, have you noticed the household department of the California Cultivator during the past few weeks? As one of our readers has said:

"It makes me proud to be a woman—and a California woman—to read the articles in this week's household department of the California Cultivator."

And more articles as good are coming. They are already in type and waiting for space in these columns.

Our women have business heads as well as the desire to accomplish. And they can write too. Did you ever read anything more fascinating than these three pages of the California Cultivator?

Notice the offers for "Next Household Contest".

MORE CONFIDENCE

Some weeks ago in appealing for greater production and the need of patriotism in the matter of farming, the Cultivator suggested producing to the limit and urged that there was no danger of overdoing it. We often hear even yet—when the correctness of the Cultivator's prediction is clearly shown—the farmer remark that he would produce more if he were sure of selling at reasonable prices. It is possible that for such farmers the "maximum and minimum" would give assurance of fair returns. We trust such a measure may not be necessary and that producers will have sufficient confidence in satisfactory marketing conditions to produce to the limit. More confidence, more hard work, more implements, more efficiency, is all that will save many from going hungry. Profits will be according to this efficiency and to work and fertility put into the soil.

VOLUNTEER

Conscription will take many an American boy into European trenches, and he will honor his family and his country. Many of us at home will have some of our wages and our income conscripted in the form of taxes, but there is one form of volunteer service possible to nearly all of us.

Buy Liberty Bond.

It's within the reach of nearly all of us for they may be had in denominations as low as $50 and on partial payments.

It has been said of the mother who "didn't raise her boy to be a soldier" that while that is probably true, it is also true that she is living in a free land and enjoying a liberty which was purchased by some other mother who did raise her boy to be a patriot and if necessary to give of his best to his country and with Father Abraham or with Washington at Valley Forge he aided in preserving our liberties.

Our boys are doing their share. How about the rest of us?

It is better to volunteer in the Liberty Loan campaign than to be conscripted in a huge German Indemnity campaign a year or two later. The indifference or smug feeling of security in most Americans is astounding. Our work has been cut out for us. We are in this war to stay or to pay handsomely for our indifference.

Wake up and buy a Liberty Bond.

If you can't carry a gun, or buy a bond, grow a potato or a bean.

PROTECTION OF ORANGES

There are many ways of securing "Protection". In our war taxes, however, there does not seem to be much "free trade" left, and we realize that congress has some problem in distributing war burdens. But the California orange grower—and we may also add the grower of nuts, raisins, prunes, peaches, in fact, every other product—asks why should the accident of greater distance and heavier freight bills be used as a basis for putting a heavier tax on California grown oranges and other products than is to be put on those same products in other parts of the country? If the provision that a certain percentage of all freight bills shall be put into the war fund passes it means that California citrus fruits will pay more than two or three times as much as the same number of Florida citrus fruits.

If a tax is to be put upon the products of the soil, let it be evenly distributed. The tax mentioned is only a small indication of the burden which will be placed upon the Pacific coast if this matter of percentage of freight bills should prevail. No section of the United States sends its products to such distances and pays such freight bills as does the Pacific coast.

All the congressmen from the West should unite in securing justice. Pacific coast producers are no slackers; they will do their share, but they are quick to see the injustice of any such provision.

FOOD SUPPLY

The commission on resources and food supply of the California council of defense reports that its hearings in 57 counties of California have shown that never before has so much capital or labor been expended in the production of farm crops in California as this year. Notwithstanding this, because of deficient rainfall, cold weather and other factors the total crop yield will be below normal.

Unfortunately this is only an indication of what is occurring all over the world. Other sections of the United States report continued cold, wet weather, and now comes the cyclone in Illinois and other sections of the Middle West and destroys millions in crops.

The international institute of agriculture at Rome reports:

"The weather which has prevailed over the whole of Europe for several months has been almost everywhere unfavorable for the crops, and many farmers have been prevented by the adverse conditions from making progress with their plowing and spring sowing. Generally speaking vegetation is very backward, but in most places a spell of fine weather would set matters nearly right. The recent heavy rains have resulted in floods in certain localities and favored the development of cryptogamic diseases and have therefore been adverse to cultivation."

AT PALO ALTO

On the cover of the issue of May 19 we gave colored illustration of the magnificent dairy barns of the Stanford Ranch at Palo Alto. The group of pure bred Holsteins are owned by the same ranch and are under the management of H. H. Tichenor. We referred to this ranch as being near Mayfield. We should have said Palo Alto, for the place is a part of the great Stanford Estate. Description of this farm was given in an issue of the Cultivator some months ago and the beautiful colored illustration on cover page of the Cultivator of May 19 is proof of the statement then made: "Every requirement of the strict dairy law has been complied with. White-suited attendants add to the pleasing appearance and sanitation of the place."

We appreciate the courtesy of Mr. Tichenor and his helpers in permitting the use of that fine illustration.

Be Thrifty! Be Patriotic!
Buy a Liberty Bond!

Agricultural Notes

California has this year 5100 acres planted to strawberries which are expected to yield 510,000 crates.

The United States since the outbreak of the war has become the chief source of imports into Bolivia.

Bosnia, before the war, produced annually 4000 carloads of prunes. Serbia was a still heavier producer of this fruit.

Garbanzos, or chick peas, are a very popular food in Spain, the greater part of the supply being imported from Mexico.

The Missouri strawberry crop was badly damaged by the frost of May 8. This state has an acreage in strawberries of 6950.

The government of Ontario, Canada, is placing 35 tractors through the country for the use of farmers at a nominal charge.

Florida tomato growers have presented a formal petition of protest in the United States senate against the newly prescribed tomato basket.

Exports of the United States for March, 1917, amounted in value to $553,988,239. Imports during same month amounted to $270,218,139.

The director of the census estimates that on July 1 California will have 362,000 young men between the ages of 21 and 30, eligible for registry.

Hawaii's sugar no longer goes to the Eastern refineries by way of Panama Canal, but is sent across the continent by rail from Pacific Coast points.

Official grades have been established by the Canadian government for grain, apples and peaches. There is a growing demand for the application of official grades to other products.

Because of shortage of labor greatly increased use has been made of dynamite in road building the past year. The road builders follow the practice of drainage engineers and blast trenches ahead of the grading, not only to assist in the latter work but also to drain the land before the machines arrive to shape the road.

Hawaii, with its thousands of rice eating laborers, has been seriously affected by the jump in war prices and efforts to corner the available supply of this cereal on the islands. Shipments from California have given temporary relief. Anticipation of the government's demands on shipping have hastened the movement to make the island as nearly as possible self supporting in food production.

Material from the New York subway excavations may be utilized in the construction of artificial fishing banks a few miles off the coast of Long Island. It is proposed to dump material in a stratum one or two feet deep on the sandy bottom and thus establish an artificial bank, which will offer no obstruction to navigation but will provide a rock or gravel area suitable for the development of marine growths.

Notwithstanding increased planting of orchards the fruit crop in New Zealand this season falls short of demand save as to some varieties of apples. Stone fruits are very scarce and expensive, and apples are now quoted at wholesale at $3.05 per bushel. This shortage of fruit is the result of late frosts in certain sections and exceedingly damp and cool weather in others, which have made it difficult to spray trees to control the insects and diseases.

Agricultural News Notes of the Pacific Coast

Northern California

Santa Rosa held a very successful rose carnival May 11-13.

J. C. Smith of Vacaville shipped a crate of apricots on May 8.

Butte County reports a most successful spring exposition just closed.

The California Almond Growers' Exchange has contracted to build a warehouse in Sacramento.

Growers of green peas in Alameda County are urged to unite to secure better prices for their product.

A wool buyer now in the Corning district of Tehama County is paying 50 and 51 cents for best grade wool.

The fish and game commission has increased the bounty on mountain lions to $30 for females and $20 for males.

Eight thousand acres of corn, double the acreage of last year, are reported being planted in San Joaquin Valley.

The Sierra Valley in Sierra County has recently had installed a cheese factory for the making of "jack" cheese.

The first carload of cherries from Placer County went forward on May 17. The season this year is somewhat later than last.

Hop growers generally are looking around to find what crop they can put in to bring a little more profit than hops now promise.

The suit of the Sutter-Butte Canal Company against the American Rice & Alfalfa Company has been decided in favor of the plaintiff.

As a means of combating the beef shortage plans are under way for increasing the number of cattle in the Eldorado national forest.

Dairymen of the Eel River Valley in Humboldt County on May 15 received 44½ cents for butter fat, as against 39½ on the same date last year.

It is estimated that 500 tons of blackfish and carp were left stranded by the pumping out of the water from the Tule Lake bean fields in Lake County.

United States soldiers are stationed at the headgates of the Sutter-Butte canal to insure the safety of the crops in that section, aggregating in value $4,000,000.

An increase of 1000 head of cattle on the Eldorado national forest was the subject of discussion at the last meeting of the Eldorado-Amador Live Stock Association.

The movement on the part of the hop growers of the state to form a cooperative marketing association has failed because not enough growers could be found to sign up 50,000 bales.

Grazing privileges will this year be allowed in Yosemite National Park. It is stated the department of the interior will this year open every available acre to stockmen for grazing purposes.

Sutter County is to have a steam raisin evaporator which will handle the fruit without risk of spoiling because of early rains. The artificial dryer is said to cure the fruit in from 24 to 48 hours.

To save their crops farmers have taken possession of the entire system of the Gridley Land and Irrigation Company. The controversy between water users and the water company is to be adjudicated by the state railroad commission June 5.

Central California

Aromas, San Benito County, has a big apricot crop in prospect.

Over 298,000 acres of land are included in the proposed Kaweah Basin irrigation district.

Oakdale, Stanislaus County, reports between 2000 and 3000 acres of beans planted in that district.

Merced County has a new farm adviser. J. F. Grass was appointed to the position and took over the duties of his office May 17.

The Tulare County Canning Peach Growers' Association has decided not to fix prices this season but allow packers to make them, selling the entire crop to the highest bidder.

W. S. Shippey, for seven years manager of the Stewart Fruit Company at Porterville, will take charge of the packing houses of the California Fruit Growers' Exchange in the Porterville district.

The Pomona Grange of Santa Clara County has adopted a definite plan of roadside beautification. The weeds along highways will be cut, the ground plowed and put in readiness for planting in the fall.

County Live Stock Inspector Griffith of Kings County in his April report states that the county is almost entirely free of animal disease. He says this is due to the careful cooperative sanitary work of stockmen.

Southern California

Work has begun on the erection of the Heuneme Cannery.

Cherries lead in this year's orchard planting at Beaumont.

The "Preparedness" demonstration train is now at Los Angeles.

Santa Barbara County has more than doubled its acreage planted to potatoes this season.

The cannery of the Hemet-San Jacinto Growers' Association is almost ready for the packing season.

The George Jr. Republic has been holding a number of meetings at Chino in cooperation with ranchers of the valley.

The Beaumont Fruit Growers' Association last year handled 105 tons of pears, 60 tons of peaches and 8500 boxes of apples, among other fruits.

The lemon industry in all its phases is to be depicted on motion picture films, the films being taken in the Limoneira Orchards at Santa Paula, Ventura County.

In addition to the lady birds secured from the state horticultural commission Ventura County has secured a big colony from Sespe Canyon through the efforts of Inspector Wiklund.

The San Antonio Growers' Association recently held its annual meeting at Ontario, at which time President Benton Ballou and Secretary-Treasurer J. H. Williams were re-elected. The association controls 2300 acres.

The Coast

Chandler, Arizona, will have a new cheese factory ready for business in a few weeks.

Five thousand sacks of peppermint roots have been shipped from Clatskanie, Oregon.

It is hoped to have 10,000 acres of land near Eugene, Oregon, planted to beans this year.

Five garden and canning clubs have been organized among young people of Clallam County, Washington.

J. Martin of Maupin, Oregon, last week shipped a carload of hogs to the Portland market, receiving check for $3700.

Colorado had 38,000 acres in beans last year. Mexican or Idaho Pinto beans are the most important varieties raised.

It is estimated that 1000 acres in Skagit County, Washington, are devoted to the growing of cabbage and spinach seed.

Much of the apple crop of the Northwest will be marketed unwrapped this year because of the high price of paper.

From Boise, Idaho, comes estimate of the coming crop of Italian prunes at 3000 cars. Apples are expected to make 7000 cars.

The first month's work of the Linn County Cow Testing Association shows 14 cows producing over 45 pounds of butter fat.

Grays Harbor County is so well pleased with its county adviser that it has supplied him with a new automobile and increased salary.

Fruit inspectors of Hood River Valley have issued warning that all prunings from fruit trees must be burned within 30 days after removal from the trees.

Schools of Portland, Oregon, are planning to give instructions in home canning in the domestic science rooms of the school throughout the summer.

The live stock sanitary board of Idaho will cooperate with the federal government in testing cattle for tuberculosis and in treating for eradication of hog cholera.

The chamber of commerce of Montesano, Washington, is listing all able-bodied men and boys, including business men, who will be able to help the farmers in emergency.

Representatives of the Northwestern Fruit Exchange are in Washington to present protests to the interstate commerce commission against the proposed raise in freight rates.

A Washington apple grower who had several boxes of Winesaps caught by the freeze last fall put them away in a cold cellar, and opening them up May 3 found them first class cold storage goods.

A number of fruit and vegetable growers' cooperative associations of Washington have banded together under the name of Associated Fruit and Vegetable Growers, with headquarters at Walla Walla.

Five land bank appraisers for the Spokane farm loan bank have been appointed by the national board at Washington. They are: for Washington, C. B. Kegley, master of the state grange, and A. D. Davison, of Stevenson; Montana, W. D. Graves of Missoula and T. S. Hogan of Billings; Idaho, C. E. B. Roberts.

Register!

June 5 is Registration Day

The President Proclaims:

Now, therefore, I Woodrow Wilson, president of the United States, do call upon the governor of each of the several states and territories, the board of commissioners of the District of Columbia, and all officers and agents of the several states and territories, of the District of Columbia, and of the counties and municipalities therein to perform certain duties in the execution of the foregoing law, which duties will be communicated to them directly in regulations of even date herewith.

And I do further proclaim and give notice to all persons subject to registration in the several states and in the District of Columbia in accordance with the above law that the time and place of such registration shall be between 7 a. m. and 9 p. m. on the fifth day of June, 1917, at the registration place in the precinct wherein they have their permanent homes. Those who shall have attained their 21st birthday and who shall not have attained their 31st birthday on or before the day here named are required to register, excepting only officers and enlisted men of the regular army, the navy, the marine corps, and the national guard and naval militia while in the service of the United States, and officers in the officers' reserve corps and enlisted men in the enlisted reserve corps while in active service. In the territories of Alaska, Hawaii and Porto Rico a day for registration will be named in a later proclamation.

And I do charge those who through sickness shall be unable to present themselves for registration that they apply on or before the day of registration to the county clerk of the county where they may be for instructions as to how they may be registered by agent. Those who expect to be absent on the day named from the counties in which they have their permanent homes may register by mail, but their mailed registration cards must reach the places in which they have their permanent homes by the day named herein. They should apply as soon as practicable to the county clerk of the county wherein they may be for instructions as to how they may accomplish their registration by mail. In case such persons as, through sickness or absence, may be unable to present themselves personally for registration shall be sojourning in cities of over 30,000 population, they shall apply to the city clerk of the city wherein they may be sojourning rather than to the clerk of the county. The clerks of counties and of cities of over 30,000 population in which numerous applications from the sick and from nonresidents are expected are authorized to establish such subagencies and to employ and deputize such clerical force as may be necessary to accommodate these applications.

Complete Dispersal

OF THE

"Pinehurst Dairy" Holsteins of Sheboygan Falls, Wis.

Peter Reiss, Owner

AT

Lake Mills, Wis. June 12

95 Head of Extra Choice Holsteins and One of the Best Herds of Wisconsin. Tested by the State and On the ACCREDITED LIST.

50 fine large cows, 44 of which have Official Records, among them Pinehurst Piebe No. 133468, with 34.43 lbs.

13 cows with yearly records, four of whom have over 800 lbs. for the year.

30 daughters of Piebe Champion. All A.R.O. except one; 5 daughters of Sir Piebe Johanna Sarcastic, A.R.O. and averaging 25.28 lbs.; 33 daughters of King Segis Concordia Hengerveld, senior herd sire, whose two nearest dams average 32.83 lbs; 9 daughters and 8 sons of King Korndyke Akkrummer Ormsby, junior herd sire, a 31.11-lb. grandson of Hengerveld De Kol. Most of the cows in calf to those two good herd sires.

Santa Anita Rancho
Anoakia Breeding Farm

ARABIAN-THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three-year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars, Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY
YOUR COWS MADE PROMPT. REGULAR BREEDERS BY
STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. Price $1.00. Mail postpaid, in plain wrapper.

The Butte County Spring Exposition

Written for California Cultivator By W. S. Guilford

ANOTHER great fair record was made at the Butte County Spring Exposition, held last week at Chico.

This is the third annual event held under the auspices of the Chico Business Men's Association, and each one has been far greater than the preceding, not only in number and excellence of exhibits, but in attendance.

There was a big industrial and machinery display—and the best district show of live stock held in the West.

Great credit is due to the businessmen and citizens of Chico and vicinity, and particularly to Secretary E. J. Falk, Director General A. G. Eames and J. H. Guill Jr., superintendent of live stock. These men know how to make a big successful fair. When every one connected with the enterprise does everything in his or her power to make exhibitors and visitors contented and happy there can be but one result, a wonderful success, and this is just what happened at Chico.

In the live stock division there were exhibited 10 horses, 10 ponies, 115 cattle, 34 sheep and 157 hogs, a grand total of 326 head.

Easton & Ward of Diablo won all draft horse prizes on their wonderful collection of Shire horses.

The Shetland and Welsh ponies from Butte City Ranch, shown by three-year-old Tom Dwyer and six-year-old Billy Dwyer, made one of the big attractions of the show. These boys won six fine silver trophies with their ponies.

In the Shorthorn classes five splendid herds were represented: Jess Bennett of Chico; H. L. and E. H. Murphy and G. A. Murphy of Perkins; Alexander & Kellogg from Suisun; and Butte City Ranch of Butte City.

In beef Shorthorn classes Jess Bennett won both championships; Alexander & Kellogg winning championships on dairy Shorthorns.

There was keen competition in many of the classes and each herd won several first prizes. Twenty-four out of 40 animals shown were owned or had been sold by Murphy Brothers. The Shorthorn Association trophy was won by Jess Bennett.

In the Holstein show the following breeders were represented: A. W. Morris & Sons, who won the Holstein Association trophy; Bridgford Company of Knightsen; Henderson Company of Sacramento, and the Vina Ranch. Prizes were well distributed.

Jerseys were shown by McLaith & Dado, S. F. Williams and Gurnett and Myhre of Orland; Chas. L. Leonard of Jacinto; Brooks Brothers and Orville Canfield of Chico. McLaith & Dado had grand champion bull and cow.

In the sheep classes Butte City Ranch won all prizes on registered Shropshires.

Duroc-Jersey hogs were shown by H. P. Slocum & Sons, Willows; Hayden Smith of Woodland; Maurice Rucker of Fair Oaks; Lloyd Costar, W. V. Bennett, Rohlstadt Brothers and C. Van Orsdel of Chico. Uneeda Wonder, owned by Slocum & Smith, was champion boar; Model Lady, owned by Slocum, was champion sow. The Duroc show was very strong and the classes closely contested.

Poland-Chinas were shown by O. C. Pratt, Van Shorack & Sons of Chico; J. R. Cook of Paradise, and S. F. Williams of Orland. Cook won both championships.

All Hampshire swine prizes went to H. E. Richardson of Chico and all Chester-White awards to Harry Huffman, Chico.

There was very keen competition in the Berkshire classes. In the aged boar class Frank Brush showed Ames Rival 102nd, a first prize winner at the Panama-Pacific Exposition; Butte City Ranch showed Iowana Champion Peer 2d and James Mills Orchards showed Ames Rival 70th. Ames Rival 70th was in the highest flesh and won first in class and championship. Iowana Champion Peer was second. Butte City Ranch had first prize senior yearling sow and grand champion of the show on Escalon Fashion Princess.

F. A. Brush won both championships for hogs bred by exhibitor and the fine silver trophy for the best herd bred and shown by exhibitor.

A diploma for the best and largest exhibit of live stock in the show was awarded to Butte City Ranch.

Silage for Horses

By E. H. Hughes, Missouri Agricultural Experiment Station

IN planting corn and building silos probably more farmers than ever before are providing a silage supply for horses. The old feeling that silage was good for dairy cows only was long discarded, but the horse is perhaps the last more important animal on the farm to prove that it could make good use of silage. While especial care must be taken not to use moldy or other inferior silage or to depend too exclusively on silage, the recent tests and long experience of farmers and horsemen indicate that cost of upkeep can be reduced and a horse kept in better condition if from five to 25 pounds of silage are fed per day. Of course, the possibility of saving depends on the conditions and prices of other feeds and the amount to be fed depends upon the same things and upon the size of the horse and the amount of silage he will eat. Different horses of the same size vary on this point.

In the tests at the Missouri experiment station silage was fed as part of the ration during the last two winters with favorable results, except in case of one three-year-old Percheron mare which refused the silage at first, then ate it when her feed was reduced, but soon after had to be taken out of the experiment because of distemper and indigestion. The horses that received silage were more thrifty, and their coats were in better condition, and they cost less to feed than those which were fed exclusively non-silage rations.

One of the breeders has been feeding silage to about 100 draft horses for 25 years without any sickness which he thinks could be directly charged to silage. During the breeding season he feeds silage to mares as usual but gives none to the stallion because he had difficulty in getting the mares in foal when the stal-

When writing advertisers, mention the Cultivator.

lion was fed on silage. At other times he feeds eight pounds of silage at each of the three feeds per day to his aged stallions in addition to some hay and grain. His two-year-old stallions get 20 pounds of silage a day and the yearlings about 15 pounds in addition to some hay and grain, while the mares with foals at side receive 20 pounds. At weaning time this amount is divided and about 15 pounds is given to the mare and five pounds to the colt, which is given more as it grows and becomes accustomed to this feed, until at a year old he is getting 15 pounds of silage a day.

One importing firm has fed silage for five years following about the methods just outlined and reports excellent results and a reduction in the need for veterinary services.

Some of the horsemen who have fed inferior silage have not had such uniformly good results, but it is a poor plan to give a horse moldy or rotten food of any kind. Silage that has been frozen or that was made from immature corn is regarded with suspicion. Some owners have thought that their horses had died as a result of being fed such silage, and while the station has not been able to learn definitely that silage was the cause of death in these cases or find out exactly how the supposed poison acted, it is well to take every precaution.

As silage is low in dry matter and the horse has not sufficient digestive capacity to live entirely on such bulky feed, it is important to remember to use alfalfa, cowpeas, or other legume hay, or perhaps even a little grain for horses that are not at work, while growing horses or horses at light work should certainly have grain.

Dehorning Milch Goats

MANY inquiries that come to me about the care of goats request how to determine whether or not a kid is horned, and, if horned, how and when is best to dehorn. If a kid is born naturally hornless, the hair on its head grows smoothly, but if horned, little curls may be noticed where the horn-buds are located.

The proper time to dehorn is when a kid is about 24 hours old. After a week old it is almost always useless to attempt dehorning. First cut away the hair close to the head around the horn-buds. Next make a circle of grease around, but not touching the horns. This grease is to prevent the caustic from running down the head and burning other parts than the horn-buds. The greatest care must be used in applying caustic. I have known of cases where a goat's eyes were ruined for life by the caustic having been applied too freely so that it ran down the side of the head. In making the circles of grease see that none touches where caustic should be applied as it neutralizes the action of the caustic. Have ready a stick of caustic of good strength in a shallow bottle, into which drop a few drops of water. Make a small swab by winding white cotton string around the end of a short stick about half the diameter of a lead pencil. Have someone hold the kid while caustic is applied, as it will struggle vigorously. When all is ready, hold a cloth tightly over the kid's eyes, dip swab in bottle and moisten only slightly with the diluted caustic, then rub a circle directly around and over each horn-bud, using considerable pressure on swab. The swab should be dipped repeatedly in caustic and rubbed many times over each horn-bud until the skin is loosened and horn-bud destroyed. Remember to use only a little caustic each dipping of swab, because if too much is used there is great danger of it running and burning seriously where not intended.

Too great stress cannot be laid on the care needed to avoid serious injury to kid in this operation. Hold kid some 15 or 20 minutes after application to prevent scratching caustic into its eyes.

Repeat operation next day and, if considered necessary, on third day, but usually two thorough applications completely destroy the life of the horn cells and the operation is perfectly successful, the goat growing to maturity with no sign of horns. As a rule a naturally hornless goat has at maturity well developed knobs where the horns would be, whereas a dehorned goat does not show these knobs. Once again let me urge the greatest care in applying caustic, for if not properly handled it may be a most cruel operation. Be sure the caustic is of good strength and keep in tightly corked bottle when not in use, as contact with air soon weakens its potency.—Winthrop Howland in Milch Goat Bulletin.

Lice on Hogs

"How May Hogs Be Rid of Lice?—This question is answered by Field Secretary R. L. Hill of the National Duroc-Jersey Record Association. He says:

"During warm weather the animals may be dipped or sprayed with two per cent solution of some commercial preparation such as Liquor-Cresolis, Compound, Creolin, Kreso. Three ounces to one gallon makes about a two per cent solution.

"An emulsion dip may be prepared as follows: Kerosene oil two gallons, soap eight ounces, water one gallon.

"Make the water hot to dissolve the soap and while it is hot add to the kerosene, stirring the mixture rapidly for ten minutes. One gallon of this mixture is then mixed with nine gallons of water. The preparation may be used in a dipping tank or may be sprinkled over the hogs with a spray pump. The dip should be used toward evening or on cloudy day as the hot sun may blister the animal's skin if the oil has not evaporated.

"The emulsion dip is probably more efficient in destroying the nits than the commercial dip. In either case the treatment should be repeated in a week or ten days to destroy any lice which may have hatched since the previous treatment.

"During cool weather, sprinkling the hogs with crude oil is very effective. If this is used in summer, the hogs may blister if turned out in the hot sun.

"After treating hogs for either worms or lice the yards should be cleaned of litter and sprinkled liberally with freshly slacked lime to prevent reinfection of the herd. Lime kills many worm eggs and embryo worms in the infested grounds."

New York has 1,826,000 acres in state forests, more than any other state in the union.

THE BEST LINIMENT

OR PAIN KILLER FOR THE HUMAN BODY

Gombault's Caustic Balsam

IT HAS NO EQUAL

For the Human Body

A Perfectly Safe and Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Strains, Lumbago, Diphtheria, Sore Lungs, Rheumatism and all Stiff Joints

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

REMOVES THE SORENESS--STRENGTHENS MUSCLES

CUTTER'S BLACKLEG PILLS

"California's Favorite" for nearly 20 years

For the Prevention of Blackleg in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest.

Prices:

10 dose pkge. Single pills	$1.00
50 dose pkge. Single pills	4.00
10 dose pkge. Double Pills	1.50
50 dose pkge. Double Pills	6.00
Cutter's Pill Injector....	1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

1501-3-5 So. Main St., Los Angeles, Cal.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

AT FARROWING TIME

A sow should be placed by herself not later than two weeks before farrowing. Always provide a nice, warm, sanitary, quiet, convenient, individual pen for her, where she will receive proper attention, and the pigs can be saved.

Keep the floor and bedding dry and free of dust. It is positively necessary to construct farrowing houses that can be sprayed, scrubbed and disinfected. Have plenty of sunlight—pigs enjoy it and it kills the germs. Her feed should be gradually decreased to the farrowing date and she should receive nothing to eat till about 24 hours after farrowing.

Hanford creameries paid $225,000 for butterfat during April.

Big Cows in State Dairy Cow Competition

A COW that produces six times as much butter fat in a month as the average for all the dairy cows of California won last month's honors in the state dairy cow competition being conducted by the University of California college of agriculture. She was "Imported President Doris of Lewison," owned by the Palo Alto Stock Farm.

How extravagantly inefficient the ordinary dairy cow is, as compared with what she ought to be, is shown by the fact that the 812 cows entered up to May 1, when the list closed in this ten-months competition, averaged last month a production of 55.3 pounds of butter fat, or nearly four times the average for the dairy cows of California as a whole, which is 15 pounds of butter fat a month. It costs little more to feed a good cow than a poor cow. The university is aiding the farmers of the state to get rid of "boarder cows" which do not produce enough milk to pay for their feed by urging the dairymen to form cooperative cow testing associations and by providing official testing for dairy cows for owners who wish to obtain Advance Registry records.

With this year's shortage of feed it is doubly important that every dairyman should have in his herd only cows that are worth their keep.

The average for the month for the cows in the university's competition was 1347 pounds of milk, or, at 16 cents a gallon, $25; or, with butter fat at 40 cents a pound, $22.12 plus $2.50 for a thousand pounds of skim milk.

The reason these cows gave about four times as much as the average California dairy cow is that they were bred right, fed right, and handled right. Most of them are pure-bred, of one or the other dairy breeds. However, while it was a pure bred Guernsey that made the best record for the month—96 pounds of butter fat—a grade Holstein produced 93 pounds, a grade Jersey nearly 92 pounds, and four other grade cows produced over 82 pounds of butter fat.

A Humboldt County farmer, G. E. Trigg of Ferndale, won the Pacific Rural Press prize for the highest production by five grade cows during April, with an average production of over 82 pounds of butter fat.

F. Stenzel of San Lorenzo won the McAlister & Sons prize for April for the highest production by a grade cow—93 pounds.

In spite of the present high prices of feed, cows such as the 812 in this competition are large money makers. The first step for the farmer to take to build up a herd of such animals is to find out whether each of his cows earns her own board and to get rid of a cow if she does not. Heredity must be studied, and calves raised from parents of generous milk producing quality.

Great Producers

HOLSTEINS are making some wonderful records. Now comes a mere heifer (under three years old) with over 40 pounds of butter in a week. She is Glen Alex Queen De Kol 275362, the youngest cow in the world to make over 40 pounds of butter in a 7-day official test. Her record of 42.36 pounds surpasses the former champion in that class by 10.76 pounds! She is the first 40-pound daughter of a 40-pound cow, her dam being the former nine-year-old champion, Tietje Queen De Kol, whose record of 42.26 pounds was made in December last. Since then Tietje Queen De Kol has been sold for $5000.

Glen Alex Queen De Kol is the 21st 40-pound Holstein cow. At two years and 14 days she made 23.19 pounds of butter from 369 pounds of milk. Her next freshening occurred at two years 11 months and 20 days and was followed by the production of 42.36 pounds of butter from 603.8 pounds of milk in seven days. She is a daughter of Sir Pontiac Korndyke 6th 66229 and her dam has another daughter, a full sister to the new champion, with a 31-pound record made as a three-year-old.

During the test Glen Alex Queen De Kol ate about 22 pounds per day of the following grain ration: 50 pounds distillers' grain; 50 pounds bran; 30 pounds ground oats; 30 pounds gluten; 20 pounds oil meal; 4 pounds salt; and two pounds charcoal. A small quantity of cottonseed meal was fed in addition, daily, and for roughage this young world's champion had 70 pounds of beets, 25 pounds of dried pulp and a reasonable quantity of alfalfa and mixed hay.

Glen Alex Queen De Kol

PINEHURST HOLSTEINS AT SALE

In another column may be seen announcement of the Pinehurst Dairy Holstein Dispersal Sale. This is to be held at Lake Mills, Wisconsin, June 12. Mr. Everson, general manager of this great ranch, writes that this is to be a complete dispersal sale of this great herd. There will be 95 head of extra choice animals, 50 of which are cows, 44 of these having official records. One of these, Pinehurst Piebe, has a record of 34.43 pounds. There are 13 cows with yearly records of over 800 pounds.

Hog Raising Axioms

The purebred makes the largest gains on a given amount of feed.

The purebred has been bred to mature at an early age.

Purebreds are more likely to be uniform in quality and color and, of course, will bring more on the market.

A purebred boar of the right type is necessary.

The sow that will raise eight or nine strong pigs is worth four times as much as a sow that will only raise half as many.

Full records must be kept of the mating of sows.

Litters should be sized according to the suckling capacity of the sows—eight strong pigs make an ideal litter.

About a 200-pound hog is a desirable weight and most profitable.

Boar pigs should be altered before they are weaned, for it will check their growth less at that time.

Too many litters should not run together—as the stronger pigs will rob the weaker, causing many runts.

Internal parasites, lice, and lack of attention are the three things that work greatest havoc in profitable pork production.

The sow has built cities, paid mortgages, made livings and bought automobiles; and she has been the last to receive attention and the first to show profit—and this while sleeping in a dust bank or a manure pile without care. What would she do if given a chance under ideal conditions?

FIELD NOTES FROM THE LIVE STOCK MEN

The Delta Farm and Live Stock Company of San Bernardino County report the sale of sixteen young Duroc-Jersey sows, and one boar to Mr. A. Gregory of Redlands. Mr. Gregory is going to sell all other sows and will breed the Duroc-Jersey.

The Llano Colony in the Antelope Valley has recently made a purchase of Duroc-Jersey sows and boars that puts them in the foremost ranks as Duroc breeders of the West. Under the supervision of Director John Will, head of the swine department, they have recently purchased from Peters Lamson & Walker, of Devore, the highest-priced boar ever sold by that firm. This boar, Col. the King, has been one of the favorite boars in this herd for a year and a half and has proven himself a sire of the first class. Col. the King was shown at the world's fair together with five of his litter mates and all six were in the money. The Colony also bought 16 sows and 17 young pigs, the latter being sired by Grand Golden Model and Educator Col. This final purchase of high-class animals comes as a culmination of several other purchases made from Peters Lamson & Walker, aggregating 23 sows and one herd boar in the last 18 months. The good that such stock will do to the newly developing Antelope Valley can hardly be over estimated.

DUROC-JERSEY RECORD

The National Duroc-Jersey Association, of which J. R. Pfander of Peoria, Illinois, is secretary, announces that Volume 51 of its record is ready for the mailing. This volume is the record of males 193501 to 201499, and of females from 484700 to 508698. It also has illustrations of the Duroc-Jersey headquarters, with half tones of the officers and directors.

We note in the Live Stock Reporter of Clay, Robinson Company of Chicago that Eugene Grubb of Glenn County, this state, reports that "there are many other reasons for investing in California live stock propositions now. The sheep and cattle stock in Australia and the Argentine have been depleted by drouths and heavy demand. In California sheep do not suffer from stomach worm, as in the Middle West. Climatic conditions in California make it possible for ewes to drop lambs in November and December, and these ewes and lambs run on grass during the winter, and the milk lambs are ready for market in March, April and May—coming in ahead of the Tennessee and Kentucky crop. These lambs are produced at the lowest possible cost—no one in America can compete with them."

The well-bred cow the same as the grade must be properly fed and cared for if she is to be a good producer. The cow testing associations that have been organized in various counties in this and other states are doing much to show farmers the value of good breeding, good feeding and care.

ARTESIA, CALIFORNIA

Purebred Registered
HOLSTEIN CATTLE

All records for butterfat production in 365 days, not only Holstein-Friesian but those of all other breeds, were broken in 1915 by the registered purebred Holstein cow, Duchess Skylark Ormsby 124514, when she produced 27,761 pounds of milk containing 1,205.09 pounds of butterfat. The test was made under the supervision of the Minnesota Agricultural College, thirteen different supervisors being employed. This wonderful cow freshened at the age of 3 years and 3 days. Holstein cows as a rule milk longer and produce much larger quantities of milk than any other breed, a fact that has made them the choice of progressive dairymen everywhere.

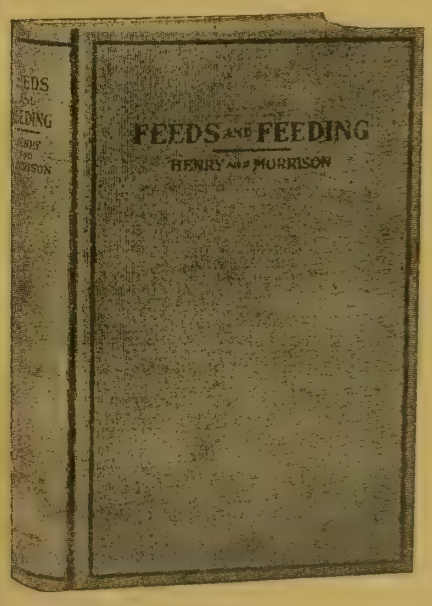
Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

Latest Edition.

This is the latest edition containing the new chapter "Economy in Feeding Live Stock" and much other information recently found by investigators in this and other countries.



701 PAGES—Cloth bound and full of Valuable Information

How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 162, 303, 309, 360, 414, 454, 525, 590.)

We Are Going to Give These Books Away

READ OUR OFFER TO YOU

If you would know feeds, their value, what to feed, and how, get this neat book, that thoroughly covers the subject. With the information it gives at your command, you can cut many dollars from your feeding cost.

Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at $1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you $2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers. The results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only $1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at $1.00 each quickly and easily. Send us the $3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at $1.00 each. There must be at least two new subscriptions for one year.

Household Department

SPRING IN CALIFORNIA

Written for California Cultivator
By Mrs. J. P. Scribner, El Cajon

Just a bit more softness in the color of the skies;
Just a bit more gladness in the bird's song, as he flies.
Just a bit more greenness, that is brought by April showers;
Fields and hillsides covered o'er with many brilliant flowers.

Just a hurrying and buzzing of the bees within their hive;
Just a feeling that all nature is so glad to be alive.
Just a melting of the snows from off the mountains tall;
But it's not so very different from winter, after all.

NEXT HOUSEHOLD CONTEST

Saving strength. With all our saving the most important of all is the saving of health and strength to the mother who is the keystone of the arch of the home, whose physical strength is essential to not only the physical but the moral, mental and spiritual strength of all the other members. Note how Mrs. Pettengill puts it in this week's Cultivator.

The reckless spending of strength is so easy—so necessary we usually think—even to those most rigidly trained and practiced in economy of butter and breadcrumbs.

What does the saving of strength amount to? If it is important how can it be attained in these difficult times? How do you manage? By the simple art of doing without? By making the head work to save the back and the heels? By teaching responsibility to the little ones? By cooperating and asking cooperation of family and friends?

Cash Prizes

For best article $2.00 cash; for second best $1.00 cash; for all published one year's extension of subscription to the California Cultivator unless such extension has already been granted in 1917.

Write Early

All articles should be in this office by Thursday morning, June 21. They will appear in the Cultivator of June 30. Address Household Department California Cultivator, Los Angeles.

PRIZE WINNERS

To Mrs. Guy Halley, Lindsay, first prize, $2.00; to Mrs. J. V. Coble, Ripon, second prize, to all others published, one year's extension of subscription to the California Cultivator.

This latter is an increase over extension promised in the prize offer—three months—but the articles are so exceptionally valuable that the Cultivator has made the change. Other articles than those appearing this week are in type and will be given later.

Pet Economies

Written for California Cultivator By Mrs. Guy Halley, Lindsay

"NEW York City's garbage, for one month, if turned into by-products, would net enough to feed starving Belgium for three months."

The above appalling statement was recently made in a lecture which I heard, and set me to thinking and to see where I could "do my bit" toward reducing waste.

All unedible portions of fruit or vegetables which cannot be possibly used, are cooked until tender and bran mixed with them to form a crumbly mash for the chickens.

Instead of throwing away horseradish leaves, use as spinach. Remove the tough veins, plunge into boiling water for ten minutes to remove the bitterness, and then remove and cook as spinach.

Left over coffee may be mixed with powdered sugar to frost a coffee cake or gingerbread. Dotted with raisins it makes a tasty and pleasing icing. Coffee may be used in cooking tapioca and served with cream or rich milk and sugar is very good indeed.

By using one-third rye flour in bread making one saves on the wheat that is so precious now.

If a spoonful or two of fish, peas, beans, or corn are left, use them in scrambled eggs or omelet. They may be used in salad also.

In our locality we can buy salt salmon at ten cents per pound. By soaking till the salt is removed and fried or baked and served with cream sauce, it is almost as delicious as fresh salmon costing 18 or 20 cents.

When eggs are high I use junket tablets to make many appetizing and delicious desserts. They only cost ten cents per box of ten and can be bought at any grocery store with directions for their use.

Every scrap of meat is utilized in hash, soup or meat cakes. Even potato water is used in place of milk in mixing up pancakes. By using part milk and part potato water delicious pancakes may be made.

Burnt matches are handy when one uses an oil stove. A dish is kept on the lower shelf of the stove and one burner may be lighted from another by using a burned match instead of a fresh one.

All bits of soap are carefully saved and a soap jelly made from them by adding a quart of water and two tablespoons of kerosene and boiling till clear.

By cutting women's stockings into strips and putting into a 20-cent mop handle one can have a very good dustless mop with the addition of a good floor polisher, and I use the old worn out socks of my husband's as mop rags. They absorb readily and may be wrung very dry.

Wishing to have a bath mat and not having the wherewithal to get it, I used the best part of an old white bed spread and hemmed it. Behold! a bath mat easily washed and cared for.

Even one's rose petals may be dried and used in place of feathers for sofa pillows.

Having practiced these economies I hope some one else may benefit as I have found them worth while.

Saving Kerosene

Written for California Cultivator By Mrs. J. V. Coble, Ripon

I COOK, wash and iron for a family of five on a three-burner oil stove, and my pet economy is the saving of fuel, namely, kerosene.

As soon as breakfast is over on wash days, the boiler is put over two burners with water enough for breakfast, dishwashing and the first suds for the clothes. This leaves one

The Cultivator Patterns

8310—Ladies' Sport Blouse. Cut in sizes 34 to 42 inches bust measure. The blouse may be made in the 45-inch or 32-inch length and it slips on over the head.

8281—Children's Coat. Cut in sizes 2, 4, 6, 8 and 10 years. The coat is in Empire effect, has one-piece gathered skirt joined to yokes.

7834—Ladies' Dress. Cut in sizes 36 to 44 inches bust measure. The blouse is plain and the skirt is cut in four gores.

7890—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. This waist has the shoulder fronts gathered and the sleeves may be long or short.

8274—Girls' Dress. Cut in sizes 6 to 12 years. The dress slips on over the head, front panel and one-piece plaited skirt are in one.

8294—Ladies' Skirt. Cut in sizes 24 to 32 inches waist measure. The skirt is suitable for flouncing.

8308—Ladies' Dress. Cut in sizes 34 to 42 inches bust measure. The dress closes at the back and the gathered skirt is cut in eight pieces.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

LESS WORK

No coal, wood or ashes to lug. No waiting for the fire to burn up.
Meals in a jiffy and a cool kitchen all the time.
Bakes, broils, roasts, toasts. Better cooking because of the steady, evenly-distributed heat.
More convenient than a wood or coal stove for all the year 'round cooking, and more economical.
The long blue chimneys prevent all smoke and smell.

In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

NEW PERFECTION OIL COOK-STOVE

STANDARD OIL COMPANY
(California)

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from $15 to $20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get over $2 for wheat and raise 20 to 45 bushels to the acre he is bound to make money—that's what you can expect in Western Canada. Wonderful yields also of Oats, Barley and Flax. Mixed Farming in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. There is now an unusual demand for farm laborers to replace the many young men who have volunteered for service in the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to GILBERT ROCHE
Canadian Government Exhibit, San Diego, Cal.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

burner over which baby's bottles and nipples can be sterilized and sweetened for the day, starch water can be boiled or something can be started for the noon-day meal.

I bathe the baby, a youngster two months old, about 10 o'clock and use an oil heater for warming the room. As soon as the stove is lighted I place her bath water on it, assemble her clean clothes on the back of a chair nearby, and as soon as the atmosphere is warm enough, the bath water is also ready, the same kerosene achieving both purposes.

At night I fix baby's milk, give her her bottle part full and the remainder of the milk I put in a thermos bottle, and fill her nursing bottle from it during the night. This not only keeps the stove from having to be lighted during the night but prevents me from having to be up in the cold.

I arrange to do my ironing and baking on the same day, devoting the morning to ironing and the afternoon to baking. When ironing I keep my irons covered with an inverted bread pan and set a cold-handled stew pan, containing dry beans, soup or stew meat or dried fruit, on the bread pan covering the flatirons. When my ironing is done I have at least one dish ready for dinner and the irons heat quicker by being covered. When the light bread is ready to bake, I place the oven on the stove, light the fires and place bread on the top shelf of the oven. By the time the oven is real hot I have a cake, pies or some pastry which requires quick cooking and put on the bottom shelf of the oven. Or I bake what remains of the beans cooked in the morning, make dressing and roast the meat or make a fruit pudding. By opening and closing the oven doors quickly and carefully this does not interfere in the bread baking a particle.

By cleaning lamp, wicks and burners each week with water softened with a little soda and putting in a pinch of salt in the oil, I manage to use the cheap kerosene not only for the stoves but lamps as well.

The average cost of our kerosene for one week is 50 cents.

ECONOMY IN COOKING

Written for California Cultivator
By Mrs. Otis A. Carpenter, Earlimart

I THINK my "pet economy" is cooking without waste. I never cook rice and then drain it, as so many recipes say to do, but cook it in double boiler after washing thoroughly, and add just enough water to cook well. Never stir rice as it ruins it, but properly cooked it is very palatable and nourishing and we prefer it to any other cereal.

Never drain peas, spinach, asparagus, carrots, lima beans, parsnips or squash. Just keep enough water on to cook, about half covered, and when about done remove kettle cover and let water boil down, except in case of spinach. Wash leaves and cook with only the water that clings after washing, cooking slowly at first. Never salt vegetables until ready to serve as cooking with salt ruins the flavor. Wash and cook potatoes with skins on.

Save the chicken bones, pieces of skin and fat, boil with enough water to cover. Strain, add a quart of milk and a handful of powdered and dried celery leaves and you have mock oyster soup which all will relish.

When cooking meat or chicken, either boiling or baking, cook potatoes and carrots on and around the meat. It not only saves fuel but gives the vegetables a nice flavor, and the meat as well. Cut the carrots lengthwise and cook longer than the potatoes. When done remove and place in neat row on small platter, season and garnish with bits of the fine tops, for you know it is said we "eat with our eyes" also.

PET ECONOMIES

Written for California Cultivator
By Mrs. Geo. H. Pettengill

"PET Economies"? Why, bless your heart, I have a whole family of them, and I'll just introduce them, one by one, and leave you to make their acquaintance. Like people, some you will wish to cultivate, others you will not, but brief I must be, or you will (even as do I), skip to a shorter tale!

I do not heat two quarts of water if I need but one pint!

I do not chip ice; I cool water in a container in the lower compartment of the refrigerator.

I do not pare potatoes—I wash them.

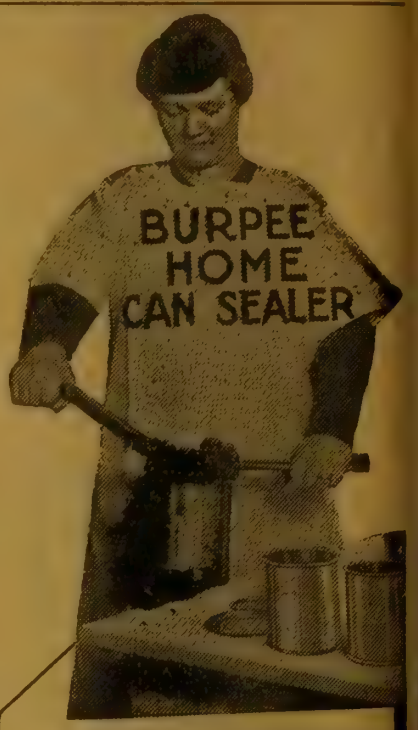
I do not leave the soap in the dishwater after obtaining my suds.

I use pulverized coffee.

I use a gas lighter instead of matches.

I use a fireless cooker when the gas required to heat the stones is less than that required to cook on the stove.

But my last and largest "Pet Economy",—the one which pays the finest dividends, is my endless and persistent effort to conserve my own strength and health, and if you are an expert in higher mathematics, you can figure out how much, in dollars and cents, I have saved by avoiding an undertaker's bill every year of my life!



CAN YOUR OWN PRODUCTS

Don't throw your surplus fruits and vegetables to the hogs. Turn them into profit. Can them with a BURPEE HOME CAN SEALER. Then sell them at top prices, or keep them for your own use.

No Solder Needed!

No solder nor acid are required with the BURPEE HOME CAN SEALER. Seals sanitary cans absolutely airtight. So simple a child can use it. So cheap that no home can afford to be without it. It's the greatest canning device of the age. Clamps to any kitchen table. Satisfaction absolutely guaranteed or money back.

Send for Free Book

It tells all about the simple, easy method of canning fruits, vegetables and meats. A book of recipes compiled with the assistance of U. S. Dept. of Agriculture is sent free with each sealer.

Write for full information.

SAVING THE LITTLE THINGS

Written for California Cultivator
By Mrs. C. E. Clark, Fontana

MY pet economy is saving the little things, for they all count up. One can save so much thread in sewing if they have several pieces to join and sew right on without cutting the thread as it saves cutting lots of unsightly ends of threads when the garment is done.

One can save fuel by cooking beans and baking bread while there is a fire for washing or other baking.

A good way to use up dry bread crumbs or dry biscuits is to make Yankee pone. Take one quart of fine crumbs, add one teaspoon of salt, one level teaspoon of soda, pour over enough boiling water to moisten then add one cup sugar, then thicken with cornmeal until it's hard to stir. Bake in a skillet or flat basin two hours in a slow oven. When taken out wrap in a cloth so the crust will steam and be soft. Eaten warm with butter you have a dish most all men folks like.

I believe in having a variety for it's better for the system and keeps up a good appetite and I don't believe a family eats any more in the long run than to have to eat enough of one of two things to be satisfied. I use Califene or cottolene for all kinds of seasoning, only using butter for the table and lunches. Our grocery bill is hardly ever over $30 a month and we have a family of six. We have our own milk and use very little meat when we have eggs; have garden stuff coming on. I find macaroni and cheese a nourishing dish and well liked by all the family.

With all this talk of economy for housewives why don't some one suggest that the men could save the money they spend for tobacco and cigarettes which have no real nourishment in them and spend for something for all the family; but then maybe the poor men have to have something to quiet their nerves.

SMALL ECONOMIES

Written for California Cultivator
By Mrs. Floy Crosby Smith, Fairoaks

WE have all heard so much concerning economy in food that there seems little left to be said on that subject, but I do not recall reading anything about economy in the sewing room. Perhaps some of us expect to economize in clothing by going without the usual new garments, but even in the making of the common ones we can, by a little thought, avoid waste, when we all know the prices of dry goods are still climbing.

Many of the paper patterns we buy are accompanied by a chart showing how to apply the patterns to the goods, but most of them call for much more goods than is really needed, because they instruct us to fold the goods through the center and by laying on the pattern cut the two corresponding pieces together. If instead we begin at the edge of the goods and fit our patterns to the whole width of the goods, cutting but one piece at a time, we can make the various pieces dove-tail into the given space and so save the big pieces along the edges that would be wasted by following the guide chart.

If you expect to use the same pattern again, notice carefully just how much goods it really requires by your method of cutting, then write the number of yards on the paper pattern. Then next time you have only to glance at your pattern to know exactly how many yards to purchase, and you will save buying an extra half yard or so, and also escape the embarrassment of finding yourself short of goods.

In making every day garments for children, as aprons or rompers, get them all from one piece of goods, as they will cut to better advantage than in various short lengths.

When the "good man" goes to buy his work shirts tell him to get two alike, then when one is past wearing its better portions faded to match will do to replace the wornout sleeves of the other.

The small boy's overalls protect his stockings, so when the feet are past darning the legs are still good. If you buy the separate stocking feet, which are usually sold for about six cents a pair, it requires but a few moments to sew them on to the old legs and the result will be hose that will wear nearly as long as a new pair.

To the busy housewife, economy of time often means as much as economy of material.

The following suggestions for time saving are not original but have been used many times and may be new to some one. When you wish to gather goods, as the top of a sleeve, or to fit to a yoke or belt, loosen the upper tension of the sewing machine and stich where the gathers are required, then by pulling the under thread you can draw up the goods as closely as you wish in a moment's time and with the added advantage that the fullness will stay just where you put it without basting.

When tucking, or sewing trimming on two pieces—as the fronts of a waist, it takes time and patience to get them exactly alike. To do this easily, lay the two pieces together and stitch the lines or designs on the sewing machine with the needle unthreaded, then you can follow on each piece the rows of needle holes.

As one has to alter patterns frequently to fit growing children, it is a good plan to cut at one time all the garments to be made for one child. This saves the time of repeatedly hunting up the patterns, measuring and making alterations. Roll up each garment by itself until ready to sew.

THE LESSON OF ECONOMY

Written for California Cultivator
By "A Subscriber," Riverside

THE lesson of economy is one I am sure that as a nation we very much need to learn. It has been said that a French woman would make a good meal from what an American woman would throw away. An old saying is that "A woman can throw away more with a teaspoon than a man can shovel in." From observation I think it may be true in some cases. Having been raised in a New England home the principles of economy were early instilled into my mind.

Personally, I believe I have no pet economy. Little things are looked after and saved.

Vegetable parings are cooked for the chickens, bread crumbs from bread cuttings, pieces of toast, crusts of bread are saved to grind for many purposes. Cereals left over cooled and cold water poured over are fried for next time or reheated with the next cooking. Fine coal is used in berry baskets and many things cooked over one end of range when large fire is not needed. Strings from bundles are rolled in a ball, and many more ways. Children were never allowed to waste food on their plates. These are a few ways that I have learned to economize.

MY PET ECONOMIES

Written for California Cultivator
By Mrs. J. B., Escondido

MY paper was late in arriving so I will stop my washing long enough to read the Household Department and write my "Pet Economies" and rush it to the post office.

My pet economies are; first, making vinegar, as I dislike to open a can of pickles and find the store vinegar has eaten my pickles up. Rinse every jelly glass, honey dish or fruit jar, also save every spoonful of left over fruit, for the vinegar jar, cook apple parings and save the water. Muscat grapes cooked and the water put in jars in a warm place will make fine vinegar, also raisins. You may need to add some sugar or honey to the jar except when the grapes and raisins are used they are sweet enough. Save all cake and cooky crumbs, dry and pulverize and use them in puddings instead of bread crumbs.

Now for another kitchen economy: Buy the coarse thread meat scrap sacks of the feed man at 60 cents a dozen, bleach them out with washing powder, soap and kerosene. Cut in two lengthwise and have 24 nice, soft easy washing towels for the kitchen at 30 cents a dozen.

KODAK
on the Farm

A Kodak fits into farm life from the pleasure side, from the business side and as a recorder of the familiar events that are so full of interest—the sheep washing and shearing, the haying and harvest scenes, threshing time, and apple picking.

It gives pleasure on every holiday—the grange and Sunday school picnics, the fishing and hunting trips, the circus and the fair—then there are the familiar scenes around home; the children and their friends, the family pets—there is good fun in photographing them at the time and afterward the pleasure of the pictures in the Kodak album.

And on the business side the Kodak helps to keep the important records in a business-like way—the building and ditching, the live stock, the orchard, the crops. Pictures of these things with an autographic record made on the film at the time of exposure are invaluable to the business-like farmer.

It's all very simple with a Kodak and less expensive than you think.

Ask your dealer or write us for free Kodak catalogue.

EASTMAN KODAK CO., 473 State Street, ROCHESTER, N. Y.

Care and Feeding of Young Turkeys

Written for California Cultivator By Jean A. Koethen

SOARING feed prices in these times of stress ought to turn the attention of many farmers and poultrymen to turkey ranching, for under proper conditions and with proper feeding no other meat, except perhaps that of the domestic goose, can be as cheaply raised as that of our most toothsome bird, the turkey. The chief bar to successful turkey culture in California, where we have so many thousands of acres of unused land and a climate exactly suited to turkeys, is, it seems to me, a misconception of the nature of the turkey itself and of the care it requires. When feed is dear, why should we waste perfectly good grain on turkeys that are better off without it? Why coddle and fuss over little birds that only want a chance to hunt for their own meals? Why build them elaborate pens and houses, when they are better off in the open?

Not for a moment would I minimize the protection a newly hatched poult requires. The young turkey, perhaps because of generations of mistreatment, is a rather delicate bird and must be kept warm. A good motherly Orpington hen is ideal for this purpose. At the Rhode Island station they prefer chicken hens to turkeys as mothers because they are more attentive. When I first began to raise turkeys, having read that chicken hens were not proper mothers for turkeys I made the silly and disastrous mistake of trying to raise one brood in an outdoor brooder. The thing can be done, of course. Many turkey people are quite successful with brooders, but I learned too late that the little turks needed more heat than the brooder gave them. They simply piled up and killed each other in the effort to get into the warmest corner. Since then I have used chicken hens with entire satisfaction. A good hen in an open front coop will keep eight or ten poults warm in the coldest weather, and if she is kept confined while they run at large she is always ready to hover them when they come to her for warmth. These last few chilly days I have watched a hen caring for her poults in her coop under the big oak tree, sitting for hours at a time with outspread wings to warm their little chilled bodies when they run to her from the kale patch which is their favorite playground, and have wondered at her patience and devotion. This is what a poult requires. They are rather cold-blooded birds when young and need more warmth than chicks, but they must be in the open and breathe fresh air at all times. I have never tried to raise turkeys in confinement. Doubtless it can be done. Some breeders have done it with considerable success, but the ordinary farmer or backlotter makes a great mistake in attempting it. Older turkeys at large are a nuisance, but the little ones are very little trouble, and feeding is a far simpler problem when they are allowed to roam and nibble at will.

For 48 hours after they are hatched the turkeys get nothing to eat. They should remain quietly in the nest half this time, but as soon as they get restless should be removed with the hen to a clean coop, the floor of which has been covered with sand sprinkled over with fine chick grit. They pick at this and learn to drink from the fountain of fresh water which is before them. The hen is given whole corn but the chances are she will refuse it because the poults cannot eat it.

When the weather is cold and damp it is well to keep the poults the first few days in a warmer place than an open coop. An enclosed shed or a warm corner of the feed house where the little birds can be kept off the cold ground and out of the wind gives them more opportunity for exercise than they would have in an open coop, and a little extra protection at this critical time is worth while. My poults were in the feed house a week this spring, getting out in the middle of the day, but going back before the chill of late afternoon came on.

Chopped boiled egg and onion top or lettuce is the standard first feed for turkeys as it has been so many years for chicks. I started out this year with the firm intention of following the feeding program of the Rhode Island station, but dropped it at the end of the first week because of its elaborateness. The first days meals consist of finely chopped boiled egg and dandelion or lettuce at 8 o'clock; the same at 11 o'clock; stale bread soaked in sweet milk at 2 o'clock; egg and greens again at 5 o'clock. Two teaspoons of the egg and greens, which are mixed about half and half, are fed to 12 or 14 chicks. The bread and milk is not measured but is left before them about five minutes.

The second day rolled oats is added to the egg and greens but chick feed is given for the 11 o'clock meal, so this day's feeding is as follows: Eight o'clock, chopped egg, lettuce and rolled oats; 11 o'clock two teaspoons chick feed; 2 o'clock, bread and milk; 5 o'clock, same as 8 o'clock.

The third day's feeding is like the second. The fourth day the 11 o'clock meal is omitted and the 2 o'clock meal given earlier, so that the number of feedings is now reduced to three, and from now on the birds have only three meals. This fourth day they have one meal of egg and greens, one of chick feed and one of bread and milk. Afterward, says the bulletin, "Sometimes he feeds them bread and milk, sometimes egg, oats and green food finely chopped, sometimes grain and sometimes nothing but a handful of rolled oats. At about the end of the second week clabbered milk is set before them morning and night, a quart to 35 to 40 poults. By this time the boiled egg is dropped, the rolled oats and green feed chopped together being given in its place."

This method of feeding is ideal, and my only reason for not following it after the first week was that a simpler ration had served me well. This consists of the chopped rolled oats and greens according to the Rhode Island formula, with about half as much cottage cheese mixed in. The green is sometimes lettuce, sometimes onion, sometimes onion tops. As time went on, I began to add a little broken rice. Other years I have used wheat, cracked at first, and whole as soon as the poults could eat it. This year I had the rice on hand and no wheat, and I do not see why rice should not be a perfectly satisfactory feed for both chicks and poults. A good many poultrymen are using the broken rice with other grains this season for their chicks. Possibly it can be made ultimately to take the place of wheat.

But the essence of all turkey feeding is not what you feed; it is how much. At the Rhode Island station, after the poults have learned to eat, which is about the end of the first week, the poultryman begins what is called "time-feeding." He stands with watch in hand and lets them feed so long and no longer. At first the time is three minutes. Then, after another week, when the poults have begun to forage for bugs and flies, the time is reduced to two and a half minutes. During the second month, which is the time blackhead is most likely to appear, especial care is taken, and the tray is never allowed before the poults more than two or three minutes, and only twice a day, for the midday meal was dropped at the end of the third week. This forces the birds to forage for most of their food, which is just what they need.

POULTRY INSTITUTE

The Pomona Valley Poultry Breeders' Association is working in conjunction with the University of California in preparing for a poultry institute to be held in Pomona June 19-21, in the auditorium of the Pomona high school. The auditorium is an exceptionally fine gathering place and the site provides for abundance of parking for automobiles. It is anticipated that there will be hundreds of machines and the Pomona committee promises room for everyone.

On the first and second days of the institute luncheon will be served in the cafeteria of the high school. Thursday, the third day, the institute will be held in Ganesha Park, one of the prettiest little parks in all California. All attendants are requested to bring luncheon with plates and cups and the Pomona Valley Association will furnish free coffee.

Prof. Dougherty of the poultry division of the college of agriculture, University of California, and possibly other helpers from the university farm at Davis, will be present through the three days.

On Tuesday forenoon there will be addresses on housing and yarding of poultry; in the afternoon session, feeding for profitable production. It is aimed to end this session at 3:30 to give auto drivers opportunity to make distant homes.

On Wednesday, the 20th, morning session; vital factors in incubating chicks; afternoon session, fundamentals of successful brooding.

Thursday morning's sesion will be given to discussion of principles of poultry breeding; afternoon, selecting and culling the layers.

Pomona is one of the best convention towns in California and has a live wire bunch of committeemen preparing for this convention.

Limited Number of Chicks from Hens That Laid 194 Eggs Each Last Year

Wishing to help poultrymen to get high grade stock for building up their flocks, we have made arrangements so as to offer a small number of chicks from F. M. Molby's famous 194-egg hens.

So long as they last we make this offer: With every order for 500 White Leghorn chicks we offer FREE 25 Molby chicks and with every order for 1000 chicks we offer 50 Molby chicks free.

SCHOFIELD and OLSEN AT VAN NUYS will sell choice pullets 10 weeks old, all broken to roost at 55c each. This is for a short time only. Address all communications to

PEACH PRICES

A circular of Peach Association says:

According to inventory, we have unsold a limited quantity of both yellow and Muir peaches. We, therefore, offer our remaining stocks, each car to contain the following approximate percentages of grades, and at prices set opposite:

40 pct. Standard Muirs at	7½c
5 pct. Fancy Muirs at	9 c
10 pct. Extra Fancy Muirs at	9½c
10 pct. Standard Yellows at	7½c
5 pct. Choice Yellows at	8¼c
10 pct. Fancy Yellows at	8½c
20 pct. Extra Fancy Yellows at	9 c

All quotations bulk basis.

For 50-lb. bxs. unfaced, add	¾ per. lb.
For 50-lb. bxs. faced, add	⅞c per lb.
For 25-lb. bxs. unfaced, add	⅞c per lb.
For 25-lb. bxs. faced, add	1 c per lb.
For 10-lb. bxs. unfaced, add	1⅛c per lb.
For 10-lb. bxs. faced, add	1⅛c per lb.

We also have approximately three cars of slab peaches, which we offer at 7¼c, bulk basis.

We will continue to receive orders until further notice for fancy peeled peaches, either for assorted or straight car lots, at 12c, bulk basis.

All of the above we quote f.o.b. factories, California, where stocks are available, subject to our confirmation and subject to goods being unsold, for May-June shipment; prices guaranteed against our decline to June 30th, 1917.

HAY

Under date of May 26, Scott, Magner & Miller say:

Receipts for the past week 1039 tons. No new hay arriving except some new first cutting alfalfa. Prices on old hay are a little weaker.

Most of the hay coming is of best type, the cheaper grades having been practically all cleaned up. The demand for export shipment has continued about normal and can be depended upon to steadily take care of a certain amount of current arrivals.

Our weather has continued favorable for the growing crops and has resulted in increased growth in a most satisfactory way. The demand for alfalfa among dairymen has shown some activity and a few of them have been contracting for their season's supply, thus early in the season. The first cutting has been moving off very well. We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market. For prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.

The Final Answer

To the Tractor Fuel Question

WE believe that a farmer who buys a kerosene tractor costing hundreds of dollars is entitled to get what he pays for.

We **know** that **Titan** tractors are real kerosene tractors. When you buy a **Titan** tractor you are safe. You have the **written guarantee of a responsible Company** that your tractor will do good serviceable work, **using common coal oil as fuel** at all loads. That is the final answer to the tractor fuel question.

Titan tractors are now built in three sizes, 10-20-H. P., the 3-plow outfit; 15-30-H. P., for 4 and 5 plows; and 30-60-H. P. for the heaviest work of the largest farms. All operate on kerosene.

The 10-20-H. P. size is a two-speed tractor, 1.85 and 2.50 miles per hour, with a smooth running twin-cylinder engine, slow speed, mechanically oiled, starting and running on magneto. It can be used for any field work you would expect nine or ten horses to do, and it will run any machine that takes up to 20-H. P. at the belt.

If you place your order soon you can have a **guaranteed Titan tractor** for the heavy spring work. Drop us a line so we can send you full information at once. Don't wait. Write now.

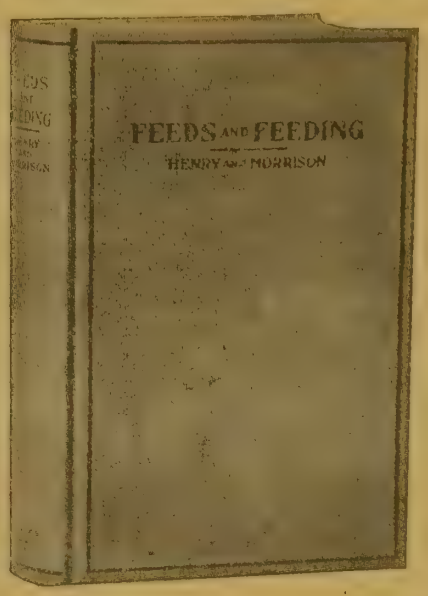
Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

Latest Edition.

This is the latest edition containing the new chapter "Economy in Feeding Live Stock" and much other information recently found by investigators in this and other countries.



701 PAGES—Cloth bound and full of Valuable Information

How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 162, 303, 309, 360, 414, 454, 525, 590.)

We Are Going to Give These Books Away

READ OUR OFFER TO YOU

If you would know feeds, their value, what to feed, and how, get this neat book, that thoroughly covers the subject. With the information it gives at your command, you can cut many dollars from your feeding cost.

Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at $1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you $2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers. The results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only $1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at $1.00 each quickly and easily. Send us the $3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at $1.00 each. There must be at least two new subscriptions for one year.

MORE CROPS

In these days of war and strife, the things we hear most about are more crops, and more abundant crops. Some eminent personage has said, "Whether for peace needs or for war necessities the use of fertilizer is the basis of crop production." The truth of this saying no one knows better than the man who uses Hauser's Organic Fertilizers. He gets more crops, more abundant crops and better crops.

Don't delay, communicate with Hauser Packing Company about your fertilizer needs, use fertilizer and get results.

California Cotton Possibilities

From an Address Before the National Association of Cotton Manufacturers in Boston Last April by Walter E. Packard of the Imperial Valley Experiment Station

Concluded from Last Week

CONTINUING the address of Mr. Packard we give this week some most valuable information as to labor and costs of cotton production in California.

* * *

The question of the future trend of varieties in this new field depends upon several variable factors. Profits, of course, come first. Cotton will not be maintained as an important crop unless the returns from sales greatly exceeds the cost of production. In an irrigated section the cost of water, the cost of water attendance, the price of land and the price of labor are all higher than in the South, and the yield from an irrigated field must exceed the yield of the Southern fields in order to overcome this initial disadvantage. The following table gives the costs of raising cotton in Imperial Valley:

	Mini. Cost	Maxi. Cost
Rent	$ 8.00	$12.00
Seed	1.00	1.00
Plowing	....	4.00
Disking, 8 ft. disc with 4 horses	.65	.65
Listing	.75	.75
Lath boxes	.65	.65
Harrowing	.25	.35
Planting	.25	.25
Replanting skips	.25	1.00
Chopping	1.00	1.00
Hoeing	1.00	1.50
Cultivation	1.75	3.75
Irrigation water	1.50	1.50
Irrigation attendance	1.50	3.00
Shipping seed cotton to gin.	....	2.00
Hauling to siding	1.50	3.50
Ginning	4.50	4.50
Feed for horse when not in use	....	1.00
Depreciation in equipment	.40	2.00
Interest on money borrowed to finance operations outside of rent	1.00	1.50
Exchange fees, insurance, storage, drayage, compressing and freight east.	8.00	12.00
Total cost growing 500 lbs.	$33.95	$57.90
Picking cost at 1.24c per lb. at a bale to the acre, absolute total	20.40	20.40
	$54.35	$78.30
Minimum per pound cost 10c. Maximum 15.6c.		
MEBANE TRIUMPH		
500 lbs. Mebane Triumph cotton at 12c	$60.00	....
1100 lbs. seed at $40	22.00	....
Total income at a bale to the acre	$82.00	$82.00
Less total cost	54.35	78.30
Net profit	$27.65	$ 3.70
DURANGO		
500 lbs. Durango at 16c	$80.00	....
1200 lbs. seed at $40	24.00	....
Total income on a bale at the acre	104.00	$104.00
Less total cost	54.35	78.30
Net profit	$49.65	$25.70
EGYPTIAN		
500 lbs. Egyptian at 22c	110.00	
1300 lbs. seed at $40.00	26.00	
Total income on a bale to the acre	$136.00	$136.00
Less cost of raising	33.95	57.90
	$102.05	$ 78.10
Less cost of picking at 3c.	54.00	54.00
Net profit	$48.05	$24.10

The above figures are based on what might be termed a normal market.

It will be noted that the total cost of raising the crop varies from 10 cents to 15 cents per pound on a bale to the acre basis, depending upon the care that was given the field in cultivation. If a large yield is to be expected there must be a proportionate amount of work done in the preparation of the seed bed and in the cultivation of the crop. It is apparent, then, that in order to balance the cost of irrigation, high rents, and expensive labor in an irrigated region, a bale to the acre is the minimum which can be profitably raised on a normal cotton market. With present war prices cotton can be raised with a profit quite easily, but under normal conditions short cotton will not survive unless a bale to the acre can be secured on the irrigated land. This statement can be modified in the case of the poorer land where the advantage of improving the soil by cultivation and leaching out alkali is considered as a portion of the remuneration, or where the rent of the land is so low that a profit is left above the cost of production. In certain areas where irrigation is not necessary as in the sub-irrigated portions of the San Joaquin and Sacramento Valleys, the cost of production will more nearly equal the cost of production in the South, but even here the yields would have to be proportionately larger in order to meet interest on greater values and to meet the higher cost of labor.

Not only will the returns of cotton culture have to materially exceed the costs of production, but the net profits will have to equal or approach the net profits that can be secured on other crops common to the region. Cotton in Imperial Valley has to compete with early truck stuff of all kinds. The Imperial Valley, for example, excels in cantaloupe production, the annual shipments exceeding the shipments from the second cantaloupe producing state. The early grape, winter truck, lettuce, peas and asparagus along with citrus and the golden date, are money making crops and are competitors with cotton for the irrigated land. It is true that soil conditions are not everywhere suitable to the raising of these high paying crops and cotton may be considered as a crop for the harder soils, but even in this case cotton must compete with corn, alfalfa and their copartners, hogs and cattle.

In meeting this competition it is apparent, therefore, that cotton must not only yield a profit, but must yield a profit equal to the profit from other crops. With the introduction of the silo and the improvement of stock and the extension of truck and fruit, there must also ultimately come the planting of high quality cotton if cotton is to survive. The cost of raising Egyptian or Durango cotton is little more than the cost of raising Triumph, except for the fact that the long staple cotton must in general receive superior cultivation, making the growing cost more nearly equal than the maximum figure. The following table gives the prices secured for Egyptian, Durango and Triumph for the past five years:

	Triumph	Durango	Egyptian
1912	12-13	15-16	21
1913	12-13	16-17	21-22
1914	6- 7	12½	14-15
1915	11-12	16-17	21-22
1916	16-20	19-29	28-55

During normal years the Durango has averaged from three to four cents above Triumph, and Egyptian has averaged from four to six cents above Durango.

Eliminating the cost of picking and ginning, then, the cost of production of all types is practically the same. Durango cotton, which sells at a premium of from three to five cents per pound, manifestly has an advantage over short cotton. The yield of this cotton ordinarily equals the yield of the Triumph and the picking cost is very little greater. Although the ginning percentage of Durango may average two per cent below Triumph, the Durango cotton still has more chance of survival in the Southwest than has the short cotton which now predominates. The cost of picking the Egyptian cotton is over twice the cost of picking Durango and the ginning percentage is low, but the difference in the price of the product is so great as to counterbalance the difference in the cost. Egyptian cotton on a normal market for the past six years, then, will be as profitable as Durango, providing the yields are equal. The records show that the yield of Egyptian has so far compared favorably with the yield of either the Durango or short cotton when properly handled. Natural prejudice against a new variety, the successful profits made with the Durango cotton and the fact that Egyptian is hard to pick and requires a roller gin, militates against any sudden change to this variety. If the present difference in price remains, however, the advantage would be so great in favor of Egyptian as to almost insure its wide planting. It is probable that the price of Egyptian will remain high on account of the damage done by boll weevil which are gaining entrance into the Sea Island areas.

Irrespective of varieties, however, the cotton acreage cannot be greatly extended until the present labor problem is solved. The growers had considerable difficulty in harvesting the 55,000 bales produced during the past year and must look for an available supply of labor if the acreage is materially increased.

In the Salt River Valley the Indians have been a source of supply not available in California in any large numbers. These Indians have made good pickers, although not nearly so efficient as either the white or the negro. Mexican labor has migrated from Sonora into Arizona during the picking season, and it is the hope of

1917 Crop Acreage, Imperial County

	Field Crops—Acres— Alfalfa	Milo Maize	Cotton
1917 (Compilation by Farm Adviser from Water Company reports)	114,491	106,354	78,400
1916 (Census by County Assessor)	95,562	52,207	44,116
Increase, Acres	18,929	54,147	34,284
Gain, Per Cent	20	104	75

In addition to above figures Lower California has this year 10,000 acres in alfalfa; 15,000 in milo; 50,000 in cotton.

VALUE OF AGRICULTURAL PRODUCTS IN COUNTY SINCE 1900

1900 (No cultivation	
1910	$ 5,000,000
1914	12,000,000
1915	15,000,000
1916	20,000,000
1917 (Estimated)	30,000,000

Cantaloupes at Planting Time

Imperial Valley is now sending out train loads of cantaloupes every day. The above scene shows fields with covers placed after planting.

Fumigating Tents

Full weight, specially woven material. Size of tents guaranteed. Workmanship of the best, and marking correct in every detail.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

the growers that a large supply will come from this source in the future. Chinese labor has proved efficient in Mexico, but the supply has not met the demand. The first Chinese to enter Lower California were paid 50 cents a day and board, which gave the Mexican growers a decided advantage over the growers on this side of the line. Prices have been forced up, however, so that the Chinese are now getting approximately $2.00 a day and board themselves. The contract system of employing labor in Mexico is becoming more prevalent. A Chinese foreman agrees to furnish all the labor, including pickers, and half the running expenses, not including rent or depreciation, and gets half of the crop.

Although there are a number of Japanese in both Imperial Valley and Lower California, they are inclined to do little picking, preferring to rent land and hire pickers.

The labor used in Imperial Valley is largely white and negro, although some Mexican and Hindu labor is employed. It is almost impossible to get more labor from the South, for the demand for labor in the northern industries has already depleted the supply. A large number of families have been moving into the Southwest from Texas and Oklahoma and have materially lessened the labor problem. Many of these families are settling on small rented farms where the family is able to do all the work, including picking. The hobo class of labor, which migrates to California to enjoy the mild winter climate, is very inefficient. These laborers often do not pick enough to earn their board, and usually quit a job in a day or two and go on to the next place. It is probable that the labor which follows the fruit picking season from the South to the North can be utilized in the cotton field during the winter months. The 5000 hop pickers who finish their work in Northern California in September could undoubtedly find remunerative employment in the cotton fields and would tend to relieve the pressure during the height of the season. Practically 50 per cent of the hop picking is done by family labor, which is usually the most efficient. Proper housing arrangements would tend to bring this class of labor to the cotton fields, especially if the cotton was grown in the San Joaquin or Sacramento valleys. The cost of transporting labor from the northern part of the state to Imperial valley has prevented any large migration so far.

This demand for a large supply of cheap labor is a strong argument against cotton in California, for the social conditions which generally result from the introduction of any large number of transiently employed are far from ideal. Cotton tends toward large rented farms where the necessary rotation of crops is neglected, land impoverished by continued cropping, and by neglectful cultivation, where the tenant has no permanent home and adds little to the social improvement of the community, and where transient labor turns toward crime or wasteful idleness during the portion of the year when its services are not in demand.

It is possible that in the Southwest the effort of the state and the federal government to establish homes on small tracts of land by better opportunities for colonization and by more favorable rural finance, may lessen this trend toward tenantry. The rural credits law will enable many worthy people to secure ownership of small tracts where they can establish a home, become a valuable part of the community and at the same time furnish the labor needed to carry on their own farming operations. A man on 40 acres of land in the San Joaquin Valley, for example, could well afford to put in ten to fifteen acres of Egyptian cotton each year in a system of crop rotation. His family should be able to pick a large portion of the crop, and the cost of picking would therefore remain in the family and the greater returns resulting from the sale of the superior quality of cotton would make cotton as profitable in such a rotation as any field crop which could be raised.

In conclusion, it may be said that California offers a bright field for the production of a high quality cotton. The extension of the industry depends upon the maintenance of pure varieties of high grade cotton; upon the application of the best cultural methods to give yields commensurate with the cost of production; and upon the solution of the labor problem, perhaps through an improvement of the present laws governing land colonization and rural finance, in order to give the man without money a chance to acquire land and establish a home.

The Southwest has already won an enviable reputation in the cotton world. The rich soil, long growing season, abundant sunshine, and plentiful water supply, make of the Southwest a factory for cotton production, quite perfect in equipment, and as Sir William Wilcox, the eminent British irrigation engineer, said, this section will some day be the center of the cotton thought of the world.

Mealy Bug Parasite

We have received "On the Life-History and Successful Introduction Into the United States of the Sicilian Mealy-Bug Parasite," a reprint from the Journal of Economic Entomology. It is written by Harry Scott Smith, in charge of the state insectary at Sacramento and Alhambra.

The citrus mealy bug has been a most perplexing pest in many sections of California. It has caused untold loss and many heartaches. Double fumigation and even quadruple sprayings have been found, if not wanting, at least not as successful as the orchardist desired. If the parasite described by Mr. Smith is successful orchardists will surely call it blessed. The hopeful view as to the success of the parasite is given in the last paragraph of the article in the journal.

The question now arises as to what we may rightfully expect from the introduction of this parasite. It is now thriving and increasing rapidly in all the field colonies. The remarkable way in which it has increased during the short time since it has been introduced, the fact that it has proven itself adapted to environmental conditions, and the fact that it fills a gap in the natural control of the host justifies, I believe, the hope that it will become of great economic value. It is too much, of course, to expect that this parasite alone will be able entirely to control the citrus mealy-bug, but its introduction will certainly prove an important step toward the desired end. Time alone will show its true worth to the citrus industry."

American Plants

Written for California Cultivator By E. Braunton

IT is somewhat amusing to note how tenaciously we cling to plants with foreign names or known to come from foreign lands, and seemingly avoid the use of better plants that are native to our own country and in many instances to our own state.

The most noted authority on gardens in Engand, William Robinson, has stated that Romneya Coulteri, the Matilija poppy, is: "California's finest contribution to horticulture," and indeed it is one of the finest flowers in the world. It is native only to Southern California, thrives splendidly in the garden, yet there are more Matilija poppies to be found in the gardens of England than in those of Southern California.

We are constantly buying iris, and they are either called German, English, Spanish, Japanese, Siberian or Alpine, though we have some fine American species, and many of the best types of foreign species were hybridized in this country. On the Pacific Coast we have more than a half dozen finest of species, the best of which are native to California. In fact our native species are extremely ornamental and should be freely planted. Why not American plants, American or Californian iris, etc? There are no better ones; why, in view of the European war's embargo may we not supply our own gardens with our own native material and do away with this false standard, based on the mythical values of things brought from foreign lands. When we get down to a proper appreciation of native plants we may perhaps have true California gardens.

Acclimated Plants

In the Eastern states where the climate is severe plants freshly imported from Europe and elsewhere in many instances perish the first winter because they have not become acclimated before being exposed to the exactions of severe cold weather. Plants from Japan and damp climates arriving here in spring do not always pass through our dry summer months unscathed. If they could pass through one summer in the lath house or with some protection and so have made one year's growth under Californian conditions, they will prove successful when planted in the garden.

Country Roadsides

Nearly every roadside is aligned, where planted at all, by a miscellaneous lot of trees, shrubs, and lowlier plants and, it must be said, often with good results. The same planting in the city would not do at all, being out of harmony with the formalism everywhere in evidence. Yet in rural districts all planting should be simple and then it would have dignity. One other point is of even greater importance, and that is cleanliness. If the roadsides are neat and well kept the general effect and impression can scarcely be bad. Natural roadside planting where roads have been run through groups of native shrubs have been the envy of planters for all time. Nature is hard to beat.

Country Gardening

Rural residents should be encouraged to garden by the fact that all plants do better in the free air of the country as against the contaminated air to which all city gardens are subject. Soot and smoke acids, together with other gases, make it impossible to garden in some localities. Near a smelter it has been found that plants were injured at least 20 miles to windward. Therefore the rural resident should take heart and garden extensively and intensively, for the forces of nature are with him, and he is usually beyond the power of mankind to contaminate the air that he and his plants breathe.

Variety of Lilies

Lilies thrive in California when grown in partial shade, on a northern slope, or on the north side of shrubs, fences, or other objects that will keep the soil cool. It makes little difference how much sun shines on the plant; the bulbs do best in a light well-drained soil. Some sand and considerable leaf-mold, decayed sod or other rotted vegetable matter fairly free from animal manures is a splendid medium in which to grow lilies. Of species and varieties of lilies there is no end; a catalog received last week from Japan lists a total of 39.

Garden Fertilizers

Had I fields and garden I would put well-rotted stable manure on the garden, even though it took the full supply, and buy other supply or commercial brands for the field, for animal manures are by all regarded as the best for either flower or vegetable garden. I would not use fresh manures, but at least wait until the process of decay has well started, for the process has to take place somewhere, and strawy manure especially should be reduced in bulk and tempered to a more uniform and less dangerous stage before applying without discrimination to the garden.

BUICK SAXON

Buick AUTOMOBILES & TRUCKS
J. D. LAUPPE
Sacramento, Cal.

Gentlemen:

We have found Zerolene to be a satisfactory lubricant for BUICK automobiles and trucks.

Very truly yours,
J. D. Lauppe

SAXON
DU BROY MOTOR COMPANY
INCORPORATED
MOTOR CARS
VAN NESS AVENUE AND TURK STREET

Gentlemen:-

From our own experience and the reported experiences of Saxon owners in California, we know Zerolene to be a most satisfactory motor oil. We never hesitate recommending it whenever consulted by our owners on the matter of motor oil.

Very truly yours,
DU BROY MOTOR COMPANY

Endorsed by Leading Car Distributors

—because the records of their service departments show that Zerolene, correctly refined from asphalt-base crude, gives perfect lubrication with least carbon deposit

Less wear and more power because Zerolene keeps its lubricating body at cylinder heat. Less carbon because, being made from asphalt-base crude, it burns clean and goes out on exhaust

Zerolene is the oil for *your* car—whatever the make—the oil for all types of automobile engines. For correct grade, get our lubrication chart covering your car

At dealers everywhere and Standard Service Stations

ZEROLENE
The Standard Oil for Motor Cars

STANDARD OIL COMPANY
(CALIFORNIA)

List of Varieties We Grow:-

Standard Oranges: Washington Navel, Valencia Late.

Standard Lemons: Eureka, Villa Franca and Lisbon.

Standard Pomelos: Marsh's Seedless, Triumph and Imperial.

Standard Limes: Tahiti Seedless and Mexican.

Standard Kid Glove Oranges: Dancy Tangerine, King Mandarin, Willow-Leaved Mandarin, Satsuma-Oonshiu.

Table and Ornamental Oranges: (Paper Rind, St. Michael, Ruby Blood, Navelencia and Jaffa.) Golden Nugget Navel, Golden Buckeye Navel, Sweet Seville, Bouquet des Fleurs, Golden Variegated.

Garden and New Citrus Fruits: Sampson Tangelo, Sweet Lemon, Sweet Lime, Golden Variegated, Ponderosa, Seedless Lemon, Citrus Limonum, (Dwarf Lemon), Thornless, Rangpur and Red Limes, Lue Gim Gong Orange, Nagami Kumquat, Algerian Satsuma Orange, Algerian Tangerine Orange and Citron of Commerce.

Combination Citrus Trees: Budded to from four to six different varieties of fruit.

Orange, Lemon, Pomelo, Lime Trees

Successful citrus fruit tree planters invariably pay more for Teague trees than they do for those of other growers. Why? Because experience has taught them that Teague trees yield better and more fruit than those grown with less care and attention. The practices of the successful are a safe guide for beginners and the inexperienced, showing where to "head in" to attain good results. . . . The cool weather of May makes June planting of citrus fruit trees not only feasible but opportune, as cloudy and rainy days followed by higher temperature are excellent for citrus tree growth. . . . Prices cheerfully furnished. . . Telephone Home San Dimas 5.

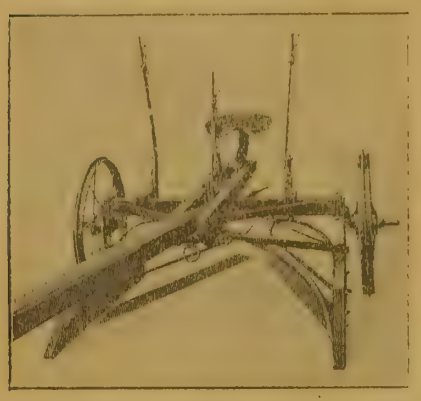
BRENNEIS Two Row Riding **BEAN CUTTER**
IT SAVES ONE MAN'S TIME, DOES BEST WORK, SOON PAYS FOR ITSELF.



You cannot afford to lose time with old implements when labor is scarce and prices as high as they are this year. It's time to look ahead a little. If you order now you can get our fast TWO-ROW RIDING BEAN CUTTER made for California conditions in the great Ventura County bean fields. This machine has over 20 years successful experience behind it and our factory is here close at hand to back up every guarantee. This implement cuts two rows at once and draws the two rows of vines together. Each cutter is equipped with extra long blades, and convenient lever shifts to make the work accurate and easy. No bean ranch is complete without one of these economical labor saving bean cutters.

On account of the large crop the big demand, for bean tools and the uncertainty of supply of steel, all orders should be placed at once, otherwise delivery is most uncertain.

Make the reading of advertisements in the California Cultivator a habit. They will broaden your knowledge of the manufacturing improvements.

Foliage Plants

It is not necessary, in order that our gardens may be beautiful, to plant nothing but flowering plants. Flowers do not appear at best except where much foliage is seen. Therefore, in summer at least, use cannas, bananas, gingers, aralias, caladiums, cyperus, papyrus, ornamental corn or maize, bamboos, and grasses large and small, green, striped, and red, also with colored plumes or tassels.

Garden Finish

In gardens filled with good trees and shrubs I have often felt the lack of something—the landscape did not attract, though many of the plants were of themselves of interest, and beautiful. The lack was finish. There were no lowly borders or patches of flowering plants such as one finds at the feet of shrubberies in the canyons and hills. Nature preserves nice balances and therefore harmony is ever present. Man should copy nature and thereby make his home grounds attractive.

Drying Winter Vegetables

MANY kinds of vegetables can be dried and thus made available for use throughout the year. The methods are simple and similar to those used with fruits, and can be applied anywhere in California.

The method described here is suitable for turnips, carrots, beets, potatoes, and other similar root vegetables. This method is given by the division of viticulture of the University of California.

Peel or scrape the roots and cut into slices one-fourth to three-eighths of an inch thick.

Spread on wooden trays. Those used for fruit drying are the best. Any light wooden trays of suitable size can be used. A two-foot by three-foot raisin tray is convenient. They can be made from half inch boards, shakes, or even from old boxes.

Expose the sliced vegetables on the trays to the fumes of burning sulphur. An ordinary "sulphur box" used in drying fruits can be used.

A simple sulphur box can be made of tongue and groove boards or more cheaply of a wooden crate, covered with ordinary tar paper to make it fairly air-tight. The box should have cleats on the inside on which to place the trays, or strips of wood should be placed between the trays. They should be so spaced that there will be about two inches between the trays for the circulation of the sulphur fumes. The box should be open at the bottom and is placed on the ground with the open side down over a hole in which the sulphur is burned. This hole should be about eight or ten inches wide and deep enough to avoid burning the trays—about eight inches.

As soon as the box is filled with trays of the sliced vegetables, the sulphur, in a shallow iron or earthenware pan, is placed in the hole and ignited. The door of the box is then closed. In from 15 to 30 minutes the sulphuring is complete. These vegetables can be dried without sulphuring, but the color, flavor, and keeping qualities are inferior and the drying is slower.

Place the trays in the sun until the vegetables are dry. This will require but two or three days in good weather.

The dried vegetables may be kept in stoneware jars, closed bins or heavy sacks. They should be protected from moths, weevils and other insects. If they become infested, the insects may be killed by heating the dry vegetables in an oven for about five minutes, or by placing them in a tight covered box and allowing a little bisulphid of carbon to evaporate from a saucer placed on top just below the box cover.

Dried vegetables must be soaked in water for 24 hours before being cooked. They can be used for nearly all the purposes of fresh vegetables, but are particularly suitable for soups and stews.

Reports California Potatoes

The assistant truck crop specialist for the state of California reports as follows as to California potato conditions:

"Extra early potatoes in the San Pedro hill region near Los Angeles are 75 per cent harvested. The bulk of the early potatoes around Los Angeles are just beginning to move in a big way, however, the first car being shipped May 8. By the 15th it is expected that the crop will be moving rapidly and shipments will continue to be heavy for several weeks. The crop is turning out much better than was expected in view of the unfavorable weather conditions. In spite of frosts and shortage of rainfall, the production is said to be heavy.

"In the Colma district of San Mateo County, which is one of the early sections in this part of the state, the potatoes are showing up well both in quality and in yield. The potatoes grown are the Garnets, and as they were not frosted this year the condition of the crop is excellent.

"The Alameda County potatoes on the market this year are running larger in size than last year and are producing a correspondingly larger yield. Due to a shortage of late rains the small tubers ripened before they had attained much size. But this year no such difficulty has been experienced.

"These potatoes are usually on the market during March, April and May. This year they have been about one month late and were particularly late in the Santa Clara Valley.

"The potatoes in Imperial Valley produced an enormous vine growth but no information has been secured on the final yield of the crop."

California harvests about 4.5 per cent of its crop in January, .6 per cent in February, .4 per cent in March, 1.2 per cent in April, 12.3 per cent in May, 27.3 per cent in June 12.7 per cent in July. Less than half of our output comes from the fall crop.

CULTURE NOTES

Conserve the moisture in the soil for the use of the growing plants by keeping a fine surface tilth on your land. This can best be secured by frequent harrowing with a light tooth harrow. Do not be afraid to harrow your grain crops after they are up. A light harrow will do no harm, but will help to keep your soil in good tilth and kill weeds starting amongst your crops.

Riverside County is lining up for a county fair.

ASPARAGUS IN CALIFORNIA

The assistant truck crop specialist of the bureau of crop estimates, United States department of agriculture, for the Pacific Coast states, reports on the asparagus situation in California as follows:

Condition

The condition of asparagus on the Sacramento and San Joaquin deltas May 1 was 95 per cent of normal. While the yield to date has been below normal for the season it is expected that there will be an average crop. The size of grass has been very good.

Growing Season

The first part of the growing season was very unfavorable on account of low temperatures. The season opened late and grass came on very slowly, depriving the shippers of their usual portion and bringing on a larger part of the crop than usual after the canneries opened. The daily cuttings have varied extremely. A few days of warm weather brought on the crop so rapidly that canneries were obliged to put it into cold storage until it could be handled. At time of writing it is coming very slowly again.

Labor and Production

Shortage of labor has been felt severely and some of the growers have not been able to keep their entire acreage cut during days of heavy cutting.

Percentage of Crop Delivered to Canneries

It is estimated that 66 2-3 per cent of the asparagus grown is handled by the canneries. This year the percentage handled by the canneries will exceed the average quantity. There has been a yearly increase in the number of cans packed.

Acreage of Asparagus

The estimate of asparagus in the central part of California is as follows: Sacramento County in 1916 12,530, in 1917 18,480; Contra Costa County in 1916, 3040 and in 1917 3630; San Joaquin County in 1916 525, and in 1917 600; scattering counties in 1916 500, and in 1917 500, or a total for the two years of 17,595 and 23,210 acres.

HOW TO PREPARE SEED FROM THE EARLY CROP OF POTATOES

By William Wood, Los Angeles County Horticultural Commissioner

If seed from the present crop is to be used the potatoes should be allowed to remain in the ground until matured enough so that the skin will not break or slip when rubbed together. Then sort out the best shaped and smoothest potatoes (including the small ones if they are a good shape and an inch in diameter) and spread the ones that are to be used for seed so that they will be exposed to the weather, under trees, or where they will be partly shaded from the hot sun. The effect of the weather exposure will be to hasten the maturity, and the buds or sprouts will develop within a month. If the potatoes are treated in this way they will start to grow evenly and a good stand should be the result. None but early varieties should be planted after July 15. I would advise not to plant potatoes that were immature or dug when the skin would slip. If the new crop of potatoes is to be used for seed they should be exposed for a month to the weather.

The Japanese Farmers' Association of Imperial Valley reports 13,232 acres in cantaloupes.

Canning Fruits Without Sugar

SUGAR used in canning or bottling fruit is for the purpose of improving the flavor and is not necessary for preservation. The division of viticulture of the University of California gives the following directions for canning without sugar:

Fruit of any kind suitable for canning may be preserved without any sugar. When the fruit is consumed, the sugar can be added exactly as is done with fresh fruit. If the fruit when canned is thoroughly ripe it may be consumed without this addition of sugar and is sweet enough for many tastes.

The ordinary methods of home canning are used. These are the "cold pack" and "hot pack" methods.

For the former the fruit is washed, peeled, pitted or cored as needed and packed tight in clean, scalded cans or jars. Water is then added, boiling in the case of cans, and as hot as possible without cracking the glass in the case of jars. Scalded caps or covers and rubbers are then put in place loosely and the filled cans heated in a vessel of boiling water for 20 to 40 minutes. An ordinary wash boiler furnished with a wire screen or a wooden grating on which to place the jars is suitable for this purpose. The boiler should contain enough water to rise about half way up the sides of the jars.

While still at the boiling temperature the jars or cans are removed, sealed and placed to cool, lying horizontally or upside down.

For the "hot pack" method the prepared fruit is placed in a large pot on the stove with a little water to prevent burning. After heating to the boiling point and cooking until the fruit is tender and some of the juice has exuded, it is poured into the cans or heated jars by means of a wire or perforated ladle and a wide funnel. Sufficient juice from the pot is then added just to cover the fruit and the cans or jars sealed. These are then heated in the boiler for about 20 minutes. For a second batch of the same fruit the juice remaining in the pot should be used instead of water for the preliminary cooking.

With some fruits there will be an excess of juice. This can be used in the canning of other kinds of fruit or for making blended jams, marmalades or jellies. In cases where there is not sufficient juice to cover the fruit when placed in the jars sufficient hot water may be added for this purpose.

Pacific Coast Nurserymen

The 15th annual meeting of the Pacific Coast Association of Nurserymen will be held at Tacoma, Washington, July 11-13.

The executive committee has proposed a program which includes the subjects of; "A Landscape Department in the Nurseries"; "Laws Governing Street and Wayside Plantings"; "Grades, Terms and Prices"; and "A Packing Standard" to be given careful consideration and subject to any action deemed best. The educational topics will include "Rose Propagation"; "Nut Tree Production"; "Coast Grown Seedlings"; "Selling Methods"; "Pear Blight" and "Inspection Problems." The reports of vice presidents, officers and committees will contain valuable information.

At the close of the meeting it is proposed for those who desire to make up an excursion for a visit to Paradise Valley, in the Rainier National Park.

Citrus By-products Service Inaugurated

That the United States Department of Agriculture is aiming to aid California citrus growers is shown by the following announcement which it is now sending out:

"A new service, designed to bring manufacturers of citrus by-products in touch with consumers, has been inaugurated by the citrus by-products laboratory, bureau of chemistry, United States department of agriculture, located at 142 South Anderson Street, Los Angeles. On the producing end this laboratory is in touch with firms in California which can supply citric acid, citrate of lime, essential oils, candied and dried citrus peel, flavoring products and vinegar.

Firms who purchase by-products are requested to list their names and needs with this laboratory. Names and addresses of prospective purchasers will be communicated to the producers and offers from the producers will be supplied to those listed as purchasers.

California Ahead

Mr. H. L. Musser of Aggeler & Musser, writes: "It may be a matter of general interest to the public to learn through your columns the comparative yields of the various grain sorghums. This table is copied from United States Bulletin No. 278 on Grain Sorghums, but we have broken the record in California:

	1913	1914	1915	1916	Ave.
Dwarf Milo	2605	4450	5031	2214	3575
Standard Milo	1492	3480	4830	2362	3041
Feterita	3164	2380	3139	1953	2909
White Kafir	1400	1533	1092		1342
Red Kafir	128	1250	1434	315	782
Shallu		4200	4609	1816	3542

"Mr. W. W. Flicker, Tulare County, advises us that his field of dwarf milo yielded on an average more than 6000 pounds per acre. Dwarf milo is growing more popular each year; its dwarf habit is of great advantage and in other respects it is very satisfactory. It is more easily harvested; it is desirable to plant in young orchards. The tall sorghums shade the tree very much to their detriment, but the dwarf milo does not shade or injure the trees when they are young."

NEW MEALY BUG PARASITE COMING.—PROVED VERY EFFECTIVE IN THE ISLANDS

The insectary division of the state commission of horticulture reports the receipt of a colony of a new species of mealy bug parasite from the Hawaiian Sugar Planters' Station of Honolulu. This parasite is said to be very effective in the islands against the mealy bug pest, and it will be bred at the Southern California branch insectary at Alhambra for placing in the infested citrus groves. The name of this parasite is Pauridia peregrinia Timberlake.

Orchard Heater Test

Citrus growers will be interested in the test of fire fighting appliances to be made in Pomona Tuesday, Wednesday and Thursday nights of next week, June 12, 13 and 14.

IRRIGATION OF RICE

"Irrigation of Rice in California," written by Ralph D. Robertson, Irrigation Engineer, Irrigation Investigations, Office of Public Roads and Rural Engineering, U. S. D. A., is published by the University of California as bulletin No. 279. It is a report of a series of investigations covering several years and touches such practical questions as the preparation of the land, laying of the contours, methods of throwing up levels or checks, construction of gates, discussion of the duty of water, the problem of drainage, the depth of water which gives greatest returns, and many other questions most practical and of interest to every rice grower. Write the University of California, Berkeley, for the bulletin.

"Lost, strayed, stolen, sidetracked, ditched, derailed, detained, abandoned or otherwise missing or restrained —one San Joaquin Valley summer." —Modesto Herald.

Lindsay will have another olive plant. It will be constructed by the California Olive Growers' Association.

Manager Niswander of the Peach Growers' Association says that packers will not suffer from the alleged shortage of tin.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Chicks Dying

Two and a half months old chicks stop eating and fall over as if they were partially paralyzed and die. No diarrhea. Feed chick feed and mash. They have fresh water all the time, also charcoal and grit. Run on alfalfa. No mites or lice. Had another hatch at the same time, fed them hard boiled eggs and rolled oats, kept them away from the others and some of them died. They are all on different ground from the old chickens. Have given them few doses of tobacco juice, thinking it might be worms, but find no improvement.—Subscriber, Clovis.

It looks as if something had poisoned these chicks. I wonder what disinfectant you have been using in your brooder and what time of the day you used it. If the chicks were shut up at night in a brooder that had been disinfected late in the afternoon with a strong carbolic disinfectant the fumes might poison them, but in this case they would show the effects of the poisoning early in the morning. Spoiled meat or beef scrap or moldy mash or chick feed might have the same effect. If the chicks are on range, they may have found a dead animal or chicken. It is up to you to find the cause and femove it. Examine their feed very carefully. In such damp weather as we have had this spring any feed that gets wet is almost sure to mold and that quickly. From the fact that so many chicks in different flocks have died the same way I feel quite sure the trouble is in the regular feed rather than the disinfectant or something they have picked up. It might be well to try buying your own ground grain and beef scrap and mixing your mash yourself. Prepared mashes are usually reliable, but one is not quite as sure of the quality of the beef scrap. Better let the tobacco alone. If there are worms you will see them in the droppings. The only treatment for the sick chicks is a good dose of castor oil or Epsom salts. This is most easily given in a little moist mash. If the chicks will not eat you can pour the oil down their throats, a scant teaspoon for each.—J. A. K.

Turkeys With Colds

Would like to know what is trouble with my little turkeys. Their eyes seem watery and I don't want them to be sick. Otherwise they seem all right.—Subscriber, Poway.

The article on "The Care and Feeding of Young Turkeys" in the Cultivator of June 2 will tell you what you wish to know, I think. Your turkeys are taking cold, but as I am not told where they sleep or what kind of ground they run on I cannot tell you just what the cause is. It may be they have not fresh air at night or that their coop is drafty or that they are sleeping on the ground instead of having a board floor under their feet, or that they were out in the rain some time, or that there are so many with one mother that she cannot hover them well. Young poults must be warm, and they must be dry, but they must have fresh air and good clean green range.—J. A. K.

Elderberries

What medicinal properties are contained in wild elderberries and what good use can they be put to?—Subscriber, Somis.

We know of none, that is, as to the berries. We note in Jepson's "Silva of California", regarding the common blue elderberry, which ranges from Washington to Southern California, the brewed bark is a folk remedy for dropsy, while the flowers are steeped as a favorite remedy by the native tribes of Southern California." So far as we know there is no commercial preparation from the elderberry. We may be permitted to remark, however, that the old time elderberry of the Middle West, which is a different member of this same family, has most agreeable medicinal qualities when made up into a good old time, home made pie and eaten for breakfast.

Bugs in Beans

Please advise method of treatment for pink and navy beans to prevent infestation by bugs. — Subscriber, Orange.

"Bugs" is a very indefinite term and we are not certain just what our subscriber refers to. If it is weevil, which lives within the bean, there is practically no method of control while the beans are growing. However, the infestation at this time is generally so slight as to be of little consequence. After the beans are gathered if they are subjected to the fumes of carbon bisulphide—one pint to 1000 cubic feet—in a tight room, bin or box, this will effectively destroy all weevil, but the beans must be afterward stored in insect proof warehouse or container to prevent further infestations. Use care in bringing a light near the fumes of the bisulphide, which is very explosive.

Fruit Trees from Seed

What kind of fruit trees can be grown from seed to bear fruit without budding or grafting?—Subscriber, Somis.

As to producing a fruit-bearing tree, almost every kind of fruit may be grown from seed, but as to growing a desirable variety of fruit, one for which there is a sure market, the only way is to graft the seedling over to fruits of known quality. There are practically none of our tree fruits which will produce a seedling equal to the parent tree. On the other hand, there are instances—possibly one in a thousand, where superior fruit may be produced.

Lightening 'Dobe

What is the best thing to lighten heavy adobe soil? Will coal ashes benefit?—Subscriber, Somis.

Yes, coal ashes would be excellent. Common sand is good. Straw, stalks or any coarse strawy manure or vegetable matter of any kind spread or plowed in are beneficial. With these might be used 1000 to 2000 pounds of air-slaked lime per acre, or ground unburnt lime rock.

Drinking Water

What is a good thing to take alkali out of drinking water?—Subscriber, Somis.

We believe there is no chemical which may be added to correct this alkalinity and still leave the water palatable and healthful. The only process we know of is that of distillation. The United States Department of Agriculture, Washington, D. C., has issued Bulletin No. 57,

Heap big mileage!
378726
Keyed-
Savages are "keyed" by means of serial numbers. And are distributed by our own organization, not sold to middlemen in huge quantities and carried in stock sometimes for a year or more.
We know just where a casing is and how long it has been there. The minute a tire reaches the the doubtful age, the point beyond which there is possibility of deterioration, it is replaced by a new casing.
You are always sure of getting live tires, full of "pep" and miles, when you buy

SAVAGE GRAFINITE TUBES
The only tubes that have graphite vulcanized into the surface. Prevents deterioration, sticking, friction and heating. Makes soapstone unnecessary. Lengthens the life of the tubes.

"Water Supply, Plumbing and Sewage Disposal for Country Homes," and in that is given a diagram for economical form of still. In referring to it the bulletin says: "Sometimes a simple still can be conveniently used on a kitchen range to provide distilled water for drinking purposes." The saline (alkali) waters are satisfactorily treated in this way.

Planting Chard

A subscriber in Los Angeles County writes that having had trouble in former years with chard going to seed she is now having better success in following the recommendation of an old German farmer who told her to "plant and re-plant when the moon was in the sign of the heart, represented by the lion." Those who "plant in the moon" may find this information of value, but the department of agriculture has generally advised to plant as early in the season as ground and weather permit without regard to signs.

Whitewashing Tree Trunks

I am contemplating whitewashing trunks of young prune trees with whitewash composed of two pounds salt, four pounds tallow and six pounds lime. Would this prove injurious to two-year-old trees in excluding the air from the bark or would the salt in any way affect the trees?—Subscriber, Calistoga.

We believe the whitewash referred to would only prove beneficial. However, one may secure protection from the sun by shading the southwest side of the tree with shake, board or even wrapping with newspapers or, even better, the tree protectors supplied by different manufacturers have proved very successful.

Windmill Lift

Please advise if a windmill of any kind will lift water from a bored well 220 feet deep? The water rises to about 60 feet of the top. The hole is six inches in diameter.—Subscriber, Sacramento County.

Any of the windmills in common use will lift water from the well described and in addition will lift it to a tank placed as tanks are ordinarily placed on farms. If a small wind wheel is used a smaller pump cylinder must be used, but an eight-foot wheel will handle a 2½-inch diameter cylinder having an eight-inch stroke if the prevailing winds have a velocity averaging ten miles per hour.—J. B. N.

Loss of Weight in Stack

Please inform me regarding the loss of weight of barley hay in going through the sweat in the stack? Most of the farmers in this section bale the barley from the field without stacking.—Subscriber, Highlands.

We will pass this question on to our subscribers. How much is the loss from stacking? We would suppose so far as the weight is concerned the loss would be very slight. Of course a greater amount of labor would be required than where the hay was bucked directly to the baler from the field.

Planting Beans

Will pink beans planted now on barley land mature by the middle of November, or before the frosts usually come in this section?—Subscriber, Highlands.

There is plenty of time to secure a good crop of beans. The main factor is heavy irrigation of land to put the ground in best condition before the seed is planted.

Hilling Potatoes

In cultivating potatoes where irrigation is necessary is it better to hill or leave level?—Subscriber, Banner.

We would by all means hill them, and partly for the reason that hilling gives better protection from the tuber moth.

Morning Glory

I enclose vine with blossom which is proving a serious pest in this section. What is it?—Subscriber, El Monte.

This is wild morning glory and, as the subscriber suggests, it is a serious pest, the best remedy for which is a good sharp cultivator or weed cutter. Make it a duty every week to go over the infested spots and use care not to drag particles of the roots to other sections of the orchard.

Sowing Alfalfa

We have four acres under irrigation. Can alfalfa be profitably sown next month or would it be better to wait until spring?—Subscriber, Chittenden.

If the season remains as cool as it has been to date it is possible that in a section like Santa Cruz County alfalfa could be sown in July. We believe we would prefer, however, to irrigate the ground as soon as possession could be had of it, plant to milo or some summer growing crop which would produce grain or feed for live stock, then sow alfalfa in the fall, or if the summer grown crop is not off in time then secure early planting of alfalfa in the spring.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.
Unsigned communications receive no attention.

Calves Dying

A few days ago I lost a calf about six weeks old that was sucking a heifer and was in fine condition. It was all right in the morning but was taken sick during the day. The ears got cold and it stood around for a time, then laid down and soon commenced breathing hard and groaning. It died about eight o'clock that evening. The next day we burned it. A couple of days ago I lost another one about three months old with nearly the same symptoms, except that it lived longer, was not quite so sick and seemed to choke when it died. Opening it we found the first stomach hard and filled with dry stuff. The next stomach was empty. This calf was fed milk and ran in the pasture with other stock. What do you think was wrong with them?—Subscriber, LeGrand.

The symptoms would indicate some kind of poison. Possibly a weed in the hay or pasture. With this suggestion you may be able to locate the trouble yourself.

Castrating Hogs

In cutting hogs I frequently have tumors form in those parts when they heal. It seems sometimes that when I am the most careful to disinfect and keep the parts clean during the healing period that I have the most trouble. Is there anything in the signs of the moon to cause this? I have never given it any consideration but can not understand why I have the trouble. I usually keep them on a cement floor while they are healing and keep the floor clean.—Subscriber, Owensmouth.

Nobody has ever been able to prove that the moon has any influence over the healing of wounds. The first pig I ever castrated was my own. My neighbor heard him squeal and, consulting his almanac, he hastened over to tell me that the sign was dead wrong and the pig was sure to die, but he never missed a meal and made a fine porker. Your trouble may be due to one of two things. You may cut the gash in the skin too high and leave a pocket for serum to gather in, or you may leave the cord too long. Cut the pocket clear out at the bottom and pull the cord out until it nearly snaps before cutting it off and you will have no more trouble.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.
Unsigned communications receive no attention.

Property of Husband and Wife

If a married couple have no children who are the husband's and wife's legal heirs?—Subscriber.

If the decedent leaves no issue, the estate goes one-half to the surviving husband or wife and the other half to the father or mother in equal shares, and if either is dead the whole of said half goes to the other. If there is no father or mother, then one-half goes in equal shares to the brothers and sisters of decedent and to the children or grandchildren of any deceased brother or sister by right of representation. The above applies to the separate property of the spouse. Upon the death of the wife all community property goes to the husband without administration; upon the death of the husband one-half of the community property goes to the wife and the remaining one-half is distributed as above described for the separate property.

CAMP FIRES MUST BE EXTINGUISHED

The first arrest reported this season for leaving a camp fire burning on a national forest was made by a forest ranger at Hemet on the Cleveland national forest. A camper from Los Angeles entered a plea of guilty before a justice of the peace at Hemet to the charge of leaving a camp fire burning and was fined $50 or 50 days in jail. Since this was his first offense the sentence was suspended and he was allowed to go on probation. The Hemet Valley derives its supply of water from large watersheds within the Cleveland national forest, and an unextinguished camp fire might result in a noticeable decrease of the now plenteous water supply, by destroying many acres of brush and woods.

Those found guilty of causing fires in the national forests this summer will be prosecuted to the fullest extent of the law. The damage done by fires to the much needed forage of the forests is often more than the damage done to the timber or stream flow, and this season every acre of forage is needed for the stock which have been crowded on to the national forests in the campaign to increase the nation's meat supply.

The much dreaded forest fire season may be later in starting this year than usual since reports from the supervisors of the 18 national forests in California all emphasize the unusually damp and cool weather.

NEXT ORANGE SHOW

The California citrus growers are getting ready for the 1918 National Orange Show which will be the eighth annual to be held in San Bernardino. The dates chosen are February 20-28.

It is nothing unusual for Norwalks to give as high as 20,000 miles of perfect service, and few fall less than the 10,000 mark. Immediate deliveries made in all sizes.

Raise More Corn and Less Water

IT sometimes becomes necessary to do heavy work, such as hauling water to put out fire, but what's the use of hauling water from the cornfields to the feed lot, and hauling it back again to the fields in the shape of uneaten cornstalks? Very tall-growing corn when sappy and immature is almost all water and so is wet cornstalk manure.

It used to be that many growers prided themselves on the great height of their cornstalks. The more successful farmers, however, have ceased to haul water from the cornfields to the feed lot in the form of coarse stalks which remain uneaten and haul it back to the fields in the shape of wet cornstalk manure. They do not grow such tall stalks and often profitably allow animals to gather the grain, leaving the stalks in the fields to enrich the soil.

A few years ago silage was thought to have a fixed food value. One cannot take out of the soil any more food value than is put in. Hauling and siloing large sappy stalks is heavy work and not as profitable as putting a good, almost mature corn crop into the silo. A somewhat larger and later maturing variety of corn that will thoroughly mature for grain can be used in the northern states for ensilage. Even silage corn should be planted early and given sufficient time to make its best growth and reach the stage of maturity at which husks turn brown and the ears become glazed.

A cooperator in the Department's corn work grows a high-yielding variety of corn, the stalks of which reach a height of about six feet, while his neighbor grows a big, 12-foot variety. In helping each other shred their crops, the neighbor's tall-growing corn was shredded first. The stalks were bulky and high loads were hauled from the fields to the shredder. When beginning the shredding of the competitor's corn, which that year produced over 100 bushels of dry shelled corn per acre, the neighbor put on the accustomed high load, and his team could not pull it out of the field. He got down off the load to make an examination, thinking the rack must be pressing against the wheels. The competitor told him he would have to take off a part of the load, to which he replied that he did not have on a big load and was accustomed to hauling larger loads. After being convinced that it was the weight of the load that stalled his team, they removed a portion and hauled the balance to the shredder, from which they obtained 40 bushels of corn, or almost a ton and a half of ears.

What variety of corn should you plant? Since there are thousands of so-called varieties, it is not possible to designate by name the variety you should plant. Furthermore, with corn, there is very little in a name. Two lots of seed of the Leaming variety sometimes differ from each other more than two varieties differ from one another. An accurate test of two different lots of the Boone County White variety resulted in one lot producing 18 bushels more per acre than the other lot. Quality is what counts and the varietal name does not designate quality. Plant a variety that has made good in your neighborhood. Plant seed which was grown in your part of the state and was properly field selected and properly cared for during the winter.

Overhaul Your Own Car

"Before beginning the overhauling of the car," says Wayne Higgins in the National Stockman and Farmer, "it is a very good idea to provide a liberal quantity of the following: Gasoline, motor oil, kerosene, cup grease, transmission greases, cotter pins, assorted nuts and washers and a complete tool kit, all of which can be found at any good supply house at reasonable terms.

"Beginning at the front of the car at the wheels they should be removed and both sets of bearings and spindles thoroughly washed with gasoline and wiped dry with waste. If worn they should be adjusted, repacked with a good grade of medium grease and replaced, being sure to get the locknut in position, also the cotter pin, using a new one if necessary. Next the springs should be separated and a thin layer of graphite placed between leaves, to give resiliency and prevent squeaking.

"Next we will go to the motor. If the car has not been run over five to ten thousand miles it will not be necessary to take it down. However, if the flywheel shows play when grasping it and trying to rock it sideways the cylinder block should be removed and the bearings tightened by removing one or more of the thin shims and retightening the nuts. The crank case and oil reservoir should be drained and thoroughly washed out with kerosene or gasoline. The cylinder head, combustion chamber, etc., should be thoroughly scraped to remove all carbon deposits, the valves ground in till a thorough seat is secured. Put new oil in crank case.

"The radiator and water cooling systems should be inspected. If radiator leaks it may be soldered, or if slight leaks occur in the tubes it may be repaired by using some of the many preparations on the market.

"The universal joints, transmissions, differential, etc., should be washed out with gasoline and repacked with new grease. The wiring of the car should be thoroughly gone over and repaired if any breaks occur. The brushes on the commutator of the generator and starter motor should be replaced if badly worn. The commutator should be brightened by pressing a piece of emery cloth on it while running. The connecting terminals on the storage battery should be brightened before connecting to the system or it will not operate the starter properly. Do not forget to add distilled water regularly to the battery.

"If any new parts are needed do not fail to order them now, as when the season is in full blast and you are very busy with other things you do not want to lose a week, or so long as it takes to get and install a new piece on your car. The things most likely to need replacing are tires, gum hose for radiator, fan belt, demountable rim lugs, carbon brushes for generator, links for speedometer chain, fiber pinions for same, dry cells, spark plugs, steering gear bearings, bushings, electric light bulbs, etc.

"The gasoline tank and line should be inspected to see that there are no leaks. Have the car thoroughly washed and if the paint is good have it given a coat of good varnish. Brighten up the seats and top with a coat of seat and top dressing, let these thoroughly dry and set, and your car will run and look as well as ever."

STANDARD OIL COMPANY (California)

RED CROWN GASOLINE

SAVE EXPENSE

Be a business farmer—use time saving devices — make more money out of your land, your labor, your time.

The Yuba Ball Tread Tractor plows deeper, quicker, at less expense — harrows, discs and cultivates at the time when the soil needs it most—it gets the job done.

There's greater demand for food—you should take advantage of it and cultivate more acres better and quicker—make hours count for days.

Write for the Yuba Ball Tread Tractor catalogue—telling us how many acres you have.

Are Prices High?

An Eastern writer has written the following regarding the purchasing power of some products. Possibly slightly overdrawn but in it is a suggestion that this is a time for producing to the limit of the things the world wants. Buy more labor saving implements, more fertilizer and feed the world.

At prices of a year ago it would have taken 50 bushels of wheat to buy a liberty bond; today one can be bought for 25 bushels.

Last year a farmer could build a silo for the price of 800 bushels of corn; today he can build the same one for the price of 400 bushels.

Last year it cost a community the price of 16,000 bushels of wheat to build a mile of permanent highway; today a mile can be built for 8000 bushels.

Last year a farmer had to raise a thousand bushels of wheat to buy the tractor with which to till his field; this year he can buy two tractors for the same amount.

Everybody should buy a liberty bond.

Was there ever a more favorable time to build a silo, to buy a tractor, to build permanent highways?

Now is the time to exchange your farm produce for these necessities.

By doing this capital will be created and placed in circulation. Prosperity will be stimulated, labor kept employed at good wages. The dollar will be kept rolling and more of our citizens enabled to perform their patriotic duty to buy liberty bonds.

Let us keep on making, selling, transporting and building.

Lessen the Fire Loss

By Coert Du Bois, District Forester

Never in the history of our country has there been a more urgent need for fire prevention than at present. Twenty-five million dollars is the average annual loss in the United States in mature timber from forest fires. Add to this the loss of private property, grain in the field, foothill range, mountain forage, and productive labor used in fire fighting, and the total might well become a serious factor in the present emergency.

California's share of this loss must be reduced to the minimum this summer. Every sack of wheat, every acre of stubble or mountain range, and every hour of labor must be put to war use. The man who is careless with burning matches or tobacco or who leaves a campfire burning may not realize it but the results of his carelessness may give aid and comfort to the enemy.

* * *

To the above Benj. Ide Wheeler, chairman of the committee on resources and food supply of the state council of defense adds:

"At this serious time every patriotic citizen has two distinct responsibilities, the prevention of waste and a contribution to the increase in the food supply. Here is a way in which everyone can help meet both:

"Fires in the forests, the grass and brush lands, and the grain fields, such as occur annually in our California dry season, cause a loss of grain, of forage for cattle and sheep, and of wood and timber. We have become used to such fires and take them too much for granted. This year any fire burning uncontrolled means a loss in resources, money, and labor that are needed for building ships, feeding people and live stock, and planting and harvesting our crops.

"The cooperation of very loyal citizen is urgently requested, both in the matter of scrupulous care with fire in the open and in urging care on others."

A new grain warehouse is being erected at Dallas, Oregon, by the Farmers' Union.

A LIVE FARM BUREAU

By Jas. Little

We have a real live bureau of 140 members here at Wasco. We started the first farm center auction sale in the state. Haye had four sales in four months which have brought the ranchers between $7000 and $11,000 each sale. Top hogs today brought $14.05 per hundred, all bought by a San Francisco firm today. Horses, cattle and machinery brought good prices. Our own local auctioneer, O. S. Grant, made a great hit (as it was his first sale here at home). We have our own stock scales just installed. Have a purchasing committee which buys such stuff as feed, seeds, cement, posts, wire, etc., in carlots at a great saving to the ranchers. We have our own farm center brand, the only one of its kind in the state, and a dandy, too.

ALL BELLIGERENTS REPRESENTED

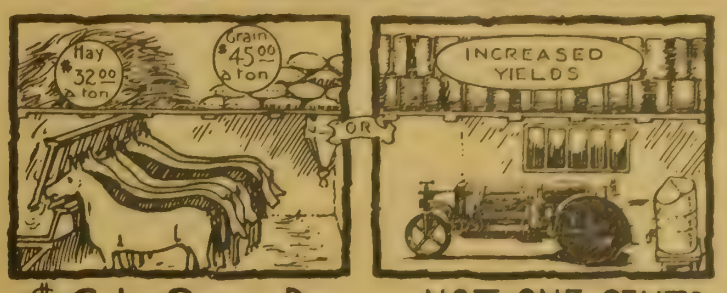
Customer: "I would like an order of German frankforts, a cup of English breakfast tea and two French rolls."

Waiter (to the cook): "One war on a tray."

Customer: "Please add two doughnuts to my order."

Waiter: "Throw in a couple of U-boats."

Which?



$ 6. to 8. PER Day NOT ONE CENT!

During the Summer

the Samson Sieve-Grip Model S-25 can save you from $6 to $8 every day it does not work!

The number of horses replaced by this tractor would cost that much to feed every day, whether working or not.

Start making this saving RIGHT NOW by using a

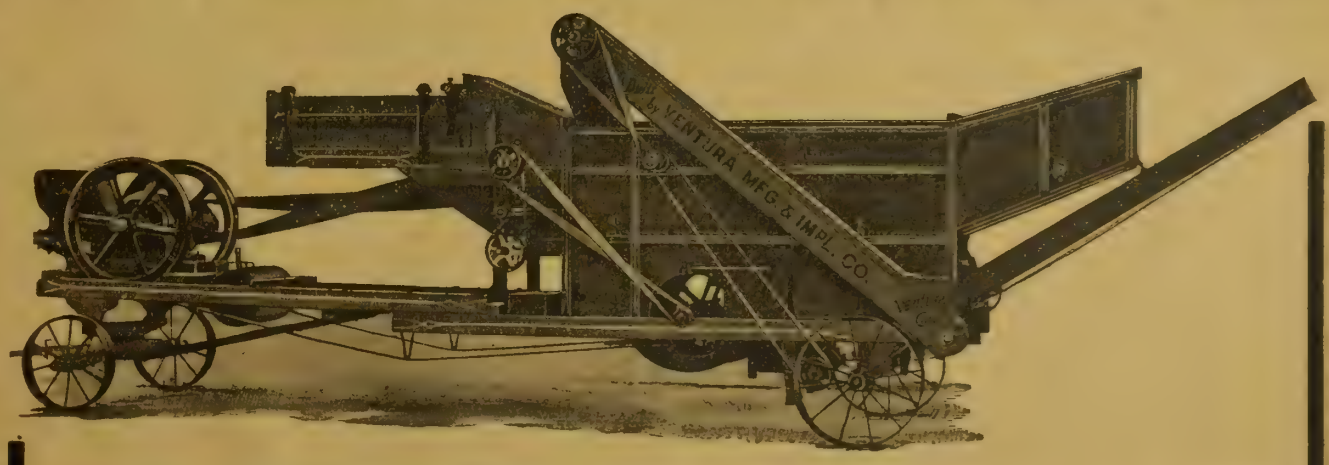
The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

Every Bean Farmer is Interested in this



There was a time when the bean growers of California tramped out their valuable bean crop on a threshing floor. Through years of patient toiling and the application of scientific principles William Hamilton, mechanic and inventor, patented and manufactured the Ventura Bean Thresher. The production of this machine has been to the bean industry what the reaper was to wheat. For twenty-one years our threshers have given universally satisfactory service. Beginning with one machine we now offer six sizes.

The Ventura Bean Thresher Junior No. 2

is now offered for the farmer who desires to do his own work in his own time. The Junior No. 2 also is large enough for a neighborhood thresher to supply the needs of several farmers with relatively small bean acreage who may be unable to wait for service from the big machines. The Junior No. 2 is the best machine in the various types now on the market. It has its own power (also without power), is substantially built, and has all the successful construction that has made our larger machines supreme in the bean threshing line. The price is within the reach of all bean farmers. It can be operated with a minimum of ten men and possessing a thresher like this you can thresh when the best opportunity is offered. Capacity 150 to 300 sacks per day. You cannot afford to take chances on bean crop losses when prices are so good when you can save your crop with a machine like this. There is a greatly increased bean acreage this year and a shortage of materials. Orders will be filled in the order received. **Place your order early or you will be disappointed.**

Ask your nearest dealer or write to us about it now. Free catalogue on request. We manufacture a full line of bean and beet tools.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Next Thursday, June 14, is the anniversary of the official adoption of the United States flag, the date being June 14, 1777, the first flag having 13 stripes and 13 stars in the union. The stripes remain as in the original flag, but the stars have been increased year by year until there are now 48.

Preceding this flag were many designs, each of the original 13 states having its own emblem. Who designed the one which was finally accepted it is impossible to say, in fact, it is more of a growth than a creation by any one. It is worthy of an anniversary day, and for several years June 14 has been observed. The observation of the day will doubtless be more general this year than any preceding year.

PEACHES

The Eastern peach crop promises a light output this year. It was a hard winter and California will be called upon for what now appears to be an exceptionally large crop. It is perhaps late for thinning, but every effort should be made to make this crop one of exceptional quality. The Associated has the business end of the situation well in hand, and every peach grower should anticipate and plan for a most prosperous year.

PAY FEDERAL TAXES

The commissioner of internal revenue calls attention to the great drain upon the federal treasury at this moment and urges prompt payment of taxes. These may not be due for some weeks and the commissioner has no power under the law to make any rebates or discounts on such anticipated payments, but hopes that in view of the conditions a large response may be given to the request for these early payments.

LEARNING THE ORANGE

Several sales agents of the California Fruit Growers' Exchange are in California studying how oranges are made, how they are harvested and packed, and how they are shipped in dozens of train loads every day. They have been selling to Eastern consumers a fruit which to them is more or less strange in its way of growing and its time of harvesting. They can talk to customers more intelligently after they have met the people who are doing the growing, the packing and the handling of this, California's greatest industry.

COOPERATE

Many who become members of cooperative organizations look at the organization much as some people look at our government, that is, as something apart from themselves. This class of people feel that the state or federal governments are external organizations which should give of their great wealth to the less fortunate of the people. As one has said: "He fools himself (but no one else) who expects to work in a cooperative society and not give as well as receive." Ignoring the law of cooperation is wherein many organizations and their members have failed.

GROW CHICKENS

With wheat at six cents a pound the poultryman is looking at life as "simply one thing after another", and asking where the next meal is coming from. Fortunately prices for poultry products have been slightly higher than preceding years, but even then the shrewdest buying has been necessary to keep his business going. Males have been marketed as soon as they could be dispensed with; as summer time approaches the layers are being sent to market in immense quantities; but the wise poultryman will bear in mind future needs and future opportunities and keep the stock for a time when feed may be had at more reasonable prices. There will be no low prices of any cereals for the next 12 months, but we trust the prices will be such that the poultryman may at least have some opportunity for profit.

Meantime grow sorghum grains and plan for a big "crop" of poultry to meet the country's demand for more food.

FROST FIGHTING

Pomona is awake in the frost fighting investigations. Preparedness is her slogan and she wishes her preparation to be not only effective and economical but as devoid of objectionable features as possible. Hence "frost fighting tests", "smudge pots", gas heaters, electric heaters, every kind of heater is to be given practical orchard test during next week.

It's six months till possible frost time but the citrus growers need every moment.

The Chamber of Commerce of Pomona is the moving body in this preparation. The dates set for the test are the nights of Tuesday, Wednesday and Thursday of next week, June 12, 13 and 14. The test will be in an orchard on San Antonio Avenue near Holt.

C. N. Burton is chairman of the committee having matter in charge and announces that a practical working test of the various heaters will be made. About 20 types of heaters will be tested and several hundred will enter. "More heat and less smoke" will be the slogan.

MY FLAG

Observe the fifth word in the flag salute on the cover of this issue of the Cultivator. "Our" Flag is good, but "My" Flag, in the most generally observed flag salute is still better; it indicates a more personal relationship.

But let not this personal feeling lessen our reverence. We have seen some uses of the flag which must have a tendency to lower respect for it. Its use in advertising and attracting attention for selfish reasons has been taboo for some time so that it is little used in this way now, and it is a satisfaction to see the general use in homes, on flag poles and on autos.

In this latter use, however, we have seen a case which is worthy of criticism, we believe. We noted one machine with four flags, three, perhaps entirely properly used, on the front, and one attached to the rear axle, hanging almost to the ground, dusty, with an occasional oil spot and splash of mud. It was a most sorry sight. We think the intention of the driver was to honor his flag, but the position in which he placed it was not so taken by observers.

Let us display our flag in every place of honor.

BOUGHT YOUR BOND?

France with a population of 39,000,000 and a total wealth of $60,000,000,000, and Germany with a population of 68,000,000 and a total wealth of $103,000,000,000 and Great Britain with a population of 46,000,000 and a total wealth of $81,000,000,000 have each appealed to their people for well up toward a score of billion dollars to conduct the war. The United States with a population of approximately 101,000,000 and a total wealth of $206,000,000,000, or almost as much as the three countries mentioned, is now asking us to subscribe, and as quickly as possible, $2,000,000,000 in the liberty bond issue. We are all writing and talking and waving flags and urging more liberal signing. Meantime the signing up continues, but not as swiftly as it should.

This is not the time for discussion of politics or reasons of the war. We are at war with the most powerful military organization in the world. We should show to the boys who are asked to go into the trenches against such a nation that instant support of the war will be given by the "stay-at-homes". This $2,000,000,000 of bonds should be oversubscribed many times. The moral effect would mean the saving of thousands of lives and the quicker end of the war.

As the president has said "We have no selfish ends to serve. We desire no conquest, no dominion. We seek no indemnities for ourselves, no material compensation for the sacrifices we shall freely make. We are but one of the champions of the rights of mankind."

The American people abhor war, and were it not for the hope that our entrance into this war may be a help toward an everlasting peace we believe we would not be in it. Then let our fight be with all the energy at our command—as to brains, muscle and capital. Every one of us can "Do our bit."

Agricultural Notes

Tillman County, Oklahoma, has a County manager.

The almond crop of Eastern Sicily is only one-third that of 1916.

Banana flour as a substitute for wheat or potato flour is now suggested by chemists.

The crop of onions in Egypt is much smaller than usual and not in satisfactory condition.

The entire world's crop of wheat this year is one-fourth less than last year's according to reports received and compiled by the international institute of agriculture at Rome.

Denmark on February 20, 1917, took a special census of live stock and, contrary to expectations, the result of the investigation indicated that the number of animals had not decreased.

The general manager of the Pacific Fruit Express estimates that 9950 cars will be required to handle California's cantaloupe crop this year, and 79,700 tons of ice will be used in icing the shipments.

A committee has been appointed by the Argentine government to prepare a plan for a campaign against the locust pest in that country. The locusts did serious damage to the cereal crops in many sections last season.

Switzerland's 1916 crop of potatoes was a failure, therefore the government on March 12, 1917, empowered cantonal and municipal authorities to require owners and renters of land to plant certain areas to potatoes.

During the current season the United States bureau of fisheries will maintain a field station on the Salmon River, Idaho, to collect eggs of the early run of chinook salmon, which has the highest commercial value of any of the salmon entering the Columbia River.

Canners of tomato paste in Italy are embarrassed by shortage of tin. There is thus a probable shortage of output for 1917 as well as a probability of increased prices. Exports of paste to the United States from the one port of Catania increased to 130,337 for 1916, from 24,715 pounds for 1915.

The acreage of potatoes on May 1, 1917, the United States over, was 281,700 as compared to 242,900 in 1916. The condition is indicated by the statement that it is 86 per cent of normal and from that the deduction is made that the total production this year will be 33,516,000 bushels as against 26,481,700 bushels in 1916.

Shortage of food for animals in England threatens to put cattle, horses, swine and poultry on compulsory raticns. President Prother of the board of agriculture says: "In the present national crisis it is necessary to bring in human food rather than raw materials for food such as feeding stuffs for live stock, which can only be converted into a much smaller weight of human food.

Vancouver, British Columbia, is plowing vacant lots at cost for gardening because of the high price of seed. Many are trying the method of using most of the potato for the table and saving the end that contains the "eyes" with just enough of the flesh to constitute little more than a good thick peeling. In this form of planting a few more of the "eyes" are placed to a hill so as to allow for some not sprouting.

Agricultural News Notes of the Pacific Coast

Northern California

Pear growers of Napa County expect a 100 per cent crop.

The girls of the Gridley high school have organized a canning club.

It is estimated that 3000 acres of sorghum have been planted in Yolo County.

The Mt. George farm bureau enjoyed a picnic at the Coombs Ranch on May 19.

The farm adviser of Napa County is making a post card labor survey of the county.

Yolo County farmers report offers of two cents for their 1917 barley and $15 for alfalfa.

The first forest fire of the season, covering about 30 acres, is reported from Glenn County.

The new fruit standardization bill passed by the legislature has been signed by Governor Stephens.

Dean Van Norman of the university farm at Davis addressed attendants at the Mt. Vernon farm bureau picnic Saturday, May 26.

The Glenn County farm bureau announces June meetings at Codora on the 12th, Jacinto 15, Orland 19, Plaza 22, Elk Creek 25.

Rice farmers of Yolo County are suffering damage from crickets. The only successful way discovered to get rid of the pests is by drowning.

J. J. Fox has resigned as horticultural commissioner of Napa County, to assume duties of appraiser with the federal land bank at Berkeley.

A cloud of grasshoppers are said to have assembled in Butte County between Oroville and Chico. Orchardists are adopting preventive measures.

The state department of engineering has reported as feasible the proposed Scott Valley Irrigation project in Siskiyou County, comprising 5558 acres.

The committee on resources and food supplies of the State Council of Defense is urging that potatoes be allowed to mature and not be used as half grown new potatoes.

On complaint of a resident of Willows a band of 200 goats which had invaded his place was taken up by the poundmaster and held awaiting disposition by their owner.

There will be farm bureau meetings in Sacramento County at Orangevale June 11, Fairoaks 12, Elk Grove 14, Cosumne 15, Carmichael 19, Hood 20, Franklin 22, Sacramento 23.

Several breed meetings were held at Davis the last two days of May. The California Draft Horse Breeders and the Hereford Breeders met on Tuesday, the State Swine Breeders on Wednesday.

Delegations of farmers from various sections of the Sacramento Valley went to Sacramento to be present at the hearing by Governor Stephens of the Polsley bill. The provisions of this bill exempt practically all of Butte County from the Sacramento and San Joaquin drainage district.

With a view to the completion of California's highway system the advisory board of the state engineering department has requested Governor Stephens to instruct the state treasurer to proceed with the necessary preliminaries for the sale of $5,000,000 worth of the bond issue voted in 1916.

Central California

Nine new packing houses are now in prospect for Lindsay.

"Plant sorghums" is the general advice being given on all sides.

Picking of Valencia oranges will start in Tulare County early in June.

Sequoia and General Grant national parks were opened to the public May 21.

The Tulare Cooperative Poultry Association reports doing an $18,682.95 business in the month of April.

The question of water transportation for the Fresno section was discussed at the recent Commercial Club meeting in Fresno.

The campaign to carry through the $9,000,000 Pine Flat irrigation project is being continued in Tulare, Kings and Fresno Counties.

Tulare creameries paid out more than $138,000 for butter delivered during April. This is $28,000 more than paid for March deliveries.

Lindsay is to have another large olive packing plant built during the summer. This will be erected by the California Associated Olive Growers.

S. R. Squibb, secretary-treasurer of the California Farmers' Union has been elected secretary-treasurer of the Prune and Apricot Growers' Association.

The Dairymen's Cooperative Creamery Association and the Tulare Cooperative Poultry Association held their big cooperative picnic at Mooney Park on May 31.

Twenty-two grape growers have been granted judgments against the California Wine Association for refusing to carry out contracts for buying wine grapes in 1915.

Meetings of the San Joaquin County farm bureau are announced for June 4 at Thornton, 6 Farmington, 11 Lockeford, 13 Linden, 14 Bellota, 15 Manteca, 18 Escalon, 22 Ripon.

The San Joaquin Valley demonstration train has been sent out on its Eastern tour, making its first stop in Kansas. The train was held for several days in Fresno to be given its finishing touches.

The great Woodward dam of the South San Joaquin irrigation district was christened May 18. More than 11,000 people were present to witness the services and 2000 autos were parked beside the dam.

Managers of the Fresno district fair have arranged for two monster tents for the housing of machinery and auto exhibits. Three thousand four hundred and fifty dollars has been appropriated for cattle prizes.

The Tulare County Cow Testing Association has raised the standard of its roll of honor to production of 50 pounds butter fat instead of 45 as so many cows are coming above the 45-pound test. April's roll of honor shows 28 cows producing over 50 pounds.

The new farm adviser of Merced County has announced a regular schedule of local meetings: First week of each month—Monday, Dos Palos; Wednesday, Cottonwood (Ingomar and Gustine); Friday, Planada. Second week—Monday, Stevinson; Wednesday, Irwin; Friday, Delhi. Third week—Monday, Livingston; Wednesday, Winton; Friday, Amsterdam. Fourth week—Monday, Merced; Wednesday, El Nido; Friday, LeGrand.

Southern California

San Bernardino has organized a local farm bureau.

Bean aphis are showing up in the Santa Barbara fields.

Brawley is shipping its first tomatoes to the San Francisco market.

E. H. Erickson of Brawley is making heavy daily shipments of apricots.

The cantaloupe acreage of the Calipatria district is double that of last year.

San Luis Obispo County reported on June 1 practically all bean acreage planted.

It now looks as if the government's army concentration camp will be located at San Diego.

Beaumont's cherry crop is several weeks later than usual but shipments are now going forward.

Contracts for lima beans are reported being made in Ventura County as low as six cents per pound.

Warning has been sent out by the government that the crest of the Colorado River will probably reach Yuma on June 1.

All former residents of Maine in Southern California are invited to a big all-day picnic in Sycamore Grove, Los Angeles County, on June 9.

June 22-24 will be the dates of the Friendship Fiesta at San Diego when Governor Cantu of Baja California will participate with Californians.

The California Milch Goat Association held an exhibition at Pasadena on May 26. The president of the association is Dr. G. Roscoe Thomas of Pasadena.

The Colton Fruit Exchange of Colton received word from England of the sale of a carload of oranges averaging $3.30 a box. Previous carloads averaged $3.80.

It is estimated that the California Lima Bean Growers' Association will this year control between 350,000 and 400,000 bags. The 1916 crop is practically cleaned up.

A petition will be submitted to congress for appropriation of a half million dollars to irrigate 30,000 acres adjacent to the present Palo Verde Irrigation District.

Manager Shipley of the California Lima Bean Growers' Association has resigned, his resignation to take effect July 1. A successor has not yet been chosen by the directors.

Cool weather has held back Imperial Valley's cantaloupe crop. It will probably be the middle of June before any quantity of Imperial cantaloupes reach the Eastern market.

Dairymen and stock breeders from all over Southern California gathered at Stalder Brothers' Rosamond Farm near Wineville, Riverside County, May 21, for the auction sale of Percherons and Holsteins.

At the recent annual meeting of the Beaumont Fruit Growers' Association the following directors were elected for the coming year: N. C. Beebe, W. J. Dwyer, William Mohr, R. N. McCahan, R. D. Rosenberger, K. R. Smoot and R. L. Wilson.

The American Beet Sugar Company has announced a new schedule of prices for this season, based on $4.50 per ton for 15 per cent beets, with additional payments for high sugar content and for increased net price of sugar over four and a half cents.

The Coast

Salt Lake plans to have a municipal market.

Nampa, Idaho, will hold its Harvest Festival September 17-19.

Farmers of Star, Idaho, have drawn up plans for a cooperative warehouse.

Sicilian lemons are meeting a poor market in eastern ports of this country.

Convicts of New Mexico will farm a 1000-acre ranch in Torrance County.

A sale of 40,000 pounds of wool is reported from Boise, Idaho, at 52½ cents a pound.

Washington County, Idaho, has organized farm bureaus and will have a farm adviser appointed.

Farmers of American Falls, Idaho, are planting beans on land where wheat was winter-killed.

As insurance against a possible hay shortage many Idaho farmers are building silos and planting the corn to fill them.

The Columbia County, Oregon, Fair Association has changed the date of its fair from September 26-28 to September 19-21.

The crop report of the Southern Pacific Railway shows crops in the Willamette Valley of Oregon to be in tip top condition.

Hermiston, Oregon, reports fruit trees well loaded with fruit and berries and vegetables making an unusually good showing.

From Custer County, Idaho, comes the sad plaint: "The farmers here would be glad to build homes for hands, but there are no hands."

Bloom in the apple orchards of the Wenatchee district of Washington was three weeks later than usual this year. Indications now are for a heavy crop.

Many sales of wool at 50 cents per pound and over are reported in Oregon, Montana and Idaho, but wool owners are inclined to hold for still higher prices.

A contract to furnish the government with 30,000 pounds of butter at 45 cents a pound has been awarded to the Linden Creamery of Bellingham, Washington.

Farmers of Monroe, Washington, have organized a sale association, holding sales on special market days of live stock, machinery, harness, household supplies, etc.

Farmers of Willcox, Arizona, are discussing advisability of building a cooperative warehouse. Farmers of Pearce are also planning to build a cooperative warehouse.

It is estimated that the strawberry crop of the Kennewick district of Washington will be about 75,000 crates this year as against 50,000 last year. The crop is nearly a month late.

The last legislature of Colorado passed cantaloupe standardization laws. Under the provisions of the bill a state inspector is appointed with assistants in the various cantaloupe raising sections.

The enrollment period for grain sorghum clubs, being formed by the agricultural extension department of the University of Arizona, has been extended to July 1. Each contestant is required to grow at least one acre of sorghum.

Get Rid of Worms!

Many animals, especially hogs, are troubled with worms. When your hogs are unthrifty, you hear a little cough now and then, suspect worms.

Dr. Hess Stock Tonic

Keeps Hogs Healthy **Expels Worms**

So sure am I that Dr. Hess Stock Tonic will keep your hogs healthy and expel the worms, that I have authorized my dealer in your town to supply you with enough Tonic for your hogs and, if it does not do all I claim, just return the empty packages and get your money back.

My Stock Tonic is not a feed, but a true conditioner and tonic, highly concentrated, which contains blood purifiers, laxatives and drugs which are powerful worm expellers. Feed in small quantities, watch your hogs improve.

NEVER PEDDLED. SOLD ONLY BY DEALERS.
28,000 reliable dealers in U. S. handle it. Why pay the peddler twice my price?

25-lb. Pail, $2.25; 100-lb. Sack, $7.00

Smaller packages as low as 65c. Valuable stock book mailed free, if you write for it.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Instant Louse Killer A reliable lice killer, very quick acting. For use on poultry and stock. Use by dusting and sprinkling. Destroys bugs on cucumber vines, cabbage worms, slugs on roses. In handy sifting-top cans. 1 lb., 25c; 3 lbs., 60c. *Guaranteed.*

Write Dr. Hess about any sick animal or live stock trouble, enclosing 2c stamp. He will advise you free.

Santa Anita Rancho
Anoakia Breeding Farm

ARABIAN THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three-year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars. Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

State Dairy Cow Competition

THE following cows produced over 40 pounds of butterfat during April, 1917. Name of owner is given first, then list of cows with performance. The abbreviations Gr., Ay., G., H., J., stand for Grade, Ayrshire, Guernsey, Holstein, Jersey. The first figures indicate age (where age is not given it is indicated by dash). For instance, "Mabel Haskins Colantha Girl H. 4-2" means that animal is a Holstein aged four years and two months. The next figure (33) indicates number days in milk at beginning of month; the next (2319.9), production of milk in pounds for the month; the next (3.86), percentage of fat; the last (89.548), pounds fat for the month.

Abbot, K. W.—Mabel Haskins Colantha Girl, H., 4-2, 33, 2319.9, 3.86, 89.548; Zaza, Gr. H., 6-18, 1584.7, 4.25, 67.350; *Blossom, Gr., —, 5, 1373.8, 3.51, 60.997; Colantha, Gr., 6, 39, 1630.0, 3.55, 57.865; Birdie, Gr., —, 24, 1743.8, 3.28, 57.197; Molly, Gr., —, 18, 1602.7, 3.55, 56.896; Melba, Gr., —, 117, 1712.9, 3.31, 56.697; Riverside Beauty 2d, H., 8-7, 114, 1266.4, 4.35, 55.088; Carrie, Gr., —, 14, 1567.8, 3.45, 54.089; Rilla, Gr., —, 170, 1441.8, 3.72, 53.635; Norma, Gr., —, 5, 1410.4, 3.74, 52.749; Nellie, Gr. MORE CREAM LESS LABOR

Through Using a

NEW DE LAVAL

CREAM SEPARATOR

PATRIOTIC DUTY as well as dollars-and-cents self-interest now demands of every cow owner the saving of every ounce of cream and butter-fat.

Likewise the saving of time that is possible through a cream separator of ample capacity, that is easily turned and always in order.

There was never a summer in the history of the country when both these considerations were of as great importance to the nation as well as to the individual producer of cream and butter.

Under present circumstances, a modern De Laval Cream Separator will save its cost every few weeks. Every cow owner owes it to himself and his fellow countrymen to effect this saving.

This is true whether you have no separator or have an inferior or half-worn-out machine, even if it be an old De Laval model.

It is important to remember, too, that if you cannot pay cash for a new De Laval machine, you can buy one on such liberal terms that it will actually pay for itself while you are using it. Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for new catalog or any desired information.

Every New De Laval is equipped with a Bell Speed-Indicator

Another Successful Sale

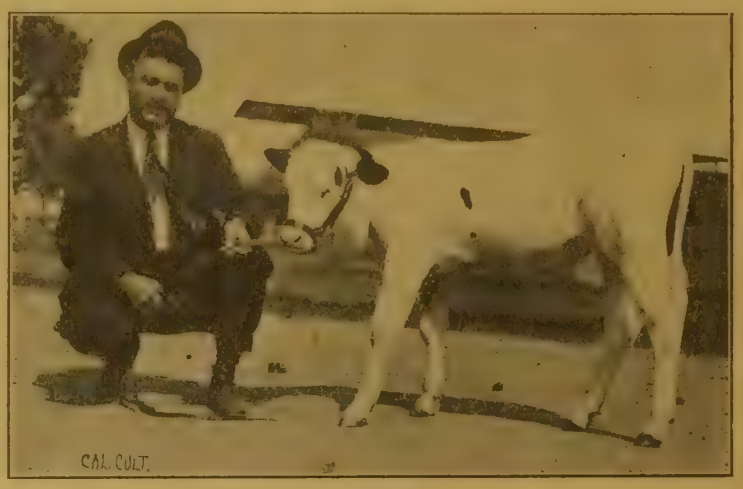
Written for California Cultivator By C. A. Briggs

MAY 31 was the day, Sacramento the city, and the state fair ground the place. The occasion was the second Sacramento sale of registered Holsteins by the California Breeders' Sales & Pedigree Company. Sixty-four head sold for $15,075, an average of $235. The leading lady was Spring Farm Cornucopia Ormsby, a fine typey two-year-old heifer consigned by the Bridgford Company of Knightsen. Starting with a bid of $800 by J. M. McAlister of Chino a spirited three cornered fight between McAlister, Gotshall & Magruder and Guion Gibson carried the figure up to $1400, at which price she was knocked off to Gibson. After the sale Mr. Gibson resold his bargain to Gotshall & Magruder at an advance of $250. She is in good hands and will surely be heard from among the record makers. The Bridgford Company's string of 11 head not alone topped the sale with this animal but also brought the largest average consignment price, $444. Other consignors were Henderson Company, Sacramento; Frank Hatch, Modesto; Palo Alto Stock Farm, Palo Alto; Toyon Farm, Los Altos.

Fifteen buyers kept Colonel Ben Rhoades and his son on the jump. Those who secured animals were: W. H. Calhoun, Healdsburg; Gotshall & Magruder, Ripon; J. P. Phillips, Fresno; H. E. Cornwell, Modesto; Napa State Hospital; Kaiser Bros., Ceres; Bonita Stock Farm, Lodi; C. C. Lester, Gilroy; Geo. P. Robinson, Sacramento; C. F. Silva, Sacramento; A. E. Greene, Hood; Chas. Yocum, Tulare; S. G. Kounias, Modesto; R. C. Gruhlke, Dixon; A. C. Holly, Dixon.

Top Notch Heifer

E. A. Bridgford holding a two-year-old, one of the top notchers at the Sacramento sale May 1. This is Spring Farm Cornucopia Ormsby, consigned by Bridgford Company and sold to J. S. Gibson Company for $1400. After the sale she was resold to Gotshall and Magruder for $1650.



Some Calf

A bull bought by George Kounias for $425. He was consigned by Toyon Farms.

At noon a dandy lunch was served. C. L. Hughes managed the sale and genial "Charley" Paine, state fair secretary, managed to make everybody happy. Sellers were satisfied and buyers sure that they got good money's worth.

Roughage is absolutely necessary to maintain the health of the cow and enable her to make the most efficient use of her grain ration. It is safe feeding to allow the cow two pounds of roughage for every pound of grain. If the cow will eat 20 pounds of good roughage with ten pounds of wholesome grain feed, there is no danger of impairing her digestion.

DO NOT NEGLECT MARES AT FOALING TIME

A year's effort may be lost by neglecting brood mares at foaling time. In view of the time which it takes to produce a foal one can ill afford not to give the necessary attention to the animals. A little care for a few nights will often save the entire year's work. E. A. Trowbridge, professor of animal husbandry in the Missouri college of agriculture, offers the following suggestions concerning the care of mares at foaling time:

In-foal mares may be worked to within two or three days of foaling. Should work cease before that time, rations should be decreased materially. Rations should consist of bran, oats and other laxative foods.

In-foal mares should be provided with box stalls, if possible, sometime before they foal. These stalls should be kept clean and properly disinfected.

As soon after birth as possible the foal's navel should be tied and disinfected with iodine or some other good disinfectant. Careful attention should be given to see that foals' digestive apparatus and kidneys are in working order within 24 hours after birth.

Mares, after foaling, should be given water, not too cold and not in too large quantity. The ration for two or three days should be comparatively light, and similar in nature to that fed before foaling. After normal conditions seem to have been established, the ration may be increased.

DON'T SELL BREEDING ANIMALS

"Don't sell your breeding animals unless you can replace them immediately with better ones," is the message the United States department of agriculture is sending to farmers and stockmen everywhere. "Don't let the temptation of high prices now being offered for live stock or undue fear of the prices asked for many popular feeds mislead you into selling a cow or sow that will drop the golden calf or litters. Such near-sighted profit-taking or lack of courage, if widespread, would strike at the foundation of the country's live stock industry and cripple it for years to come. As there is a shortage of meat animals throughout the world we can not hope to import new breeding stock to replace those we foolishly have killed off. Our own breeding animals, therefore, must be regarded as the seed essential to the domestic meat supply of the nation.

"Feeds not available or needed for human consumption should be used as largely as possible in feeding live stock. In this way a large proportion of the straw and stover ordinarily burned or wasted can be manufactured into meat and milk. Grain sorghums, wherever they are available, should be fed to release corn for human uses. Grain, where fed, should be used as economically as possible.

In constructing new buildings the farmer should consider at least five factors: Permanence, sanitation, fire resistance, first cost of construction and maintenance. Probably cement will come nearer to meeting all of these requirements than any material now used for building purposes.

Community breeding and community selection ought to be backed up strongly by the organization of a cow testing association, in order to make complete the success of farm dairying.

A New California State Record

The accompanying picture is of K. P. Tola Joe, a daughter of the King of Pontiacs from Tola Joe Gelsche, a 23.98 senior three-year-old daughter of the wonderful sire, Joe Gelsche De Kol Burke, whose dam was the famed old producer, Prilly, conceded by all breeders as one of the greatest producing and transmitting cows the world has ever known.

K. P. Tola Joe is owned by Karl A. Gotshall and A. R. Magruder and on May 23 she completed a seven-day official record of 21.719 pounds of fat from 459.1 pounds of milk at an average test of 4.73. Computing the above on an 80 per cent basis would be equivalent to 27.14 pounds of butter, which is now the senior two-year-old state record and, according to information obtainable, makes this California heifer the second highest two-year-old daughter of the famous King of Pontiacs, also the 208th A.R.O. daughter.

K. P. Tola Joe

The picture of K. P. Tola Joe does not do her justice as the same was taken by an amateur and without any previous preparation. The care of the heifer was in charge of D. W. Keel, superintendent for Gotshall & Magruder.

Mr. Magruder purchased K. P. Tola Joe at the Rhoades-McAlister sale last September from McAlister & Son. The heifer was bred by Stevens Brothers of New York state.

K. P. Tola Joe freshened at the age of two years, 11 months and 28 days, dropping a heifer calf sired by King Korndyke Sadie Vale 27th. From the date of her purchase until the middle of February she ran with the other heifers, receiving no special care. However, at this time Mr. Keel placed her in a fitting pen which was accessible to a large, roomy box stall where she received her fitting ration which was fed to her five times a day. This feed consisted of wheat bran, beet pulp, oats, barley, and linseed meal and was fed to her during the time the two and three time strings were milked. This ration amounted to approximately 12 pounds daily. It was Mr. Keel's belief that in feeding her often her appetite was stimulated. She always had alfalfa hay in front of her. She freshened in ideal condition, having a soft, pliable udder which on the fourth day developed to a very serious caked condition, causing her to go completely off her ration. To reduce this condition of fever hot applications were applied for 12 hours, during which time practically no milk could be obtained.

On the seventh day she was fed a ration consisting of three pounds of linseed oil meal, three pounds equal parts of oats and barley, five pounds of bran, 15 pounds of beet pulp. The ration was continued during the entire test. Mr. Keel attempted at various times the feeding of beets, cotton seed meal, molasses and middlings, but found none of these palatable to her. In fact he found it difficult to coax her to consume the extremely light ration she did.

A Year of Guernseys

A review of the activities of the American Guernsey Catte Club is being sent out by the secretary. From it we take the following facts:

The bulls admitted to the Herd Register now number 43,625, and the cows 72,614, a total of 116,239.

There was a gain of 47 per cent in the number of bulls registered this year over those entered last year and a gain of 37 per cent in the number of cows registered.

The transfers show an increase of 37 per cent over last year.

Twenty-eight bulls and 777 cows, a total of 805 head of Guernseys, have been imported during the year. From Guernsey, 24 bulls, 551 cows; from England, 3 bulls, 177 cows; and from Alderney, 1 bull and 47 cows.

Less than four per cent of the members of the association are on the Pacific Coast. Nearly 40 per cent of members reside in the Middle Atlantic section.

Three hundred breeders located in 27 states are now testing 1390 cows. This is an increase of 30 breeders and 217 cows during the year. The largest number of applications ever received in one week came to the office during the week of April 9.

High Producing Guernseys

On April 1, 1916, the average production of the ten highest cows in the aged class (five years or over) of the American Guernsey Cattle Club was 18193.4 pounds of milk and 948.98 pounds of butter fat. On April 1 of this year the average production of the ten highest cows in the same class is 19056.8 pounds of milk and 976.15 pounds of fat, showing an increase of 863.4 pounds of milk and 27.17 pounds of fat. During the year there has been an increase of 300 records in Class A with an increase in fat of 6.27 pounds.

The last cow to enter the class with over 900 pounds of butter fat is Imp. Dora II. of les Marais 37737. Her recently completed record is 16664.5 pounds of milk and 904.71 pounds of butter fat with an average test of 5.43 per cent. By this production she secures tenth place.

THE DE LAVAL LINE

Superior Dairy Equipment

THE IDEAL GREEN FEED SILO

Every dollar you put into an IDEAL now will bring you big returns next Winter

Feeding your cows on silage is just like turning them out to pasture.

Put up an Ideal Silo and watch your profits grow. An Ideal will pay its entire cost the first year and last from twenty to thirty years.

THE ACME FEED CUTTER AND SILO FILLER

With Alfalfa Meal Attachment and Molasses Mixer

If molasses is mixed with cut feed more of it is eaten and better results obtained both in beef and milk production.

ALPHA GASOLINE and DISTILLATE ENGINES

Hopper Cooled or Closed Jacket.
Stationary, Portable — Semi-Portable.
Sizes 1½ to 28 H. P.

Equipped with a high-class built-in magneto—Batteries, Coils and ignition troubles eliminated.

Alpha Engines start on the Magneto without Cranking.

Easiest starting engine in the market.
Long Life—Reliable Service.

Catalogs and full particulars gladly furnished to anyone interested in First Class Dairy Equipment.

Registered Shires — Blackhawk Stock Ranch. Importers and Breeders. Easton & Ward, Burlingame, Cal.

MACHINERY

WHY BUY NEW? SAVE HALF
Material guaranteed. It's 2nd hand after used few times, but not necessarily worn out.

WINDMILLS
Let the wind do it. 8-ft., $25; 10-ft., $32.50 to $35; 12-ft., $45 to $55. Have three 16-ft. mills, $125 and $95, cost new $285. Pumps as much as 4 h.p. engine for nothing once installed, beats gas at 19c.

TANKS—TANKS
1000-gal., $32.50; 2000-gal., $44.00. Used tanks guaranteed; 200-gal. redwood, like new, $7.50, with covers, $9.50; fine galv. 500-gal. with cover, $22.50; 1500-gal. galv. with cover, $22.50; 10,000-gal. galv., $125; 16,000, $175; swell heavy 20,000-gal. corrugated galv. tank with conical cover, $235; 10,000-gal. redwood, $75; new and used redwood and galvanized tanks, all sizes. See who's cheapest.

ENGINES. PUMPS. PIPE.
Most all sizes—in good shape.
Centrifugal pumps, 2-in. $24; 3-in., 4-in., 5-in., double runner; all size plunger pumps, $5 up; new pump jacks, $12.50; double-acting No. 3 Ames, $200, cost $660; Means double-acting deep well pump, $275; pumps 50 inches; 12-h. Lambert engine; 9-h. Foos, $135; 6-h. Stearns, $89. Many other first class engines very cheap.
Brass Cylinders, All Sizes.
Plunger rods, pipe, pipe fittings.
FINE BULL TRACTOR
Dandy for small rancher, pulls 2 4-gang mouldboard plows $295. Cheaper than horses and do 3 times the work.
Ranch Machinery. Sundries.
Walking, riding plows, $15 to $22.50; fine 2-gang mouldboard plow, $45; 3 or 4-gang disc tractor plow; alfalfa renovator, $25; 24-disc, 4-horse harrow, $38; mowers; buck rake, $20; 4-h.p. boiler, $48; feed cutter, $8.50; I.H.C. auto truck, $125; Bulldozer pump jack, $42; bone grinders, $6.50 to $12.50; feed mill $16.50, bath tub, $5; water trough, $4; new hay rake teeth, $2.75 for complete sets; tons pipe fittings, cement mixer, $25; sprayer $19.50; new discs, $1 each; SUNDRIES too numerous to advertise.
Wanted to buy first class material. No junk wanted. Pioneers in our line. DEMMITT CO., Upstairs, 120 N. Main. Yards, 816 Yale, Los Angeles.

Several new and slightly used engines at a bargain. Best makes. 1 to 35 h.p. Arnott & Company, Wholesale Machinery and Implements, 112 South Los Angeles St., Los Angeles, Cal.

For Sale—10 h.p. Fairbanks Morse engine and No. 4 Byron Jackson pump. In A1 condition; price very reasonable. L. Bayha, McFarland, Cal.

For Sale—38 H.P. "Otto" gas engine in good shape, at a bargain. E. A. Hayes, El Monte, Cal. Phone 48 R.

MISCELLANEOUS

Free for Six Months—My special offer to introduce my magazine, "Investing for Profit". It is worth $10 a copy to anyone who has not acquired sufficient money to provide necessities and comforts for self and loved ones. It shows how to become richer quickly and honestly. Investing for Profit is the only progressive financial journal and has the largest circulation in America. It shows how $100 grows to $2200. Write now and I'll send it six months free. H. L. Barber, 430-28 W. Jackson Boulevard, Chicago.

Young Man or young lady desiring to attend college can secure tuition and part or all of living expenses through easy, agreeable work during spare time at home, for established California company. State which college you prefer to attend. Address J. H. Yetter, 115½ N. Broadway, Los Angeles.

While the War Lasts—To help farmers grow larger crops at lower cost I reduce my charge for soil analysis from $11.50 to $7.00. Get particulars from R. R. Snowden, Agricultural Chemist, 320 Stimson Bldg., Los Angeles, Cal.

To Reduce the high cost of living, send for our Wholesale to Consumer Catalogue. Smith's Cash Store, 112 Clay St. San Francisco.

For Sale—Bostrom farm level, same as new. Address W. Fletcher, Orange, Cal.

BEE SUPPLIES

For Sale—175 to 250 colonies Italian bees with extra equipment; in eight-frame hives; can remain in present location if desired. Geo. A. Sill, Watsonville, Cal.

LUMBER

AAA—Lumber, New and Second-Hand; rough, $10 M; finished, $15 *A*R. W. shingles, 45c bundle. Dan P. Dolan, 1639 Mission St., San Francisco, Cal.

SAFE GRADE CROSSINGS

Repeated investigations of accidents at places where highways cross railways at grade show that a large part of these accidents is due to the failure of drivers to slow down as they approach the crossings. For this reason some public officials believe that the roads should be so constructed at the most dangerous crossings that drivers must reduce speed to a low rate. The California railroad commission has recently sent to a number of cities and countfes six plans for accomplishing this, with a request that they be tried or at least criticised. In each case there is a conspicuous signal or sign in the middle of the road near or at the crossing, and the driver must swerve to one side to reach the track. In some of the plans the driver must make an abrupt right-hand turn and another left-hand turn before the track is reached, so that slowing down is compulsory and not voluntary.

THE WASTEFULNESS OF SWARMING

THE old time beekeeper boasted of the number of swarms which issued from his hives, but the modern beekeeper knows that swarming is one of his worst obstacles to producing a large crop. The modern beekeeper knows from experience that after he has given all his energy to getting every colony as strong as possible at the beginning of the honey flow he must not permit the bees then to spoil it all by dividing their forces.

Of course it is impossible to do anything toward controlling swarming when the bees are in a box or "gum", and this is the chief reason why bees in a movable frame hive are more profitable. It is also unfortunately true that in spite of the beekeeper's most strenuous efforts colonies will sometimes swarm. In that event the beekeeper makes the most of a bad situation by keeping the forces together in another way.

If swarming occurs when honey is coming in the hive should be at once removed to a new place and a new hive placed in the old location, the bee specialists of the United States department of agriculture advise. The swarm is now hived in this new hive and because it is in the old location all returning field bees from the colony join the swarm and the population is kept up. Later on there are various ways of reducing the parent colony still more, for by this means the issuing of worthless after swarms is prevented.

The beekeeper who desires to get the greatest possible crop does not permit even one swarm to issue if he can help it. When swarming time arrives he examines every colony once a week. If he finds queen cells with eggs or small larvae in them he cuts every one out and thus makes it necessary for the bees to build other cells if they still persist in their efforts to swarm. If, however, he finds larger cells with old larvae he knows that the impulse to swarm has developed too far, so he must satisfy it in some way. He may make an artificial swarm—at his convenience and not at that of the bees—or if he is a producer of comb honey he may cut out all the queen cells and cage the queen for ten days until they get over their "swarming fever."

The skill of the beekeeper can usually be measured by the results of his work in curbing swarming. The poetry which others see in issuing swarms is entirely lost on a good beekeeper.

FARMERS' MUTUAL FIRE INSURANCE COMPANY

The organization and management of farmers' mutual fire insurance companies is discussed in detail in a new publication of the United States department of agriculture, Bulletin No. 530. These companies, it is said, represent one of the most successful forms of rural cooperation in the United States. Nearly 2000 of them are in existence and the total amount of insurance they have outstanding exceeds $5,250,000,000. In some states of the Middle West fully three quarters of all the insurable farm property is insured in companies managed by the farmers themselves, and organizations of this character exist in every state except Florida, Mississippi, Louisiana, New Mexico, Arizona and Nevada. The increasing number and size of these companies make it important that they should be founded on sound principles. The bulletin already mentioned takes up the problems that are likely to arise and discusses them fully. In addition suggestive articles of incorporation and by-laws are contained in the appendix, together with forms of application and policy blanks.

Book Review

THE MODERN GAS TRACTOR

"The Modern Gas Tractor, Its Construction, Operation, Application and Repair," by Victor W. Page, M.S.A.E., published by the Norman W. Henley Publishing Co., at two dollars.

This is a new edition of a book which became most popular with tractor owners. It is a book of 500 pages and on almost every one of them there is an illustration. There are also detailed drawings showing almost every feature of the gas tractor. There are 12 chapters touching upon the scope, advantages and application of power traction, design and construction, making and exploding gas, cooling and lubricating, functions and construction of clutch, gearset and differential, the tractor frame, driving and housing, troubles and their elimination, and designs for 1917 tractors. The book ends with miscellaneous rules and formulae.

We note in the preface: "The internal combustion motor has been responsible for many developments in the industrial sciences, but its greatest achievement has been the promotion of economical and efficient transportation. The improvements in the design of the modern gas tractor, which have made it an entirely practical and satisfactory source of power, have also opened up fields where it can be used to advantage and profit that would have been impossible with steam traction engines formerly the vogue, or other forms of power. * * * This treatise is intended to bridge the gap existing between the purely technical work and the manufacturers' instruction book dealing with one specific construction. If it has accomplished this the writer will feel amply repaid for the time and labor expended on its compilation."

LUBRICATION OF TRACTOR

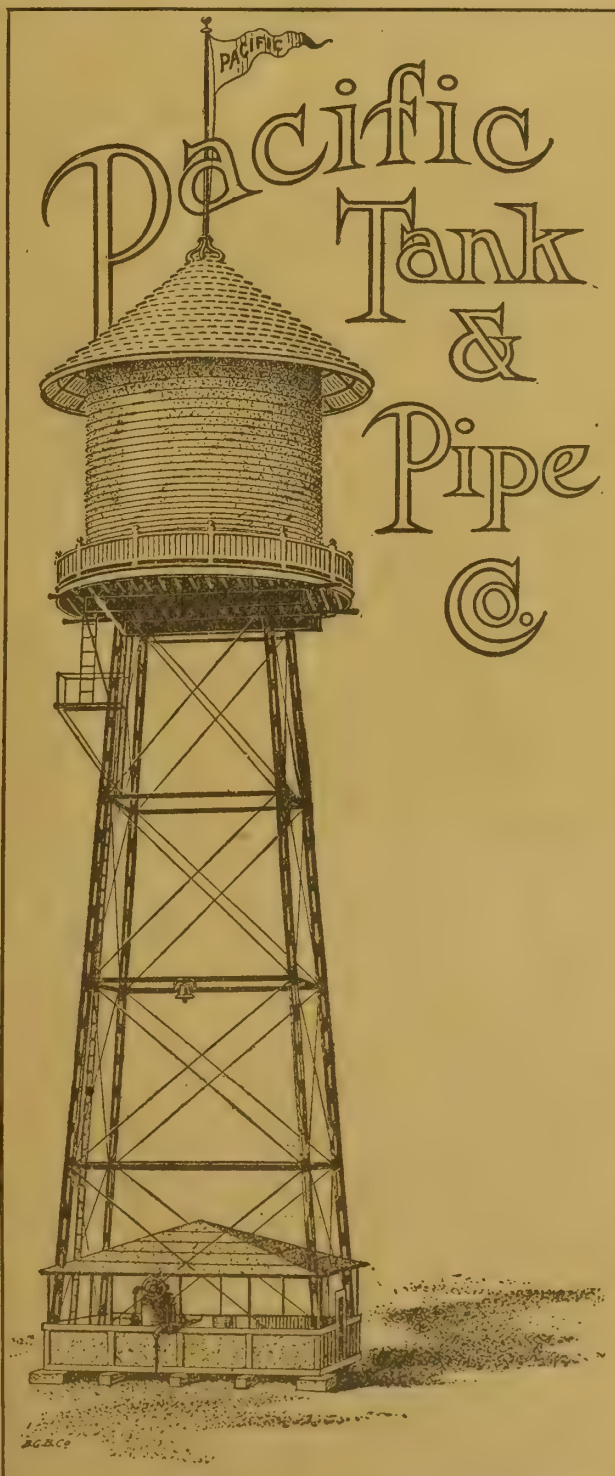
The one thing which stands in the way of the wear of the working parts of any machine is lubrication. Failure to provide adequate lubrication for all parts of the tractor has been the cause of more trouble and expense than any other cause. The failure to fill one grease cup, as has recently come under the observation of the writer, resulted in a large repair bill of $125.

The tractor motor should have an adequate supply of clean oil at all times. Although cheap cylinder oil is to be avoided, it would seem that clean oil is more important than expensive oil. One of the best tractor records known to the writer was made by an owner who, regularly at the beginning of each week, filled his engine with fresh oil after drawing off the dirty oil and washing out the crank case with distillate. So marvelous was the result that the engine ran for four years with little adjustment to the bearings. All this was accomplished with a medium-priced oil.—Prof. J. B. Davidson.

FOX TAIL

There are fields where foxtail has practically taken the alfalfa. There is not much that can be done with these but to plow them up and reseed. I have seen pastures so badly infested with foxtail that it was necessary to take the beards out of pigs' eyes every day. And even then some are almost sure to be overlooked and the sight of an eye lost. A pair of veterinary artery forceps is a good thing to use for taking foxtail beards out of an animal's eye.

In the interest of increased production of feed every bad foxtail field where irrigation is available should be plowed up and corn or sorghum planted during May or June.



Water is King

Next to air, it is the most necessary thing in the world. You want water where you want it, when you want it. It is too valuable to waste. You want pipes to carry it, and a tank to hold it without leakage.

Pacific Tanks and Pipes are constructed of Pacific Redwood, the everlasting wood—the only wood not affected by heat or cold, dry or damp atmosphere.

Pacific Tanks and Pipes cost a third as much as steel, and last four times as long. Why pay $165 for a steel tank to hold 5,000 gallons, when you can get a Pacific Redwood Tank of the same size for $58? The wood tank is not half as heavy and that makes a big saving in freight.

You save on the first cost, the freight—and what is most important of all, there's the long life of the Redwood, several times that of any other material.

Pacific engineers have planned and constructed tanks and pipes for 30 years. Their service is at your command.

Write us about your wants, the size of your place, the source of water supply, and any other information that will enable us to give you, in return, an intelligent plan, with prices, etc.

THE STAR SPANGLED BANNER

Oh, say, can you see by the dawn's early light,
What so proudly we hail'd at the twilight's last gleaming,
Whose broad stripes and bright stars through the perilous fight,
O'er the ramparts we watched were so gallantly streaming?
And the rocket's red glare, the bombs bursting in air,
Gave proof through the night that our flag was still there!
Oh! say, does that star-spangled banner yet wave
O'er the land of the free and the home of the brave?

On the shore dimly seen through the mist of the deep,
Where the foe's haughty host in dread silence reposes,
What is that which the breeze o'er the towering steep,
As it fitfully blows, half conceals, half half discloses?
Now it catches the gleam of the morning's first beam,
In full glory reflected now shines on the stream.
'Tis the star-spangled banner. Oh! long may it wave
O'er the land of the free and the home of the brave.

And where is that band who so vauntingly swore,
'Mid the havoc of war and the battle's confusion,
A home and a country they'd leave us no more?
Their blood has washed out their foul footsteps' pollution;
No refuge could save the hireling and slave
From the terror of flight, or the gloom of the grave,
And the star-spangled banner in triumph shall wave
O'er the and of the free and the home of the brave.

Oh! thus be it ever, when freemen shall stand,
Between their loved home and the war's desolation;
Blest with victory and peace, may the Heaven-rescued land
Praise the power that made and preserved us a nation.
Then conquer we must, when our cause it is just,
And this be our motto, "In God is our trust."
And the star-spangled banner in triumph shall wave
O'er the land of the free and the home of the brave.—Francis Scott Key.

OUR FLAG

THE subject of a flag or standard was considered early in the Continental Congress; and, on the 14th of June, 1777, this resolution was passed:

Resolved, That the flag of the thirteen United States be thirteen stripes, alternate red and white, that the Union be thirteen stars, white, in a blue field, representing a new constellation.

The admission into the Union, after the establishment of the present government, of Vermont and Kentucky as new states, caused the number of stars and stripes to be increased to 15 each; and the subsequent addition of five other states led to the following enactment, which is yet in force, approved on the 14th of April, 1818:

An act to establish the flag of the United States.

Be it enacted by the senate and house of representatives of the United States of America in congress assembled, that from and after the fourth day of July next, the flag of the United States be thirteen horizontal stripes; alternate red and white; that the Union be 20 stars, white in a blue field.

Sec. 2. And be it further enacted, That on the admission of every new state into the Union, one star be added to the union of the flag; and that such addition shall take effect on the fourth day July then next succeeding such admission.

Whenever, therefore, an American sees this glorious ensign of his country, the stripes recall to his mind the birth of the republic, with the events that surrounded it; the stars suggest its wonderful development in size, in resources, and in power; and, in homage to the national grandeur and protective authority which it represents, wherever he beholds it—whether in mid-ocean floating at the head of a passing ship, or waving aloft in the streets of foreign lands,—he lifts his hat to it with a patriotic feeling of filial love and pride.—Edmund Alton in St. Nicholas.

HOW TO DISPLAY OUR FLAG

IN order to show patriotism fittingly and to indicate the unanimous support of the president in his course in this great war, the American flag is being displayed liberally throughout our city. Our flag, however, is more than a piece of bunting. It is an emblem of our government and its principles, and as such an emblem our flag should be treated with due respect. As sometimes through thoughtlessness or carelessness our flag is handled without the respect which should be shown to it, the following rules found in the Army and Navy Journal of April 14, 1917, are published for the information of all who display the flag.

1. Our flag should never be used as a cover for a table or a desk, or otherwise placed where any object can be put upon it.

2. It should not be used to decorate a platform so that the speakers or those occupying the platform would be above the flag. If used about a platform it should be hung above the platform so that it would be above those occupying the platform. The flag must be above the man.

3. Our flag should never be draped or festooned, however attractively the colors may lend themselves to such effect. If draping or festoon effects are desired they should be made with red, white and blue bunting. When using bunting the red should be on top, the white should follow, and the blue should be below.

4. Of course everyone knows that in flying our flag the union should be up. If our flag is not flown from a mast or staff it should be so hung that the union is to the north or east as the case may be; the union should not be to the west or south.

If the foregoing rules be observed our flag will be treated with the dignity and reverence to which it is entitled as the emblem of all those principles of liberty and justice upon which our government is founded.

MY PET ECONOMY

Written for California Cultivator
By Mrs. S. B. Kohler, Oxnard

HERE is one of my pet economies. It is stove wood. Perhaps that seems strange, but I only use wood once or twice a week. I manage in this way, having a coal oil stove and a fireless cooker. I get breakfast on the oil stove and as soon as it is done turn out the fire and it stops consuming fuel, while the range would still be chucked full of wood and could not be turned out.

Then right after breakfast I heat radiators for the fireless cooker and put my midday meal to cooking in the fireless, which may be soup, meat and potatoes, say pot roast and potatoes cooked in the same kettle and a vegetable. As I have three kettles to my cooker I can cook the entire meal. Then a salad and a pie or some other dessert, and we have our meal. This takes about 45 minutes or can be done

The Cultivator Patterns

8398—Children's Dress. Cut in sizes 4, 6, 8 and 10 years. The dress is cut in one piece and has a separate guimpe.

8397—Ladies' Blouse. Cut in sizes 36 to 44 inches bust measure. Any of the pretty striped materials can be used for this blouse.

8393—Ladies' Vest. Cut in sizes 36, 40 and 44 inches bust measure. Figured and plain materials may be used in making this vest.

8381—Misses' Dress. Cut in sizes 16, 18 and 20 years. Long or short sleeves may be used and the skirt is cut in one piece.

8380—Ladies' Dress. Cut in sizes 36 to 44 inches bust measure. The dress has a three gored skirt.

8389—Children's Dress. Cut in sizes 6 to 12 years. The neck may be cut in either of two outlines and the skirt is in one piece.

8368—Ladies' Skirt. Cut in sizes 24 to 32 inches waist measure. The skirt is cut in two gores and has slightly raised waist line.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

California Cultivator

Los Angeles

while doing the kitchen work, then my meal is cooking and I have the rest of the forenoon to do something else besides carry in wood and stand over a hot kitchen range.

I bake bread once or twice a week, generally Wednesdays and Saturdays, and on those days do my cooking on the range. Have a boiler attached which heats bath water at the same time.

I live on a ranch and have a family of seven most of the time and all hearty eaters. So for my evening meal I always plan something that will cook quickly on my oil stove. When baking with the oil stove such things as pies, biscuit, cake or pudding I also manage to cook the rest of the meal in the same oven and at the same time.

Wood is perhaps a funny thing to be saving with, but the present prices make one want to do so. Wood is eight or nine dollars a cord and coal oil only ten cents a gallon when taken from the company's wagon, and $2.50 worth of oil will keep one supplied for two and a half or three months while a cord of wood will not do so much more, if as much. Now don't think for a minute that I am trying to drum up trade for Mr. John D., because I am not at all interested in his business (but in my wood pile).

My fireless is another great help to save even the oil and time too. When one puts meals to cook in the fireless there is no fear of them burning, but the satisfaction at meal time that they are done and ready to serve piping hot. And one has many hours to spend calling or doing some other work, and the kitchen is always clean which is another comfort.

I have another pet, and that is butter. I never use butter in making cakes or cookies. I find that cottolene is much better. The cake will not sink nearly so easy as with butter, but one must add a little salt. Cream or work in the sugar same as butter.

Well, I think I will say good bye because I think two pets are enough for any one woman.

BEATING THE HIGH COST OF DRY GOODS

Written for California Cultivator
By Mrs. C. S. C, Saticoy

IT seems to me that my whole life is one round of economies, saving all left over eatables for stews or salads, making over clothes and passing them on to the "third and fourth generation," saving everywhere so it's hard to choose just one "pet economy." However, I think I'm proudest of my use of flour and sugar sacks.

I use just about enough flour to keep myself in 50 pound sacks for dish towels, this being to my notion the handiest size for the towels. Then I go to the baker's and buy the empty hundred pound sacks which vary in price from 40 to 60 cents a dozen. They also vary in quality, but are mostly quite heavy and are easily bleached. And Oh, the things you can do with them! Hem four of them and then faggot them together into a square, and you have as dainty a breakfast cloth as any Japanese affair at a cost of 20 cents or less.

The younger children have night gowns made of the same material and when trimmed with braid or feather stitching, are as nice as any one could wish for summer wear. Of course they are most too light for winter use.

The kiddies every day underwear descended from the flour sack, and I'm sure no other muslin of like quality could be bought for five cents a yard—(or less as the case may be), and I mustn't forget the pillow cases for the sleeping porch! All of flour sacks of course. Just rip your sacks and bleach them, cut right size, sew up and hem, and you have a slip that is much easier to wash than the firm pillow case muslin and only costs five cents a slip.

Sugar sacks, when hemstitched, make the nicest kind of sash curtains.

Then the five and ten pound meal sacks, when hemmed, make the nicest kind of napkins for the children's lunch baskets, and it causes no heartaches if one is lost or badly stained, as it does when such things happen to mother's good napkins.

One of my neighbors once dyed some of the sacks and made herself a nice house dress. That I haven't done yet, but I have dyed some of the light weight ones for comfort covers, and I know if I just keep thinking I will find many other uses for the lowly flour sack and incidentally reduce the dry goods bill.

MAKING SOAP—CLEANING HATS

Written for California Cultivator
By Miss A. Butcher, Healdsburg

IN this time of high cost of living a few suggestions along these lines will not come amiss. By carefully saving every bit of grease that might seem of no consequence a bar of soap for kitchen use may be made. Dissolve one teaspoon of lye (use paper bags or old gloves to protect the hands) and a quarter of a teaspoon of borax in four teaspoons of hot fat and set the mixture aside to cool. When cool enough to handle stir with a stick, always stirring in the same direction to make a smooth soap. Stir until the soap is about as thick as honey, then pour it into a wet tin mould. Do not remove too soon or it will crumble.

To Renew An Old Hat

A paste of lemon juice and sulphur rubbed on a leghorn hat will make it look almost like new. Rub the paste thoroughly over the hat and allow it to dry. Then brush the hat vigorously to remove the dry powder. The result will surprise you. Equal parts of magnesia, pulverized soap and French chalk will clean a chiffon or lace hat. Cover the hat well with the combined powders and let it stand for 24 hours; then lightly shake off the powder,—the old soiled hat will be as clean as new.

TO PROLONG THE SERVICE OF OLD SHOES

Written for California Cultivator
By Mrs. A. C. Butcher, Healdsburg

WHEN a crack or a hole appears in a leather shoe it may be patched in the following manner: Cut from a discarded leather shoe a piece of soft, pliable leather for a patch. With the scissors trim to a neatly round shape larger than the hole to be mended. Apply a heavy coat of warm glue that has been dried down to a very thick consistency, then place the patch over the hole and press firmly with the fingers. Allow it to dry in the sun or near the stove. The glue must be very thick or the leather will curl on the edges. If properly done patch will last a long time.

The inconvenience of using shoestrings that have lost the tined ends may be very satisfactorily overcome by dipping the end in hot glue and when almost dry pressing into the rounded shape desired.

The Ounce of Prevention for Turkeys

Written for California Cultivator By Jean A. Koethen

DOCTORING sick chickens is hard enough and hopeless enough, but doctoring turkeys is even harder and more hopeless. The sick turkey is the most forelorn, miserable creature to be found anywhere, and doctoring it is a waste of time and medicine. The one exception I have seen to this rule is swellhead. Turkeys are not as subject to colds as chickens are. When they do appear with swollen eyes and sticky nostrils, one may put it down as settled that there is either serious mismanagement or some roupy taint in the blood. In the one case, persistent use of the permanganate treatment will usually effect a cure, though the bird should, of course, never be allowed in the breeding pen; in the other, removal of the cause is sufficient.

Taking it by and large, the only cure for sickness in turkeys is prevention. This sounds more difficult than it really is, for the turkey is a creature of simple needs, and once it reaches roosting age requires little attention. The first few weeks are trying but need not be as trying as they generally are.

The first and most common of the ills young turkeys are heir to is blackhead, a disease we supposed till recently was not to be found on the coast. Now we know that blackhead, instead of being passed from bird to bird through the droppings, is a disease to which every turkey is liable. The infection is not outside but in its very constitution, and is developed by overfeeding. This seems to be the plain truth, as it has been worked out at the Rhode Island station and through the experience of many breeders. If you can keep your turkeys from ever eating too much they will probably never develop blackhead, but what is too much? The Rhode Island experts, to whom I referred last week, think that all a poult will eat in two or three minutes is not too much, but you notice they say, "two or three", and that is not very exact. I would sooner keep it down to two, myself, but it is quite possible one poult could bear three minutes of feeding where another would be killed by it. So it seems that the Rhode Island station, while it has given us something to think about, has not brought us so very far on the way to sure prevention of blackhead.

It must be remembered, and never for a minute forgotten or overlooked, that blackhead is more likely to appear toward the end of the second month than either earlier or later. As this period approaches it is a good plan to cut down the ration and force the poults to depend more on their own foraging. The hungrier they act when you come to feed them, the better pleased you may be, for a perfectly healthy poult is always hungry. But do not let this hunger beguile you into feeding them a little longer or a little oftener. They must be kept hungry. This is the secret, if secret there is, in preventing blackhead.

Even when the second month is past do not think you are out of the woods. Some poults can withstand the evil effects of overfeeding longer than others, and you may get them through two months only to see them collapse in the third. After the third they are comparatively safe.

Roup, swellhead and catarrhal colds of all sorts, from watery eyes up, nearly all come, as I said in the beginning, from mismanagement. The turkey is a fresh air bird. It must have fresh air night and day. If you shut poults and mother in a tight coop that contains only oxygen enough for the hen, the poults will suffer. And not only will they suffer for lack of air during the night, but they will be too warm, and, coming out into the chill morning air after 12 hours of overheating, will inevitably take cold.

But there is another enemy to the poult's health almost as great as foul air, and this is dampness. Keep them out of the rain and off wet ground. Rheumatism is quite a common disease among little turkeys and comes invariably, I believe, from exposure to dampness. The coop they sleep in should have a board floor. Their run should be so arranged that it can be covered if one of our rare May rains comes on. The ground they run on should be dry. A little dew does no harm if the mother is kept in the dry run where they can always go to her for warmth.

Of lice, to which the death of young turkeys is so often attributed, I have little to say, for I have never lost a poult from this cause nor seen a louse on one. That they do become so infested and die when the hen is lousy, I do not doubt, but when the hen is kept clean during incubation and dusted occasionally while she mothers the poults, and they are dusted now and then, there is no danger of lice. It is well of course to keep lice in mind, along with the other enemies of young turkeys, and to see that they are properly guarded against, but they are not the serious menace that overfeeding is. And the same thing may be said of mites. I presume mites would kill a poult even more quickly than a chick, but there is no excuse whatever for allowing them to get into the coop. A clean coop to begin with and occasional painting with kerosene and carbolic acid (one part crude carbolic to four or five of kerosene) is absolute prevention.

A condition, rather than a disease, to which half grown turkeys are liable, if they have not been carefully fed, is known as pendulous crop. The crop begins to stretch, and stretches till it sometimes touches the ground. This condition is supposed to come from overfeeding or irregular feeding. The membranes are easily stretched, and if stretched a little by one over-hearty meal, will stretch a little more when the poult is given another opportunity for stuffing. In time the membranes are so stretched that they can not regain their normal size without assistance. Then the crop must be bandaged or a piece of it cut out, an operation that is by no means easy. Careful feeding is a sure preventive for this annoying trouble. Turkeys that are never allowed to stuff their crops when they are little may stuff them later, to be sure, but the membranes are less elastic and no harm is done.

Whatever we may think of the danger of blackhead from running on filthy ground, it is only right that every brood of young turkeys be started on clean ground and with as much room to range and as much green feed to nibble at as possible. Don't let them run in dirty chicken runs. It may not hurt them, but they are vastly less liable to disease if they are on good, clean green range. Our turkey crop in California ought to be immensely profitable, with all the virgin land we have for range, and it will be when farmers realize how little beside good clean range turkeys require.

Red Comb Chick Mash With Buttermilk

The greatest Chick Grower ever produced. Prevents White Diarrhoea—Authority for this statement found in Bulletin No. 162, University of California, Berkeley, California. Write to Berkeley for this bulletin. Hale & Edwards Co., Chicago, who manufacture the RED COMB and RED HORN FEEDS are the only people who have succeeded in drying buttermilk—without killing the Lactic Acid Bacilli or materially reducing digestibility. Tests made after this Dry Buttermilk has been manufactured SIX MONTHS show 10,000 Live Active Lactic Acid Bacilli to the centimeter. Send for a small sample of this Dry Buttermilk and convince yourself of its merit.

Three-Day Poultry School at Van Nuys

The Van Nuys Poultry Association calls attention to the three-day poultry school to be held by the University of California at Van Nuys, commencing Tuesday, June 12, 1917, under the auspices of the Van Nuys Poultry Association and Chamber of Commerce.

This school is designed to serve all poultrymen and persons interested in poultry craft, living in Southern California, and who are not convenient to the school at Davis. The instruction will be in charge of Prof. J. E. Dougherty of the Davis school and is absolutely free to all who desire to attend. All expenses of the school are borne by the state.

There will be lectures each forenoon and afternoon, and it has been arranged to provide practical instruction in the poultry yards by trips through the ranches in the Van Nuys colony each afternoon following the lecture. The lectures will be held in the High School auditorium, which will seat 900 people.

Program

Tuesday, June 12.—10-12—Housing and Yarding Poultry; 1:30-3:30—Feeding for Profitable Production.

Wednesday, June 13.—10-12—Vital Factors in Incubating Chicks; 1:30-3:30—The Fundamentals of Successful Brooding.

Thursday, June 14.—10-12 Principles of Poultry Breeding; 1:30-3:30—Selecting and Culling the Layers.

All who desire to take the course will register on Tuesday morning from 9 to 10. Bring pencil and note book and come prepared to take notes and ask questions, as time will be given for a discussion of each lecture. In addition to the regular students, visitors will be welcome to attend.

The High School Domestic Science Class will serve lunch each day at 25 cents a plate. Any of the poultry students who so desire, can obtain their noon luncheon there.

A great many from surrounding communities expect to come by auto each morning and return home after the afternoon lecture. Ample room will be provided for parking the machines during the day.

A field trip through the poultry colony will be made every afternoon after the lecture.

PEACH PRICES

A circular of Peach Association says:
According to inventory, we have unsold a limited quantity of both yellow and Muir peaches. We, therefore, offer our remaining stocks, each car to contain the following approximate percentages of grades, and at prices set opposite:
40 pct. Standard Muirs at 7½c
5 pct. Fancy Muirs at ..... 9 c
10 pct. Extra Fancy Muirs at..... 9½c
10 pct. Standard Yellows at 7½c
5 pct. Choice Yellows at 8¼c
10 pct. Fancy Yellows at..... 8½c
20 pct. Extra Fancy Yellows at..... 9 c
All quotations bulk basis.
For 50-lb. bxs. unfaced, add.... ¾ per. lb.
For 50-lb. bxs. faced, add..... ⅞c per lb.
For 25-lb. bxs. unfaced, add .. ⅞c per lb.
For 25-lb. bxs. faced, add ....1 c per lb.
For 10-lb. bxs. unfaced, add ..1⅛c per lb.
For 10-lb. bxs. faced, add ....1⅛c per lb.
We also have approximately three cars of slab peaches, which we offer at 7¼c, bulk basis.
We will continue to receive orders until further notice for fancy peeled peaches, either for assorted or straight car lots, at 12c, bulk basis.
All of the above we quote f.o.b. factories, California, where stocks are available, subject to our confirmation and subject to goods being unsold, for May-June shipment; prices guaranteed against our decline to June 30th, 1917.

TOLD HIM TRULY

"Johnnie, how do you spell nickel?" the proud father asked.

"N-i-k-l-e," responded Johnnie.

"That is not the way the dictionary spells it," said the father.

"You didn't ask me that. You asked me how I spelled it."—Exchange.

Citrus Fruit Market

LOS ANGELES, June 6, 1917.

Navels are still selling in the auction but as far as shipments are concerned are practically cleaned up. This has lessened the number of cars forwarded and market has materially strengthened. Four dollar prices have been received for many shipments. Shipments are now falling below the 150 market and the Valencias which will have the market from now until late November have practical assurance of good market.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 27,153 cars, lemons 4824, total 31,977; to same date last season, oranges [illegible], lemons [illegible], total [illegible]. From Central California to date this season oranges 4094, lemons 164, total 42[illegible] to same date last season, oranges [illegible], lemons 146, total 5494. From Northern California to date this season, oranges 845; to same date last season, oranges 601, lemons 1.

FROM THE AUCTION

May 31

New York: 46 oranges, 4 lemons, market stronger. Nav., $2.45@3.75; sales generally running about $3.00.

Boston: 25 cars, higher. Nav., $2.45@3.50; grapefruit, halves, $2.65@2.90.

St. Louis: 10 cars. Nav., $1.60@3.25; lemons, $2.30@3.35.

June 1

New York: 23 oranges, 1 lemon. Nav., $2.70@3.65; bloods, $2.70@3.05.

St. Louis: 13 cars. Nav., $2.15@3.00; seed., $2.30@2.85; lemons, $1.70@2.90.

June 4

New York: 43 oranges, 2 lemons. Higher. Oranges, $2.75@4.05; grapefruit, $1.70@2.00.

Boston: 26 cars. Nav., $2.30@3.60.

June 5

New York: 33 oranges, 1 lemons, slightly lower averages. Nav., $2.10@3.85; Mikes, $2.95@3.75; Val., $3.20@3.65.

Philadelphia: 10 cars. Nav., $2.15@3.40; Val., $3.25@3.60; lemons, $3.30@4.00.

Boston: 14 cars. Nav., $1.80@3.65; lemons, $3.05@3.75.

HELPED BY THE SERMON

A colored preacher was vehemently denouncing the sins of his congregation. "Bredern an' sistern, Ah warns yo' 'gainst de heinous sin ob shootin' craps! Ah charges yo' 'gainst de black rascality ob liftin' pullets. But above else, bredern an' sistern, Ah demolishes yo' 'gainst de crime ob melon stealin'."

A brother in a back seat made an odd sound with his lips, rose and snapped his fingers. Then he sat down again with an abashed look.

"Whuffo, mah fren'" said the parson sternly, "does yo rar up an' snap yo' fingers when Ah speaks ob melon stealin'."

"Yo' jes remin's me, pahson," the man in the back seat answered meekly, "wha' Ah lef' mah knife."

SPEED OF CREAM SEPARATORS

Thousands of tests made with different cream separators during the past two or three years by government experiment stations and other dairy authorities have proved conclusively that many thousands of dollars worth of cream were being lost by farmers because they turned their cream separators too slowly.

It was shown that in many cases, with a herd of ten cows, this loss ran from $50 to $100 a year, and often more.

As a result of these investigations, and the investigations made by its own engineers, the De Laval Separator Company designed and perfected a Bell Speed-Indicator, and one of these indicators is now a part of the regular equipment of every hand-operated De Laval Cream Separator. Its operation is simple and is such that the bell rings as long as the machine is run below the proper speed and is silent whenever the proper speed is maintained.

Get this valuable free book

Do you own an orchard? Or are you going to plant one?

If so, you will find information worth many dollars to you in the Giant TREE BOOK, "Better Orchard Tillage." This book is written especially for Pacific Coast fruit growers. It tells how to have thriftier, faster-growing, earlier-bearing trees by planting in beds blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

It tells also how to secure better drainage and increased moisture-storage capacity in established orchards, and how to get larger yields and save money on fertilizers.

The book contains illustrations that show exactly how to do the work. There are chapters on preparing the beds for trees and increasing the plant food by deep tillage. Also there are directions for blasting in established orchards or groves, and interesting letters from many prominent fruit growers.

Mail the Coupon

Mark and mail the coupon—or a post card—and this valuable book will be sent *free*. Do it *now*—before you forget it. Other illustrated books on Stump Blasting, Boulder Blasting, Subsoil Blasting and Ditching, will also be sent on request.

Twenty Million Miles of Telephone Wire

The telephone wire in use in the Bell System is long enough to run from the earth to the moon and back again forty times.

The Bell System has about twice as much telephone wire as all Europe.

More than 500,000 new telephones are being added to the Bell System yearly—almost as many as the total number of telephones in England.

In twelve months the Bell System adds enough telephones to duplicate the entire telephone systems of France, Italy and Switzerland combined.

In proportion to population the extension of the Bell System in the United States is equal in two years to the total telephone progress of Europe since the telephone was invented—a period of about forty years.

The Bell System fills the telephone needs of the American people with a thoroughness and a spirit of public service which are without parallel the world over.

Some Hints on Onion Culture

Written for the California Cultivator by John N. Gardiner. Notes from Practical Experience

THE accompanying picture shows three onions placed side by side, measuring 13½ inches, weighing 2½ pounds in all, which were grown by the writer from seed sown the first of September last and harvested the latter part of May. They are the White Queen variety, and about ¾ ounce of seed was used at a cost of 20 cents. The space in my garden where these onions were grown measures 45 feet long by 6 feet wide, whereon about 150 pounds of the bulbs were harvested, running all the way from two to five inches in diameter. This season there were quite a few thick necks, due to the long continued cold, which materially retarded the growth, as they should have been cured a month or six weeks earlier.

The onion requires for proper development cool weather and ample moisture in the early stages, concluding with heat and dryness at the time of ripening, hence the best time for starting the seed is late in the summer and early in spring, as during our hot dry months it is difficult to prevent the bulbs from ripening prematurely. The plant is a heavy feeder, and it is practically impossible to have the ground too rich, and as a large yield can be had from a small space, it is advisable to manure heavily. However, fresh manure will produce large tops at the expense of the bulbs, but if it is thoroughly incorporated with the soil and wet down sometime in advance of planting, good results should be obtained. Poultry manure is considered the best fertilizer for this crop, especially as a top dressing, and can be applied two or three times during the growing season. Some growers use a solution of nitrate of soda, which I have found will force the onions to good sizes, but as it is a strong stimulant, the keeping qualities of the bulbs will be seriously impaired. If you have some wood ashes available, spread thin

Nearly a Half a Yard of Onions

Grown under right conditions, the onion makes a great crop. The center one weighs 24 ounces. Grown by John N. Gardiner.

Continued on Page 674

Is Not Your Home Place Worthy a Name?

For Sentimental and Financial Reasons and for Convenience a Name for the Farm is Desirable. The State Will Protect the Name and, More, the Name May be Made a Brand and Trade-Marked

SOME years ago the California Cultivator urged the naming of the farm and gave at that time several lists which were made up from names which were adopted. There are hundreds of such named homesteads now in the state. How these names may be protected has been a frequent question so we wrote the department of state of California, and from the Trade-Mark department have the following from its attorney:

H. M. Standerwick

Any farm, ranch or villa owner in California may have the name of his farm, ranch or villa registered by forwarding proper application together with a filing fee of $1 to the secretary of state. This registration is provided for in an act of the legislature approved March 2, 1911.

The state of California has also provided for the filing of claims to trade-marks in the office of the secretary of state, the essential requirements being a specification of the trade-mark, together with an affidavit of exclusive ownership. The filing fee for a claim to trade-mark is $5.

In some quarters confusion has arisen as between a farm name filing and a trade-mark filing. The former is limited to those cases where the name is used merely as a fanciful designation of a farm, ranch or villa. The latter is proper where the name chosen is used, not as a fanciful designation for a farm, ranch or villa, but as a trade-mark upon the products produced upon such farm, ranch or villa.

As a matter of fact the filing under the farm and villa act has little or no advantage viewed from a commercial standpoint. The act covering this filing is brief. It provides for the form of application, instructs the secretary to issue a certificate of registration, where no similar name has already been registered, and carries but one penalty, namely:

"Any person who shall register as his own any such name already in use in this state, knowing such name to be adopted as the name of a farm, ranch or villa therein, or shall make use of such name when regularly registered and in use by any other person entitled thereto under the provisions of this act, shall be guilty of a misdemeanor."

It will be noted that there are no specific provisions for civil remedies as in the case of a trade-mark. For in the case of trade-marks, one may prevent illegal use by injunction or recover in a civil suit for damages, and the criminal liability also remains.

Since the enactment of the farm and villa act there has been a very small registration of names, the total up to June 7th being an even 150. As against this trade-marks are registered at an average rate of 40 a month, and at present there is in excess of 10,000 claims, estimated on file in the office of the secretary of state.

It would seem, in view of some of the trade-mark provisions, that when one chooses a name for a farm, as for example, Sunnyside Farm, he should be protected in this name as a trade-mark under the farm and villa act filing. For example, section 3199 of the political code provides that any person who has first adopted and used a trade-mark or name, whether within or beyond the limits of this state, is its original owner. Various state and federal decisions point out that "the mere act of filing or registering does not confer title." Therefore if one should register his farm name "Sunnyside," and use this name as a trade-mark upon the products of his farm, and subsequently another should register the trade-mark "Sunnyside" for use with farm products, it would appear from the foregoing that the first user would be the original owner and therefore entitled to exclusive use of the trade-mark, and his original use would be evidenced by his prior filing of the farm name.

However, as against this the point is made, and this is the rule now governing filings in the office of the secretary of state, that the trade-mark laws do not contemplate that a farmer may register his trade-mark for $1 and all other classes of producers be required to pay a fee of $5 for a registration of their trade-marks. If so the act of 1911 would constitute class legislation and be held unconstitutional.

Also there is this to remember: The application for a registration under the farm and villa act is very brief, contains few details and is not supported by an affidavit. It reads:

"APPLICATION

To all to whom it may concern:

Be it known that ..... being the owner of a ..... located at ..... County of ....., State of California, hereby applies for registration as a name for said ..... the following words ....."

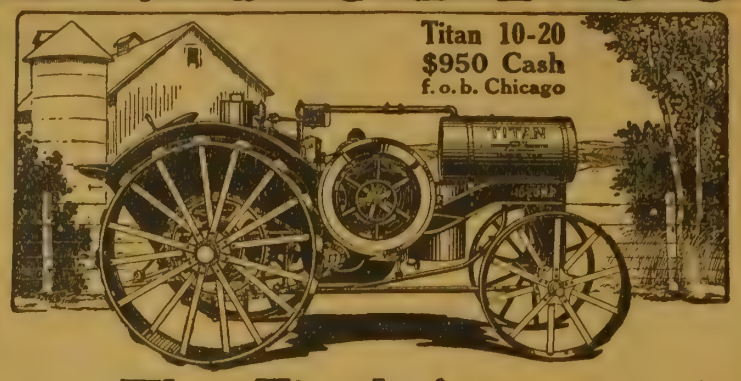
You will note that not even the signature of the applicant is required. Therefore such an application when relied upon as evidence of ownership of a trade-mark, would have little weight with the courts.

On the other hand the trade-mark laws are more strict. The applicant must set forth that he is the exclusive owner of the trade-mark and swear to this statement before a notary public. The words he chooses must constitute a trade-mark in law before he can obtain exclusive use to them, while any words not already chosen by another may be registered as a farm name. Under the trade-mark law no one may obtain exclusive use to descriptive words or phrases or geographical names. If this rule were in vogue under the farm and villa act, it would knock out nearly all of the present filings of farm names.

Personally I am of the opinion that a filing under the farm and villa act can have no great advantage unless regarded in the light of a luxury. One may choose the name, say Chispa Villa, for his country home, have mail addressed to Chispa Villa, and by registering the name prevent another from using the name Chispa Villa for the little shack across the creek, but here, with his pride satisfied, his privilege ends. For should he go into court to prevent another from selling Chispa spuds, when he himself has failed to comply with the trade-mark laws and relies only on his farm name registration, he will find the courts a cool receptor of his claims.

Our advice, based upon a study of the problems that have come up from time to time, to the man who seeks a filing under either or both of these acts, has been:

"File under the farm or villa act, if you wish to protect merely a fanciful designation for your farm, ranch or villa; file under the trade-mark laws if you wish to protect the name as a trade-mark for products produced upon the farm, ranch or villa, and file under both acts if you wish to make the double protection."



The Final Answer

To the Tractor Fuel Question

WE believe that a farmer who buys a kerosene tractor costing hundreds of dollars is entitled to get what he pays for.

We **know** that **Titan** tractors are real kerosene tractors. When you buy a **Titan** tractor you are safe. You have the **written guarantee of a responsible Company** that your tractor will do good serviceable work, **using common coal oil as fuel** at all loads. That is the final answer to the tractor fuel question.

Titan tractors are now built in three sizes, 10-20-H. P., the 3-plow outfit; 15-30-H. P., for 4 and 5 plows; and 30-60-H. P. for the heaviest work of the largest farms. All operate on kerosene.

The 10-20-H. P. size is a two-speed tractor, 1.85 and 2.50 miles per hour, with a smooth running twin-cylinder engine, slow speed, mechanically oiled, starting and running on magneto. It can be used for any field work you would expect nine or ten horses to do, and it will run any machine that takes up to 20-H. P. at the belt.

If you place your order soon you can have a **guaranteed Titan tractor** for the heavy spring work. Drop us a line so we can send you full information at once. Don't wait. Write now.

Processing Citron

By Special Contributor

THESE very complete directions for processing citron were given in the Cultivator of September 14, 1911. Upon request we repeat.

In preparing citron for preserving it is halved, put in brine for three weeks, and said brine must be strong enough to bear the weight of an egg the entire time the citron is in it. By keeping up the proper strength of the brine, the citron can be kept in storage until necessary to use it, being kept this way many months.

You can not depulp the citron raw, as the fiber between pulp and rind is too strong. The citron is boiled in water from 45 minutes to an hour, which boiling loosens up the pulp so it can be easily removed with a spoon. The boiling also brings out the salt in the fruit and after it is dipped in two washings of cold water, all salt should have been removed.

Now the citron is ready for taking up the syrups. Since the citron has already been boiled in only water for about one hour, its texture is softened up so that syrups can soak through it evenly. A syrup can be prepared thick as honey and the citron boiled in it (do not put into the syrup more than one-half its weight of citron—into 100 pounds of syrup put only 50 pounds of citron), the water in the citron will dilute the strength of the syrup. Hence the water of the citron must pass off as steam during the cooking and at the end of one hour the syrup should be just as dense as at the start. Now the citron can be removed with its syrup and both allowed to stand for nearly a week in some vessel.

At the end of the first week the cook will find that the strength of the syrup has greatly decreased. Now the syrup should be brought to its proper strength and the citron cooked in it a second time.

Each time the citron is removed from the vessel in which it is cooked to the vessel it is to stand in, the syrup should be of proper strength. This recooking should take place as often as the syrup is found below the standard in strength. When the syrup has become constant in density, the citron can be kept stored this way at the desire of the cook as long as the syrup covers the fruit, though it is exposed to the air. Dense syrups are preservatives, but weak ones invite fermentation.

Citron should cure up in the syrup for at least four weeks. After this time the syrup should be drained from it and the fruit allowed to dry upon trays in a dry place away from the sun and the bees. It will take from five to seven days for the fruit to dry.

When it is dried, it is dipped into a crystallizing syrup made from pure cane sugar. The syrup is prepared by dissolving sugar in boiling water until you get a super saturated solution—allow the syrup to stand for five hours when a crust of sugar will be formed upon the top—remove the crust and dip the fruit well. Next lay the fruit upon clean trays and after 24 hours standing, a nice crystallization of sugar will cover the fruit. At last the fruit is ready for boxing for shipment.

Note: Prepare your syrups used for cooking three-fifths glucose and two-fifths cane sugar. Cooked in clear glucose the flavor is lost and fruit is too tough. Cooked in straight sugar syrup after standing awhile the sugar crystallizes in it, and transparent condition is lost and fruit becomes brittle.

Orange and lemon peel can be candied according to the same process.

Avocado

PRESIDENT H. J. Webber and Secretary Charles D. Adams of the California Avocado Association have sent to the California Cultivator the following letter:

At the meeting of the California Avocado Association held in Los Angeles, May 18 and 19, the following resolution was unanimously adopted:

"Resolved that the California Avocado Association urge upon the various Los Angeles papers publishing market reports the importance of using the name 'avocado' instead of 'alligator pear' or 'avocado pear' and of classing the avocado under the appropriate name of fruits rather than vegetables. Resolved further that the secretary be instructed to send each paper publishing market reports a copy of the above resolution."

We beg to call attention to the fact that "avocado" is the name used and sanctioned by the United States department of agriculture, the state university of California, and the Avocado Growers' Associations of Florida and California. It is a name common in English literature since the sixteenth century and is the recognized English term.

On the other hand "alligator pear" or "avocado pear" and similar expressions have come to be used by some of the shippers in handling this fruit, but among the people as a whole are not so well recognized as the name "avocado". It is important in introducing this new fruit that it become known under a suitable and proper name. We shall thus be greatly obliged if you will kindly so far as possible assist the California association in getting the correct terminology of this important fruit generally recognized in California.

Dates in Fresno County

W. R. NUTTING of Fresno was a pioneer in raisin culture and later the prime mover in the organization of the association which has saved and made most profitable the raisin industry. Now he is pioneering in the matter of commercial date culture in the central part of the state. On a tract of some 40 acres about 18 miles east and south of Fresno Mr. Nutting is planting dates, and so far as can be determined from the young seedlings is securing some promise of future results. One requirement of the date is abundance of water, and to save every drop he has constructed a system of redwood flume which is not only a water-saver but a labor-saver. One who has seen Mr. Nutting's flume in-

stallation and examined its workings writes:

"Mr. Nutting is very enthusiastic over his discovery, which he has applied with thoroughly satisfactory results to a tract of agricultural land which he is developing near Fresno.

"Irrigation ditches, particularly in sandy soil, very often break as a result of gopher holes that begin with seepage and finally break completely through. This necessitates expensive delays on the ranch while repairs are being made. Mr. Nutting has devised a system of flumes made of 1 x 12-inch redwood boards. He now has half a mile of these flumes and is planning to build another half mile. He finds this gives perfect control over irrigation. The distribution of water is entirely by gravity, using a pump to raise it at the source of supply. In addition to a uniform and dependable supply of water, this system of redwood troughs can be taken up and relaid, thus changing the direction of flow with small expense. Mr. Nutting's experiment with this type of irrigation is being watched with great interest by the ranchers and the same system will be installed on quite a number of other ranches."

Redwood Makes a Fine Flume
W. R. Nutting of Fresno County is planting 40 acres to dates. His soil is sandy and to prevent loss of water and conserve labor has irrigation system of redwood fluming which means efficiency.

Irrigating Dates in Fresno County
Seedling dates on ranch of W. R. Nutting.

Saving Labor

MANAGER Niswander of the California Peach Growers is appealing to the trade to permit the saving of labor in cured peach packing as much as possible. In a recent circular he says:

"It has been the custom of jobbers in many sections of the country to require a very large percentage of their purchases of dried fruits to be faced, especially in 25-pound boxes. In view of the labor shortage that the country is sure to experience during the present year we appeal to you to cooperate with us to the end of inducing jobbers to specify the packing of their dried fruits unfaced, whether in 50 or 25-pound boxes.

"We believe that the jobbing trade can handle to advantage the coming season any line of dried fruit, even though it be not faced, and we hope, in no case, will a jobber specify facing on more than from 20 to 25 per cent of any car order. Dried fruits are faced only for display purposes, and a few boxes faced in each order should be sufficient for this purpose.

More than a thousand workers, including men and women, are engaged in California for several months during the late summer and fall in the facing of dried fruits, which we feel can be largely reduced if the trade generally cooperate with California shippers in this important matter.

"Consider this matter carefully, discuss it with your trade and advise us promptly as to the attitude of your trade in this direction."

NEW BRANCH FOR FOOD-INSECT CONTROL

To enlarge the campaign toward the control of insects infesting stored food products, a new section has been organized in the bureau of entomology of the department of agriculture. The secretary of agriculture has appointed to the new position Dr. E. A. Back of the bureau as entomologist in charge of stored-product insect investigations. This change allows Dr. F. H. Chittenden, who has heretofore carried on the food-insect work of the bureau in connection with investigation of truck-crop insects, to give his entire time to pests of truck crops,

Take This Advice

Buy building and plumbing material now. The prices will advance on account of large purchases made by "Uncle Sam" for his army. The man who buys now will make a profit on his purchase.

Our five story building at Ninth and Maple Avenue, Los Angeles, is crowded with stock purchased long ago before prices began to rise. You now get the benefit of our buying ability.

Lowest Prices in California

Special Paint Bargains

Large stock of reliable paint bought from bankrupt firms, now priced low to sell quickly. Interior washable wall, also cement paint, $1.50 a gallon. Regular $2.25 to $3.00 house paint, big assortment of colors (no white) on sale $1.50 a gallon. $3.00 red wagon paint now $1.50 a gallon.

FIVE CARLOADS of Vitreous China Toilets for which other stores pay $22.50, wholesale, we sell to you for $19. 5½ and 6-foot bath tubs for quick disposal $22.00.

WALL BOARD. Well known Cornell make, $30 per M.

ROOFING PAPER. 1-ply, $1.50; 2-ply, $1.75; 3-ply, $2.00 per roll.

a field also of great importance at this time.

Dr. Back left Washington this week to investigate the grain and food storage situation through the country. He will study present storage conditions and determine the needs, as they relate to insect control, for proper care of the food crops after the coming harvest.

Dry Wine Grapes for Hogs and Cows

WITH this year's abnormally high price for grain many vineyardists may find that the most profitable use of their wine grapes would be to dry them and feed them to hogs or cows. Feeding tests made by the University of California at the farm at Davis have shown that dried grapes may be successfully used to replace half the grain of the ordinary ration for hogs. They are best fed in connection with grain, alfalfa, and similar feed. While the acidity of the raisins is wholesome they may produce digestive disturbances in live stock if they form too large a proportion of the ration.

The grapes should be allowed to ripen as much as possible before drying as this will not only make the drying more rapid, but will much increase the yield per acre and the nutritive value of the dried grapes.

Eleven varieties of wine grapes grown by the university on a two-and-a-half acre plot at the Kearney experiment vineyard produced the following average yields; 3-year-old vines, 2.6 tons to the acre; 4-year-old, 6.2 tons; 5-year-old, 10.6 tons of fresh grapes to the acre. This was equivalent to .83, 1.98, and 3.39 tons of dried grapes respectively per acre. These crops, harvested last fall, if dried and now sold as feed for live stock in competition with the present price of $60 a ton for ground barley would represent a gross return per acre of $49, $112, and $200 respectively.

Figuring on a yield of five tons of fresh grapes to the acre as a reasonable average crop for wine grapes in the San Joaquin Valley and estimating $40 a ton as a selling price for dried grapes to be used as feed for hogs and cows, the gross returns would be $64 an acre.

Such use of dried wine grapes as feed for live stock would not be profitable at normal prices for wine grapes and normal prices for grain, but is one of the vagaries of war time prices for farm products.

Promise of Record Fruit Crop

Reports received by State Commissioner Geo. H. Hecke from the horticultural commissioners of the 45 fruit producing counties of California, showing fruit conditions on June 1, promise the largest crop setting on the trees in years. A shortage is noted in some localities in a few varieties, while other sections show above the average, and the new acreage coming into bearing should offset the losses.

The weather for the month of May, while cooler than usual, has benefited the grain crop and has not proved injurious to the fruit crop, except in one county—some sections of Sonoma County suffered a slight loss from a freak frost visitation, and yet this county as well as nearly all others of California shows a more optimistic outlook than a month ago. For example, by way of comparison, with the May reports:

Almonds made a gain of one point during the month, moving from 58 per cent to 59.

Apples lose one, from 93 in May to 92 in June.

Apricots show a handsome increase, moving from a 57 per cent crop on May 1 to 65 per cent June 1.

Other fruits as follows:

	May 1 Pct.	June 1 Pct.
Cherries	68	67
Figs	94	95
Lemons	91	91
Olives	96	96
Oranges	94	100
Peaches	83	86
Pears	99	89
Plums	60	61
Prunes	91	77
Walnuts	94	99

Because of the important bearing the fruit crop, California's chief food industry, has on the unusual world conditions more or less anxiety has been manifested, but Mr. Hecke now feels that with the usual care and continued favorable conditions a record crop of fruits may be prophesied for 1917.

OUTPUT OF STATE'S DECIDUOUS FRUITS

The following table gives the estimated per cent of the total crop of the principal California fruits grown in each of the main producing counties during a season of normal production. It is compiled from reports of the county horticultural commissioners by Geo. P. Weldon Chief Deputy State Commissioner of Horticulture.

Citrus Trees

Orange Lemon Pomelo Lime

Selected Buds (Pedigreed) from tested quality fruit and productive trees; Trees carefully propagated to produce a thrifty and prolific root system; Intelligently trained to induce a strong development of fruit bearing wood; Attentively dug and handled so as to insure growth when planted in orchard.

Owing to the late spring and cool summer there is no better time in which to plant citrus trees than right now, and particularly so if you will plant our bud-selected, well rooted, carefully trained and properly packed orange and lemon, pomelo and lime trees. We have been growing citrus trees for nearly a third of a century, and hence feel convinced we can please you; that if you plant Teague Stock your orchard under proper care will earn you dividends. Direct-to-you-prices on Teague Quality Trees will surely effect an economy in your citrus tree buying. Write us your wants.

THE R. M. TEAGUE CITRUS NURSERIES

The Oldest and Exclusively Citrus Tree Business in America

R. M. TEAGUE, Manager - - - SAN DIMAS, CALIFORNIA

"You will never regret planting Teague Trees."

Almonds are tied with last year's report, indicating 59 per cent for June 1.

Apricots showed 40 per cent last year and 65 per cent this year.

Peaches 68 per cent in 1916 and 86 per cent 1917.

Pears 63 per cent 1916; 89 per cent 1917.

Prunes 52 per cent last year and 77 per cent this year.

Other fruits show about the same ratio.

Preservation of Vegetables by Salt and Fermentation

VEGETABLES can be preserved more cheaply than in cans or jars and more simply, for household use, than by drying. The methods make use of the preservative qualities of salt and lactic acid, says a circular now being mailed by the division of viticulture of the University of California.

1. Preservation in Brine.—The vegetables are first washed, and sliced. They are then placed in a crock or barrel or other wooden vessel containing a strong brine. Metal vessels cannot be used. The brine is made by mixing 3½ to 4 pounds of salt to each gallon of water. All of this salt will not dissolve in the water, but the juices of the vegetables will dissolve the excess. The vegetables must be kept submerged by means of a well-fitting wooden cover weighted with a stone or similar object that will not be acted on by the brine.

2. Preservation in Salt.—Prepare the vegetables as above. Weigh them and take one pound of salt for each two pounds of prepared vegetables. A layer of salt is first placed on the bottom of a crock or barrel and then a layer of vegetables. Similar layers are alternated until the vessel is full, finishing with a good layer of salt. A wooden cover is then applied and weighted as in the first method. After a few days there will be a considerable shrinkage in volume and the vessel can then be filled with more layers and weighted as before.

These methods are suitable for most root vegetables, string beans, cabbage and cucumbers. The second is preferable.

The large quantities of salt used must be removed by soaking before the vegetables are eaten.

3. Preservation by Fermentation.—Cabbage, string beans, beets, and cucumbers can be preserved by covering them with a weak brine and allowing them to undergo spontaneous fermentation out of contact with the air.

The vegetables, prepared as above, are mixed with salt at the rate of one-quarter to one-half of a pound of salt to ten pounds of vegetables and tightly packed in a deep crock or barrel. They are then weighted down with a tightly-fitting wooden cover and a heavy stone. The salt and pressure force out the juice of the vegetables and they decrease in volume one-third to one-half.

If kept in a warm room (65 to 70 degrees Fahrenheit) a gaseous fermentation commences and continues for several weeks. This fermentation produces lactic acid, which preserves the vegetables. When the fermentation is over and the vegetables taste a little sour the liquid is drawn off and replaced with a brine containing one-half of a pound of salt to one gallon of water. In this they will keep in good condition for a long time if well protected from the air.

THE CHERRY COUNTY

The finest cherries we have ever seen we have just found in a box from Solano County. They were grown on the ranch of Millard Sharpe and put up in a most perfect pack. The layers were packed nine by ten, absolutely uniform, and even the selection for color was perfect. The cherries were of the Bing variety and of excellent flavor.

The state ships 250 to 300 carloads of cherries to Eastern markets. These have sometimes sold for as high as ten dollars per pound. We grant this is only an exceptional case where the first boxes of cherries reach the market very early. In addition the canneries pack each year 175,000 cases. Solano County produces more than any other one section, and nearly all the output is from north of Tehachapi. Only two sections in Southern California, in the mountains of San Bernardino County and in San Diego Couty, produce any cherries and this in very small quantity.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Paddy Rice for Chickens

Please advise if rice with hulls on is injurious to chickens when fed the same as wheat.—Subscriber, Sacramento County.

As noted in a former Cultivator, rice with hulls on or "paddy" rice is not especially desirable for any stock. That is, there is practically no nourishment in the hulls and they are extremely hard and indigestible. Fed in large quantities paddy rice might prove injurious. Answering our request for information as to the value of paddy rice for poultry feed, Prof. M. E. Jaffa of the state university writes: "I know that there is considerable of the rice paddy being fed by poultrymen and others. Personally I would not feed it for several reasons among which may be mentioned:

"The price of rice paddy is practically the same as that of rolled barley, wheat, oats, and higher than sorghum.

"Rice paddy consists of an average of 80 per cent rice and 20 per cent hulls. The hulls have no practical food value, or whatever they have is less than that of wheat straw. Furthermore there is some likelihood of the hulls causing trouble, as indicated by the statement found in Henry's "Feeds and Feeding".

Personally I do not think there is any comparison between rice paddy and rolled barley. I would certainly prefer the latter. I fully appreciate the fact that if the rice paddy can be ground finely there probably would not be the same likelihood of danger as when the rice hulls are fed, and furthermore the feeding of paddy rice is not as bad as feeding rice hulls themselves."

Address Wanted

We will be glad if H. C. Tracy, who wrote the hint, "Keeping Away the Rabbits" will send to the Cultivator his address, which has been lost.

Hogs Per Acre

How many hogs will one acre of alfalfa carry the year round?—Subscriber, Santa Barbara.

This query was referred to Prof. J. I. Thompson of the state university, who answers:

"We ordinarily figure that from 2000 to 2400 pounds of pork can be carried on an acre of alfalfa when grain is fed at the same time. When the ration is a heavy one, as much as 3000 pounds of pork can be carried. That would mean from 10 to 15 200-pound hogs or their equivalent. It is not very easy to determine how many hogs one acre will grow, producing all the feed necessary. Where only one crop of grain is secured it takes approximately six times as much grain area as alfalfa area. Where a crop like milo maize can be matured after a crop of barley has been taken off, it requires about three times as much grain areas as with alfalfa. Should skim milk be available in abundance, to supplement the grain, the land area for grain production may be reduced about one fourth."

Beans and Peas for Poultry

An inquirer recently appealed for information as to the value of blackeye beans for poultry feed. The question was referred to the college of agriculture, and W. E. Lloyd of the poultry division answers: "Cow peas or blackeye beans have a very high nutritive ratio, none of them being wider than 1:3.5. On the basis of their nutritive ratio they are excellent poultry feeds but from the standpoint of palatability when fed dry they are practically worthless. Some few of the peas will be picked up by the poultry but practically none of the beans. However, if they are steamed or soaked for 24 hours or put through any process which will soften them and give them a little greater succulence their palatability will be very greatly increased. These feeds are used to considerable extent in certain sections where they can be obtained cheaply. They have a very high percentage of digestibility. They are sometimes fed ground rather fine, in a dry mash."

Hen With Dropsy

An Orpington hen with a swelling below the vent as large as a man's fist was cut open and a great quantity of water came out. This one and another like her lay bloody eggs (inside) with some white adhering in lumps and the yolk together with a slight odor and disagreeable appearance throughout. Are the eggs and flesh fit to eat? They are fed rolled barley and kafir three to one and the C.P.A. mash, also kitchen scraps and green feed.—Subscriber, Los Angeles.

The hen with the abdominal swelling probably has dropsy, a disease which is rarely curable. Letting out the water was all right, and a one-grain dose of iodide of iron daily might be helpful, but if she is old or not specially valuable it would be better to save yourself trouble by killing her. If there is no fever or other evidence of inflammation the flesh may safefly be eaten.

The blood in the yolks of the eggs comes from a rupture in the ovarian follicle and indicates unusual activity of the reproductive organs. These cases usually occur in the spring when the hens are doing their best laying. Such eggs should not be marketed, but may be made fit for use at home by removing the blood spots. If this cannot be done because of the size of the spots, boil them and use for chick feed.

USE LIME

Prices of most commercial fertilizers at present are high. Potash is almost unobtainable.. Only by most scrupulous conservation of stable manure, and an increased use of legumes as green manure, and of ground rock phosphate, can the commercial fertilizer shortage be met, even temporarily. There remains one thing, however, that may be done to increase yields, which costs no more now than it did before. It may safely be said, I believe, that if all sources of artificial chemical fertilizers failed, our total farm output in many sections could not only be maintained, but even increased for a considerable time simply by the application of lime to acreages that now are low in yield or lying fallow because they are too sour to grow profitable crops. Lime can and should be put on all sour land. By a plentiful use of lime we can, figuratively speaking, make our "war bread" of stones.

EXPERIENCE

Years of Caterpillar-building—thirty-four years of tractor-building experience—and today Holt is acknowledged the world's greatest tractor manufacturer.

There's but one Caterpillar Holt builds it

Thirty-four years' experience in tractor-building has developed the most expert workmen, the strongest, longest-lived construction, the greatest tractive power, found only in Benjamin Holt's great invention, the Caterpillar.

The result to the Caterpillar owner is lowest cost per working hour—and therein lies the Caterpillar's success.

Unsigned communications receive no attention.

Bloody Milk

Recently purchased a nine year old high producing Jersey cow, fresh but a few weeks. Slightly bloody and curdy milk began showing in one quarter with slight swelling in the udder. Bloody milk showed but a few milkings but curdy milk continued. Rubbing with hot oil took down swelling but cake continued and milk flow almost ceased. The trouble is showing in the other quarters, but have kept it in check by rubbing with hot oil until now when it seems to be worse. On advice of a neighbor have been using teat tube and injected peroxide of hydrogen.—Subscriber, Alpaugh.

Your treatment has been all right so far as the udder is concerned but you must cool out the whole system. The udder may have been injured to start the irritation, but the system must be in a feverish condition or the irritation would not continue and extend to the rest of the udder. First give her a physic of one pound epsom salts, half pound common salt and two drams powdered nux vomica. Dissolve all in two quarts hot water and when cool give at one dose as a drench. Then mix two pounds epsom salts, one pound common salt and half pound saltpetre. Give handful of the mixture once a day. Be sure she gets plenty of water to drink and feed her green stuff to keep the bowels loose. Be sure that the udder is milked out clean twice or oftener each day.

Pigs Ailing

About a year ago I had the experience of hand raising a litter of eight pigs. All went fine for about two months and the pigs grew like weeds. One day I noticed that one had his head tipped sideways. Soon another had no control over his gait. Some of them would circle around. A cough was prominent and some vomited. I raised only three of them. Last week I brought 12 pigs from pasture that are about three months old but now find that they also have a similar disease, only some act as if they had pain, stretch out, quiver and paw as if in a fit or lift a front foot as if in a cramp. They are fed skimmed, sweet milk, fresh green alfalfa and barley. Please advise what to do for them. Also have a pen of 14 fat hogs that are all right. Do you think this is cholera?—Subscriber, Hood City.

It is not the contagious cholera. I believe the whole trouble is with the skimmed sweet milk. Milk from a separator has air in it and will cause indigestion. It is hard to raise any young animals on such milk. Put the milk in a barrel and let it sour. Soak the barley in the sour milk for some time before feeding it. Sour milk after making butter the old fashioned way was fine for fattening hogs. Lactic acid as you find it in sour milk is fine for digestion and very wholesome.

Swelled Udder

Have a heifer just two years old that was bred the 11th of last December. About a month ago her udder began swelling and got worse until it interfered with her walking. She was in the corral and getting no exercise so we put her out on pasture, gave her a dose of salts and began rubbing the udder with a mixture of lard and camphor. She does not seem to mind the rubbing and the udder is not sore. Her general appearance is not good. She is logy and does not show any life. What is best to do for her?—Subscriber, Valyermo.

Examine the heifer carefully to see if the calf is still alive. It may be dead and have to be removed. If a good veterinarian is near consult him. You did not say whether you were milking her or not; would advise milking her twice a day. Rub the udder and milk out all you can get. Examine her on the right side for the calf, and if there is any motion do

How the Crop Volume May be Increased

Written for California Cultivator By E. W. McCullough

SINCE the government has furnished figures to show what our food reserves are in the raw state it has had no difficulty in securing cooperation from all classes in urging everywhere increased planting and making it clear that labor in connection with agriculture at this time is as truly a patriotic service as going to the battle front.

The farm equipment industry, which is one of the largest single lines of manufacture in the country, has for years kept pace with the demand, and competition has so quickened the wits of these manufacturers that today this industry leads the world in producing not only the greatest volume of labor saving machinery but the best found anywhere throughout the world.

Our allies passed through an experience by which we could profit, for in response to the alarm of war the demand for munitions seemed paramount and it was nearly a year before they realized that the food problem was the greatest they had to contend with. Then they began a hasty scramble to rearrange their plans and systems to meet it. The time lost by this delay has not only proven serious but undoubtedly would have been vital if we had not joined with them in the struggle.

In order to do our part satisfactorily, we shall have to move rapidly, for agriculture, unlike manufacturing, is seasonable and, as with time and tide, waits for no man. The manufacturers of implements and farm machinery have suffered serious delays in securing materials during the past three years owing to the congestion of orders at the mills and in transportation. Therefore the production has been below normal. This year these delays have been greater than ever before, and had it not been for some of the railroads placing agricultural implements on the preferred list where embargoes existed, much of the country would have been without adequate equipment to put in this year's crop.

It is fortunate that the manufacturers have had the capacity to meet the demands upon them up to this time, but they are now confronted with a most serious condition in looking forward to the manufacture of implements for use this fall and next spring, because of our government requiring extraordinary amounts of material for war purposes, which naturally must be given precedence over all ordinary demands.

Plowing in the Southwest for fall will follow the June wheat harvest and will gradually progress with the season to all other territory. Consequently the manufacturer must order his materials now and have assurances of deliveries, or it will be impossible for him to plan his production intelligently. If tillage implements are not provided when needed the passing of the season renders them useless until the proper time again arrives, and in this respect the situation with these manufacturers is different from that of most other lines.

Efforts have been made to bring these important facts before those who determine the apportionment of materials to industries which should have preference for the protection of our food supplies. It is hoped that the seriousness of the situation will be so realized that early action will be taken to prefer the necessary materials and labor used in the construction of labor-saving farm equipment, and further that the shipments of this material, not only in the raw state, but when completed, will be permitted quickly and without unnecessary delay.

This is not an instance of an industry asking to be preferred over another, for these manufacturers have already tendered their plants to the government, but it is believed in this present emergency that they can render more efficient service in turning out tools suitable for agriculture than if they were required to produce munitions or other war equipment.

It is hoped therefore that the seriousness of the situation may arouse general interest in this contingency and that all who are disposed to do their bit may see here an opportunity for rendering help. Our farmers, our business men, our agricultural colleges, and all organizations which realize the importance of increasing food supplies may with propriety write to our constituted authorities relative to this matter, until by reason of volume of interest steps may be taken which will provide the desired relief.

A short time since we did not consider that this was our war, but today it is generally realized as our greatest responsibility and that we must move and more quickly.

More About Corn

By Mr. McCloud Before Stockton Demonstration

AT the corn demonstration recently held at the Sperry Flour Mills at Stockton more than 200 corn growers were present. Among the helpful talks was the following by Mr. McCloud of the Sperry Company.

The California grower has, up to last year, been harvesting his corn a good deal like the Indian 300 or 400 years ago. One of the greatest troubles we have had is that corn delivered in the early part of the season arrives at the mill with a moisture content ranging from 16 to 20 per cent.

From some experiments made we thought it possible that by using binders and cutting it about the time it began to glaze, in many cases the corn could be harvested with a low percentage of moisture, without going into the crib. Corn begins to glaze pretty well about the 10th to the 15th of September and could be cut then. You would have hot days from the 15th of September until about the first of November that would more than offset any cold nights that we have here in California.

If the grower allows his corn to stand on the stalks and can market a small proportion of it the latter part of November with a moisture content

ranging from 16 to 22 per cent by harvesting with a corn binder he ought to be able to market a large proportion with a 15 per cent moisture content two weeks earlier.

A good many people are afraid that the corn business will be overdone, but there are many different channels that corn will go to when people find out the actual value of corn. Corn has 10 per cent more feeding value than barley, 7½ per cent more than wheat. Take for instance the hog industry. California raises only about one-third of the pork it consumes; the rest is brought in from the Middle Western states. There is no state better adapted to raising hogs than California. Hogs can be raised on alfalfa pasture at small expense and could be finished off by feeding corn, in three to five weeks' time.

The poultry business in this state is growing every day. It takes a larger percentage of corn to supply the poultrymen, and some poultry centers buy more corn today than we use here in our mills at Stockton.

I think that several of the growers here today have already purchased some of this machinery, and I believe that in another two or three years every corn grower will not only cut down the expense of harvesting, but will also be able to take advantage of an early market. The best market would be the latter end of the old crop in the East, which would be in October, November and December. Of course these are war times and the markets are fluctuating widely. If you are able to market your corn at this time you are going to get high prices in the first place, and you are going to do away with a good deal of cribbing and interest on your investment from December to March.

Some of the corn being delivered now runs as low as 11 per cent, other lots as high as 18 or 19 per cent.

This method of gathering corn is practiced in a good many of the corn states—about half and half from the information I can get; it has been tried out and found thoroughly successful. Has this been done in this state at all? There is a gentleman whom I wish I could have had here to talk to you. About the latter part of September or the first of October he had quite a patch of corn. It was just beginning to glaze. It was about 14 feet high, and the ears on the corn were completely shaded. He cut the corn when it was in heavy glaze, and shocked it. That is the corn stalks they have been running through the husker and shredder today. You can see that it is fully matured and has a better color than some of the corn harvested the other way.

I have looked up an analysis on corn stover and found that it has half the feeding value of ordinary hay, and as a rule corn in a green state produces about 12 tons of fodder to an acre. This will make 2½ to three tons of dry corn stover and would be worth ordinarily $2.50 to $3.00 a ton but today with hay at $30 would be worth about $12 a ton.

I was talking with a man last fall who mentioned the fact that his company had 23,000 head of sheep down on the Delta lands and would like to feed as many more if they just had something like corn stover to carry their sheep along and keep them in good condition.

How many tons of fodder to the acre? 2½ to three tons—12 tons of green fodder with the moisture out will run down to two or three tons.

We made an experiment last fall in a small way. There were two corn fields located about four miles from Stockton, and we selected the greenest stalks in the field, the ears of which were just beginning to glaze, and placed them in bundles in an open lot to mature. The ripest corn in the field was commencing to get hard and as deep a color as when thoroughly ripe. At the end of 25 days the corn cut and shocked when in the glaze, was more mature than the ripest of the corn left standing in the field. This one experiment satisfied us as to what these corn binders would do. They would advance the maturing of corn 15 or 20 days and make a very large percentage of the corn marketable without being put in the crib at all.

Soil Survey

The bureau of soils of the department of agriculture has made a soil survey of the Ukiah area of Mendocino County. The report of the survey just published by the department contains a soil map of the county, on which farmers may find the approximate location of their farms, and 53 pages of text describing the various soils, discussing their capabilities, and suggesting means for utilizing them to better advantage.

The area covered by the survey comprises the valleys of the Russian River and its large tributaries within Mendocino County and a portion of the coast range mountains, covering in all 303 square miles or 193,920 acres. Definite districts listed within the Ukiah area are Potter, Redwood, Cold Creek, Calpella, Coyote, Ukiah, Knights, Sanel and McDowell Valleys.

The report includes a brief historical and geographical sketch of the region surveyed and statistics relating to its climate. Hops is one of the principal crops, while considerable acreage is devoted to grain and alfalfa. Grapes are grown more extensively than other fruits. Live stock is raised on the rolling hill pastures. Fruit growing, the report states, seems destined to be an important industry in the area. On the whole, it is pointed out, the climate is well suited to the production of general farm crops, alfalfa, hops, grapes, and most tree and bush fruits. Though it is not well suited to citrus fruits, there are some areas and hills from 500 to 1000 feet above the valley floors where oranges can be grown, but the area of suitable soil in these regions is very small.

TO FIX AUTO PUSH RODS

Push rods on an auto engine, after long use, become worn and get noisy, writes R. A. Bradley of Colorado Agricultural College.

To adjust them, you will generally find two nuts or a screw and lock nut which you can adjust by loosening the lock nut, and screw the pin out until you have about the thickness of an ordinary business card between the two, being certain that the push rod is in its lowest position.

If no such adjustments are provided, you will either have to draw out the valve stem or take a rod about one-eighth of an inch larger than the stem, drill a hole in the end the size of the stem to a depth of one-eighth of an inch, then cut off long enough to leave a small cup with the bottom in, then dress wih a file until you get the proper clearance.

Two farmers' bulletins recently issued which are of interest are, "Commercial Handling, Grading and Marketing of Potatoes" and "Cotton Ginning Information for Farmers."

The cotton ginning bulletin touches upon separation of seed for planting, the usual ginning process, ginning machinery. The principal value of this bulletin to the general farmer is in its giving an idea of methods of ginning.

The potato bulletin touches upon handling of early new potatoes, need of standardization, containers, brands, loading, marketing, shrinkage, etc.

You Ride the Tool —Not the Tractor

See how the operator of a Moline Universal Two-Wheel Tractor *sits on the seat of the implement* just as he would if he were driving a team. You know you couldn't ride your horses and do a good job of cultivating, plowing, drilling, mowing or any other kind of farm work. Neither can you do it with a tractor. With the Moline-Universal Tractor you sit where you can watch the work the implement is doing. You simply guide it with the steering wheel—easier than you can guide a team—everything is right at your finger tips with plenty of power. You can work as many hours as you wish in all kinds of weather—on all kinds of jobs.

MOLINE ORIGINAL 2 WHEEL TRACTOR UNIVERSAL TRACTOR

Does All Farm Work Without Horses

(127)

—It is heavy enough to do all farm work, yet light enough to work on soft plowed ground without packing the soil.
—It will *cultivate as well as plow.*
—It will do your discing, harrowing, planting, mowing, haying, harvesting—in short, anything you can do with horses and all belt work on the average farm.
—It will do all this easier, quicker, cheaper than with horses.
—It pulls the load of 5 horses and furnishes 10 to 12 horse power on the belt.
—It is made and backed by one of the oldest, strongest, most dependable farm implement companies in the world, and built in the largest tractor factory in the world.
—It is the *only* tractor which will do all farm work without horses.
—It is low in first cost and inexpensive to operate.

The Moline Line Includes:
Corn Planters, Cotton Planters, Cultivators, Corn Binders, Grain Drills, Harrows, Hay Loaders, Hay Rakes, Lime Spreaders, Mowers, Manure Spreaders; Plows (Chilled and Steel), Reapers, Scales, Seeders, Stalk Cutters, Farm Trucks, Vehicles, Wagons; also Stephens Six Automobiles

Costs Less Than 4 Horses Does the Work of 7 Horses

Write for our Catalog Folder and read how everywhere farmers are solving the power and hired help problems on their farms; how they are doing their farm work easier, better, quicker, and making more money. Learn how you can make your work easier and get it done on time and grow bigger, better crops. Write today.

OUR ADVERTISERS RELIABLE
We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The roasting ear on the cover is almost real enough for one to make a meal on. We hope it will induce more planting of corn in California. Material addition to the kitchen supply is given by a patch of sweet corn. There will be canned corn and dried corn. Speaking of dried corn takes one back to barefoot days, and honestly we believe nicely dried sweet corn is far superior to the canned article.

MAXIMUM PRICE

We doubt not that with hungry Europe demanding our wheat and with our short crop there may be some form of food control necessary. But as to maximum price the farmer is saying "If maximum prices on our products, then give us maximum prices on the wherewith to produce crops or we perish."

Certainly there should be some method of control or rather prohibition of speculation in food stuffs but in getting the speculator don't "get" the farmer.

PRODUCE MORE

The government crop report sent out from Washington June 8 gives fairly definite information that our crops will be greater than those of last year. The June 1 forecast shows a probable production of 656,000,000 bushels wheat; last year's crop was 639,886,000 bushels—not a great increase, but a most fortunate showing considering the fearful losses from winter killing all over the Middle West. California's estimate is 5,610,000 bushels, only 10,000 bushels greater than its production last year.

The June forecast on barley is 214,000,000 bushels, while last year's crop was 180,927,000 bushels. California little better than holds its own, for the estimate was for 35,100,000 bushels, while last year's production was 33,320,000.

In sugar beets the June 1 condition was 95 compared with the ten year average of 92 in California. The United States over the condition was 93.7 compared with the ten year average of 89.7.

Cotton looks bad. In California the condition is 82 compared with the seven year average of 94. The Imperial Valley has had some very cold weather which cotton has not enjoyed. Its average is better, however, than in the entire United States which shows a condition of 69.5 compared with the ten year average of 79.1.

In the matter of prices all precedents are upset. Wheat in California on June 1 was quoted at $2.65 while its ten year average is 98 cents. The average for the United States on wheat was $2.48½, while the ten-year average is an even dollar per bushel.

FAIR POSTPONED

The directors of the District Fair Association of California which had planned for a great 30 day fair at Exposition Park, Los Angeles, October 20 to November 17, have canvassed the situation with regard to the war and the greater responsibility and necessity for greater production generally facing the people of California and have decided to postpone the fair indefinitely. Members of the association have expressed a wish that it now begin planning for a great fair in 1918.

There is need for every encouragement of greater effort toward production that our armies and the armies of our allies may be fed, and there is need that every activity of this country which will strengthen it at the present time should be encouraged, and the directors felt that in postponing this fair they took the best step to that end. Many of us still feel that this would be best accomplished by maintaining so far as possible our regular activities. We believe that special impetus is given to greater and better production by a well managed agricultural fair and we hope that the 1918 event in Los Angeles will be a complete success. We believe the state fair and all the district fairs in the state will be held.

SECURE FARM LOANS

The president of the federal land bank branch at Berkeley announces that actual loans to members of the federal farm loan associations begin this week. June 15 is the date set for the first loan. Appraisals in many sections of the state have been completed and federal money will soon be in the hands of growers. This great movement is being watched with interest, and it is believed that for the first time in the history of this country rural credits will have justice. The development of every rural community will be stimulated by this cheap rural credit. It will be vastly different when a farmer can pay six or six and a half per cent and in a period of 30 years have these small payments liquidate not only the interest but the principal, where he has been in the habit of paying seven or ten per cent or—as we have known in one case—17 per cent interest, and the principal still remained to be paid.

To increase its funds the federal farm loan banks will issue bonds. These bonds will soon be on the market. We have just ended one campaign for liberty bonds. Those who are disappointed in not securing liberty bonds may perform an equally patriotic service in subscribing for these federal farm loan bonds.

COLD STORAGE

The demands for preparedness, coupled with "needs" of pork barrel legislation, have lowered the available cash of the federal government. One suggestion for bringing in funds is to subject to tax foods placed in cold storage. This suggestion has perhaps been put forth because of charges often made that the beef barons and others are making great profits by storing away and speculating on foods. This may be true to an extent, but it is also true as to all products that there is at times speculation.

The only salvation for the farmer is cold storage, and it would be a serious error on the part of the federal government to discourage this method of preserving foods, thereby bringing gluts at times when the farmer would receive practically nothing for his products.

LIBERTY BONDS

The Cultivator Liberty Loan campaign ends most satisfactorily. During the past week 27 separate bonds have been purchased ranging from $50 to $500. One subscriber, Wein M. Grothe of Cummings, Mendocino County, subscribes for a $500 bond. While none of these subscriptions are large, nor is the number great, it is an indication of the willingness of America's millions to do their patriotic duty and advance the cause of Liberty.

BOUGHT YOUR BOND?

Subscriptions to America's liberty bond for $2,000,000,000 closed on Friday noon. The Cultivator goes to press before it can be learned as to how heavily it was oversubscribed. We feel safe in making the statement that it was oversubscribed.

It took some time for the American people to wake up to the fact that liberty bonds were to be preferred to Prussian bonds, or, as one slogan puts it, "bonds or bondage," but when the awakening did come a whirlwind finish was given to the campaign. And the best of it is that the subscriptions have come very largely from those whose earnings are not large. True, many large financial institutions have announced large purchases, but we believe that as a rule these are for the purpose of passing on to others in small amounts. This gives the greatest satisfaction to every well wisher of the country, and for patriotic and for economic reasons. It will be good for the country, it will be better for the individual.

A very few insisted to the last that it was a movement for the capitalist, not the poor man. As one expressed it, "Let the big capitalists buy," but to him reply was given that this is not the land of the big capitalist but of the true American. Another refused to buy a bond because the administration at Washington was not to his liking. Would he be willing to concede that this country of ours belongs to any administration? This is the work of the people and to preserve the liberties of the people. The majority rules or our nation ceases to be one ruled by a free people.

We should not forget that France paid to Germany after the little scrap of 1871 an indemnity of $1,000,000,000, and that this indemnity loan was liquidated only a very short time before the present war broke out.

Those who have subscribed have the satisfaction of doing at least a bit of service in advancing the cause of liberty in this world of ours, and from a selfish standpoint have made an investment in a nation which has the best credit of any nation on earth.

Agricultural Notes

Chile produced 20,000,000 pounds of wool last year.

The United States government is considering restricting sale and export of mares.

California last year harvested 9700 acres of potatoes; this year 19,400 acres are planted.

Alaskan farmers have entered into a cooperative exchange system with merchants so that market is assured.

Export of agricultural machinery from France has been prohibited by the government. The order went into effect May 27.

Keep pigs instead of chickens is the government's advice to Englishmen. The argument is that the cost of feeding is much less.

The food controller of Great Britain has since May 17 requisitioned all supplies of beans and peas and all shipments arriving.

The 1915 olive crop of California is estimated to have produced 1,000,000 gallons of oil and 1,800,000 gallons of packed olives.

The war and navy departments have authorized contracts for purchase of 3,450,000 pairs of shoes, deliveries to be completed in eight months.

Because of shortage of shipping facilities South African fruit growers are confronted with a problem in the disposal of their surplus of grapes, apples, pears, etc.

On the Shoshone project in Wyoming there were 3000 acres of unentered public land for which the government contracts to furnish water and seed for one-third of the crop.

In spite of big demand in the United States and Europe for camphor the trade from South China is practically dead. This is because all this business was in the hands of German traders.

The railroad war board recommends discouraging of conventions which stimulate passenger travel until the railroads are more nearly able to handle the freight business that is being offered.

The China Commerce Club, to promote commerce between China and the United States by intensive study of the problems involved, has been formed with headquarters at San Francisco.

Italy has been unable to ship citrus fruits to Denmark, Norway or Sweden the past year and has been forced to dispose of the quantity usually sent to those countries to Egypt, Greece and other Mediterranean markets.

Fruit exports from the United States during 1915 were valued at $34,229,906. The values of the principal fruits exported were: Apples (dried, green, or ripe), $11,358,124; apricots, dried, $2,241,061; oranges, $3,851,013; prunes, $3,274,197; and raisins and other dried grapes $1,718,547.

Agricultural News Notes of the Pacific Coast

Northern California

Yolo County reports an acreage of 131,885 planted to barley.

Experiments are being made with cotton planting in Yolo County.

P. H. Green of Willows last week shipped 200 head of cattle to Denver.

Napa County's prunes and pears are showing up a 100 per cent crop.

The Ehmann Olive Company is making plans to double its plant at Oroville.

A number of canners in Sutter County have contracted for cherries at $145 per ton.

Holstein breeders held a meeting at Chico Tuesday night during the big sale at Vina.

Report of the Glenn County farm adviser shows the hay crop to be 20 per cent above the usual output.

Five thousand acres of rice in Glenn County have been signed up by owners in the Pacific Rice Growers' Association.

Continued cool weather has delayed ripening of fruit in Solano County so that shipments are going out rather slowly.

Lake County has planted heavily to Bartlett pears this year, over 40,000 trees being put in. Prunes are the next heaviest.

A new raisin plant is to be built at Marysville by the California Raisin Company. The dryer will handle about 60 tons of green grapes a day.

Leroy B. Smith, who has been agricultural instructor for the past two years in the Placer Union high school, has been appointed farm adviser of Fresno County.

A half brother to the grand champion steer at the Chicago International has been sold by the university farm to J. H. Bunting of the Mission San Jose for $1000.

Over 6000 head of sheep have just been unloaded at Montague, Siskiyou County, by the Western Sheep Company. They were sent to grazing fields south of Montague.

A campaign to abolish dehorning of cattle has been started by the state humane association. The prevention of the horn growth by application of caustic potash is recommended by the society.

Dairymen about Folsom, Sacramento County, have started their stock to the mountains for summer pasture. The cattle are driven to Roseville or Rocklin and there shipped to Truckee or other points in the mountains.

Farm Adviser Amundsen of Placer County announces local farm bureau meetings at Long Valley June 16, Loomis 18, Bowman 20, Mt. Vernon 23, Roseville 25, Sheridan 26, Colfax 27, Butcher Ranch 28 and Forest Hill 28.

The University of California is giving special war emergency courses at Berkeley. These will close June 23, before the start of the summer session. There will be aviation courses, courses in first aid, making of hospital garments, surgical dressings, etc.

The prize for the heaviest hog at the Butte County Fair went to H. P. Slocum & Sons of Glenn County, and to Hayden Smith of Woodland, joint owners of Uneeda Wonder, a Duroc-Jersey boar recently imported from the East. The animal weighed 700 pounds.

Central California

June 9 was Farmers' Day at Lindsay.

A large grain crop is being harvested around Modesto.

Shipment of the 1917 Valencia crop has commenced in the Lindsay district.

The 1916 raisin crop has been taken off the market by the Associated.

A big navel crop is reported setting in the Terra Bella district of Tulare County.

The Tidewater Southern Railway is now laying track between Clark and Ortega on the Stockton division.

The California Associated Olive Growers' Association is planning to establish an olive mill at Lindsay.

Ceres began shipments of peaches on June 4, when a quantity was sent to Seattle and San Francisco markets.

Water was turned into the east end of the Terra Bella irrigation project on May 30 and put to immediate use by orchardists.

The executive committee of the Stanislaus County farm bureau is acting as an employment agency to supply labor to farmers.

A committee of five has been appointed by dairymen of the San Joaquin Valley to work out plans for a permanent association.

The Prune and Apricot Growers' Association has established itself in headquarters at San Antonio and Market Streets, San Jose.

The newly organized Deer Creek Citrus Association of Tulare County has elected Frank Wheeler president, Fred H. Gerdes secretary.

The San Joaquin County farm bureau announces local meetings at Lockeford June 11, Linden 13, Bellota 14, Manteca 15, Escalon 18, Ripon 21.

The Satterwhite pure milk bill has been signed by Governor Stephens. It extends regulation and inspection to butter, ice cream and other milk products.

Honors for the highest butter fat test of April in the Tulare County Cow Testing Association were held by Lenoretta, a Holstein-Friesian owned by W. J. Higdon.

Grape growers and packers met in conference at Fresno Saturday, June 2, and took preliminary steps toward the formation of a grape protective association.

Fresno County expects to have a new farm adviser appointed by July 1. The chamber of commerce has been so notified by B. H. Crocheron, state leader of the division of agricultural extension.

A temporary organization of the San Joaquin Valley Dairymen's Association was perfected May 25 at Fresno. Practically every county in the valley was represented. It is proposed to make this a unit of the state organization.

The Northern Tulare County Citrus Association has purchased orange packing machinery and leased a packing house for use for three years. Packing began June 1.

Earlier reports of serious damage to the peach crop of Tulare County are now reported to be much exaggerated, the crop in most sections being as heavy as last year.

Southern California

The first carload of cantaloupes left Brawley for New York on June 4.

A labor survey is being taken in the Hemet Valley, growers and laborers both signing up.

The Charter Oak Association returned last season $91,000 to growers of navel oranges.

Dr. B. J. Cady, in charge of hog cholera work in California, has been stationed in Imperial Valley.

Santa Ana has secured establishment of a woolen mill which it is expected will begin work this month.

The Riverside County farm bureau has headquarters on Ninth Street between Main and Orange, Riverside.

A citrus by-products laboratory has been established by the United States bureau of chemistry in Los Angeles.

Woodland, Riverside County, is to open a municipal market where vacant lot cultivators may display their wares.

Plans are being made for the Eighth National Orange Show to be held at San Bernardino February 20-28, 1918.

Suits have been filed against three members by the Poultry Producers of Southern California for selling eggs outside the association.

The Moorpark Enterprise reports the apricot crop of that district of Ventura County as much better than it was earlier thought possible.

The state commission of immigration and housing reports receipt of many requests from farmers for aid in installing model labor camps.

The city council of Riverside has appointed a vacant lot adviser whose duties will be to aid in getting vacant lots in the city under cultivation.

Brawley is now sending out carload shipments of cantaloupes. The shipments are much later this year than usual on account of the cold weather.

Geo. W. Shaw, appraiser for the farm loan bank, is in the Imperial Valley to inspect properties approved by the various farm loan associations.

Prices to be paid by the sugar beet factories will range, it is stated, from $4.50 to $11 a ton, according to grade of beets and retail price received for the sugar.

The Imperial County farm bureau announces local meetings at Calipatria June 11, Westmoreland 13, Magnolia 15, Seeley 18, McCabe 20, Mt. Signal 22, Eastside 25, South Fern 27, La Verne 28.

Orchard heater tests were made at Pomona last Tuesday, Wednesday and Thursday nights. Effort is being made to secure a heater which will give the maximum amount of heat with the minimum amount of smudge.

At the recent meeting of the California Avocado Growers' Association the following directors were elected: H. J. Webber, F. O. Popenoe, Charles D. Adams, T. U. Barber, William H. Sallmon, W. L. Hardin, B. H. Sharpless, Thomas H. Shedden and E. E. Knight.

The government bureau of markets is again this year cooperating with the cantaloupe shippers in the Imperial Valley. E. D. Baker of the department, assisted by E. G. Roberts, has headquarters at Brawley, where he receives and quotes daily bulletins of crop conditions in the East.

The Coast

The Oregon State Grange held its annual meeting at Astoria June 12.

Wool prices in the Northwest are 100 per cent higher than last year.

Cove, Oregon, will hold its Cherry Fair on June 19. The crop is a large one.

The broccoli crop of Lane County, Oregon, is expected to reach 60,000 crates.

Yakima County, Washington, is planting 1600 acres to beans this spring.

The Washington State Grange met last week at Wenatchee in annual session.

J. C. Flaherty has been appointed county agriculturist of Yakima County, Washington.

A campaign is being made to secure planting of 10,000 acres of beans near Eugene, Oregon.

Farmers of Jefferson County, Oregon, are planting to the limit of wheat and potatoes.

Over 50 members have already signed up in a bull association on the Tieton Project, Washington.

Fruit inspectors report good prospects for a big crop of fruit on the Snake River farms in Washington.

The Fruit Growers' Association of Eugene, Oregon, is reporting very heavy demand for loganberries this year.

Fifty cents a pound is being paid for butter fat in Eastern Oregon because of shortage of hay and its high price.

Four hundred organized farm loan associations in the Spokane district of Washington have applied for loans aggregating $20,000,000.

The acreage of spring wheat will be greatly increased in Harney County, Oregon, most of the new land being of the dry farming type.

The department of agriculture of the state of Washington has sent an inspector to Los Angeles to inspect potatoes before shipment to his state.

The board of directors of the Skagit County, Washington, Fair Association has announced prizes for dairy and beef cattle for their fall show.

J. W. Clise of Redmond, Washington, reports shipment of a carload of 25 young Ayrshire bulls and a carload of heifers from his Willowmoor Ranch.

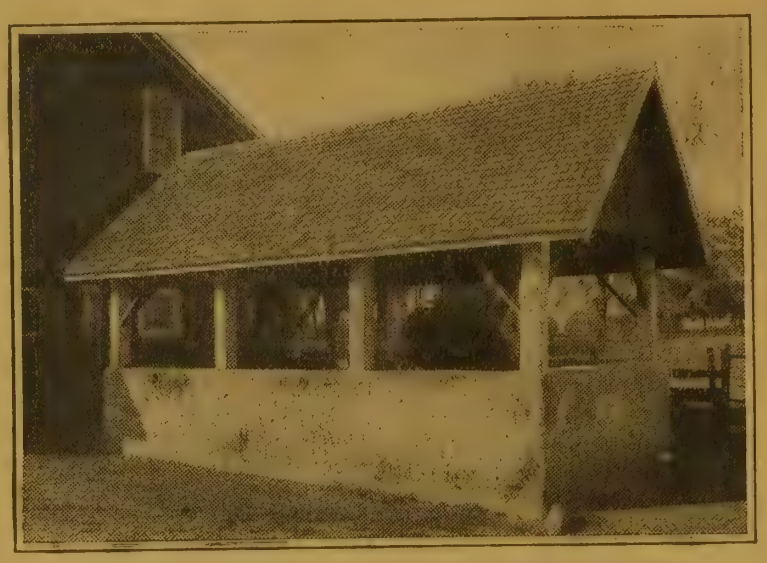
Polk County, Oregon, is planting the biggest bean acreage in its history. Practically all the lands formerly planted to hops are this year put in beans.

Older alfalfa fields in Gem County, Idaho, have been somewhat damaged by cold dry winter. A good many of these have been plowed up and put in spring wheat.

The Hood River Apple Growers' Association has elected C. W. McCullagh sales manager. He was previously sales manager for the Yakima Valley Fruit Growers.

The Fruit Growers' Association of Eugene, Oregon, has been awarded a single contract to supply $400,000 worth of canned turnips, carrots, cabbage, squash and green beans.

Pledges have been secured sufficient to guarantee a 50,000 ton output of sugar beets at Toppenish, Washington. This will assure establishment of a sugar factory at that point.



A good type of concrete manure pit. The roof keeps out excessive moisture and screens may be attached to the posts to prevent the breeding of flies.

Get the Most Out of Your Acres

IT is the patriotic duty of every farmer this year and next to plant every acre possible to supply food for the world.

To get the biggest crops the fertility of the soil must be kept up. Barnyard manure must be depended upon to do it. But the manure must be properly stored. When piled on the ground manure loses a lot of its value by the draining away of the liquids. Rains wash it, or it frequently "fires" because of lack of moisture.

Build a Concrete Manure Pit

Manure will keep without loss of fertilizing value in a concrete manure pit. The liquid manure is saved. Nothing is wasted. The labor of handling is very much reduced.

Concrete is used for great reservoirs and tanks which must be moisture-proof. That's why it's best for similar farm uses.

Concrete manure pits can be easily and cheaply built with ordinary farm labor. All you need is sand, pebbles and portland cement. Our free, illustrated booklet No. 142 will tell you how to make one. Write for it today.

Chester Whites in the Sacramento Valley

Written for California Cultivator By C. B. Cunningham

IS the white hog more susceptible to climatic conditions than others? Speaking only from personal experience, I state that they are not.

In the spring of 1909 I bought my first Chesters, although I was advised that they would not do well in California, that they could not stand the heat, would sunburn, scald, blister, scab, get mangy and in fact possess all the ailments and bad features of swinedom, and have no redeeming qualities whatsoever. I looked into the Chester breed pretty thoroughly; what it was, had done and was doing; corresponded with many, read what I could get hold of on the subject and finally decided that if in the Middle Western states, where climatic conditions are so much worse than in California, hotter in summer, colder in winter, with cyclones, blizzards, sleet, snow and slush, they were such a pronounced success, they certainly would do as well in California and should do even better. My venture has been a success.

I find that the white color in summer is as cool on the pig as it is on the human. So that as far as standing the heat was concerned they could do so as well, if not better, than the other colors. Now about sunburn; all hogs will burn more or less if during the extreme heat of the day no shade is provided. Any breeder of swine knows, or should know, that ample shade is an absolute necessity during the hot summer days for all swine irrespective of breeds or color. Different individuals may have more resistance to certain things than other individuals of the same breed; all hogs however will get scabby if the lice and vermin are not kept off of them and they are allowed to run around in muck and have free access to manure piles, etc. The white hog will show this more readily than the darker hogs the same as white goods will show the "soiling" much sooner than the darker shades. This is, I feel, a good feature, for if anything is wrong it shows so plainly that one is able to correct it at its start, whereas if it had gone on farther its checking would be more troublesome. White hogs do not like lice very well; possibly the skin is more tender than of the darker breeds. However if the breeder is not going to keep his swine free of lice, he cannot make a success of any breed.

I can truthfully say that the old bugaboo of sunburn and scab that always used to greet you when you mentioned white hogs is not worth consideration. If you want to raise hogs you must take care of them, no matter what the breed or color. Warm dry quarters in winter and shade in summer, with the proper feed and care, and the color is a thing of the least consequence. The Chesters have a number of extra good features. They attain at least as great a size as any other breed, if not the greatest, have ample bone and a frame to take care of their immense size. You can get almost any weight or size if you feed for it. An even, quiet disposition in both boars and sows. The sows are good, gentle mothers, farrow and raise large uniform litters and give ample milk for their needs. The boars are able to transmit their good qualities and stamp their individuality on even their cross offspring. The Chester breed are known as easy feeders, do equally as well under grazing or confined feeding, make economical gains, can be fattened at any age, dress nice and clean and white, as a carcass make a fine showing in either the window or on the block, and dress out a high percentage, and the quality of the meat is extra fine. There are so many good qualities that can be mentioned that the best way to find them out is to raise them.

Preserve Sows for Breeding

A SOW is a good investment. This is true even in these strenuous times of high prices of food concentrates, say specialists of the United States department of agriculture. The quotations on these feeds are controlled to a considerable extent by the price at which meat animals sell. Hence concentrates usually command a high figure when hogs on the hoof at large packing centers sell at more than 16 cents per pound. However, record prices for swine as well as feed concentrates have been a great incentive to farmers to "cash in" all the hogs available. That many sows have been included is evident from the fact that on April 1 the correspondents of the bureau of crop estimates reported approximately three per cent fewer sows on the farms in the United States than a year before. Further, this is the first year that the supply has not increased since 1913.

At this time the marketing of a sow that can be or has been bred is fairly comparable to "killing the goose that laid the golden egg." Although the fecundity of swine is well appreciated by farmers, at times sows are sacrificed when a little forethought would cause them to be retained. Breeding sows multiply five or six times as rapidly as other meat animals. They have an average litter of five or six pigs and may be bred twice a year, although three times in two years accords more with current farm practice. The litters increase in size, on the average, until sows are five or six years old. However, a large proportion of the sows are sold after producing one or two litters and before they have reached the period of greatest usefulness. Occasionally sows are unsuitable for breeding because of their clumsiness, "high" condition, inactivity or barrenness, and these, of course, go to market when of proper weight, but the total sows of this class is a mere bagatelle.

In these days when labor is high and also scarce on many farms, the hog may afford a way out. Hogs utilize refuse and waste grains, damaged grains and garbage; garnering grain behind cattle or scattered grain in harvest fields; and utilizing slaughterhouse by-products, and dairy by-products. They are also largely self-feeders. The modern farm "cafeteria" gives a pig a chance to make a hog of himself more quickly than he can by the hand-fed route, and it has the added merit of being the cheapest way of producing pork. A sow when she is not developing a litter or nurs-

ing pigs, can in summer time be placed in a pasture and given very little grain. In winter, possibly the cheapest maintenance ration is a combination of grain and hay, such as corn, wheat, rye, or barley, and alfalfa, clover, cowpeas or soy bean hay. The grain should be limited to one or two pounds per hundred pounds live weight per day. Sows should be given all the hay they will clean up. Sows which show exceptionally run down condition from suckling their pigs should be separated from the herd and fed grain until they regain breeding condition. Where pastures are very luxuriant, it is possible to carry breeding sows on pasture alone, but the most palatable hay will not keep sows in good breeding condition if fed alone.

Breeding sows are at a premium and the demand for young stock is unprecedented. The hog buyers state in their reports that they are compelled to take anything that looks like a hog. The fluctuation in the number of hogs in the United States is subject largely to the fluctuations in the financial condition of the country. The high prices paid for hogs are a big inducement to farmers to market their hogs, and as stated before, the high prices of corn caused them to cut loose during the latter part of the year. The high prices paid for hogs and an increasing export trade are the two main factors which make the hog business especially attractive at the present time. Millions of farmers would purchase sows to farrow this coming spring if they could, but this is almost an impossibility. Those farmers who are fortunate enough to have retained their breeding sows will play an important role in placing spring pigs on the market. The spring gilts from these litters should not be sent to market for meat purposes, but should be retained or sold only for breeding purposes in order to augment the pig crop next year.

Meat by the Hog Route

THE meat supply of the country can be increased more quickly by the "hog route" than by any other. The country's need to augment its supply is great but prevailing high prices alone should be sufficient inducement to farmers to raise more hogs. The prospect of success never was brighter. The high prices ruling in all markets show that the demand for pork is in excess of the supply.

No branch of live stock farming is more productive of satisfactory results than the raising of well bred swine, if conducted with a reasonable care. Hogs fit into the modern scheme of farming on nearly every farm and are one of the most important animals to raise both for meat and for money. They require less labor, less equipment, and less capital, make greater gains per hundred pounds of concentrates fed, reproduce themselves faster and in greater numbers, and give a quicker "turn-over" of money than any other animal except poultry. Farmers of the South and West particularly have awakened to the merits of the hog and are rapidly increasing their output of pork and their bank accounts.

The hog has no rival as a consumer of by-products and numerous unmarketable materials which but for him might be wasted. Kitchen refuse, not only from farms but also from hotels and restaurants, when cooked before being used makes an excellent feed.

The value of skim milk as a hog feed is known on every farm though not always fully appreciated. In the neighborhood of many large dairies pork production is a very prominent and lucrative supplement to the dairy industry.

To prevent tuberculosis all milk and milk products should be cooked before being fed to hogs. To control hog cholera use sanitary precautions and anti-hog-cholera serum treatment.

Give your hogs every chance to become meat.

The hog is also a large factor in cheapening the production of beef. Hogs are placed in the cattle feed lots to utilize the corn and other feeds the cattle have failed to digest and which otherwise would be wasted. Hogs following steers in many cases have increased the profit per steer by from six to nine dollars. Hogs should not be allowed to follow dairy cattle unless the cattle are tuberculin tested. Disease, such as cholera, has been taking a smaller toll the past season than in recent years; more purebred and high grade hogs are available than ever before; prices of hogs are now past the 16-cent level; demand for pork for home consumption and for export is keen. All of which means that the farmer who does not raise hogs is losing a chance to increase the supply of pork and thus serve the country and at the same time expand a profitable phase of farming.—U. S. Department of Agriculture.

DAIRY HEIFER DON'TS

In rearing and developing dairy heifers—

Don't overfeed. Twice as many calves are stunted by overfeeding as by underfeeding.

Don't change suddenly from whole to skimmilk.

Don't keep calves in damp, dark, crowded, poorly ventilated barns.

Don't feed milk in dirty pails.

Don't be irregular as to time of feeding, temperature or amount of milk.

Don't feed too much alfalfa hay before the calf is three months old.

Don't let calves suck each other after drinking milk. They should be placed in stanchions and fed grain.

Don't make calf go without water because it has had milk.

Don't let calf drink foaming milk just from the separator.—H. H. Kildee, University Farm, Minnesota.

TO DISPLAY TO SHEEP MEN MANY TYPES OF LAMBS

A demonstration of market lambs, planned to be of special value to every sheep man in California, is arranged as a special feature of farmers' week, to be conducted by the University of California at the university farm at Davis from May 29, to June 1. There will be a display of the leading breeds of mutton sheep, lambs of the different breeds and classes, and lambs of various kinds all made ready for market.

CHEESEMAKERS' WEEK

"Cheesemakers' Week" at the university farm at Davis occurred May 28 to June 2, at which the making was taught of "California Jack Cheese" and "California Half-Skim Jack Cheese".

Elliott-Brant Rancho Guernseys Are Persistent Producers

The results of our first two years of official testing show our herd to average 10,172.28 Pounds of Milk and 507.97 Pounds of Fat. One half of these cows were heifers with first calf who averaged 8,670.24 Pounds of Milk and 436.01 Pounds of Fat (only 7 pounds under the average of all A.R. records). Our mature cows averaged 12,710.5 Pounds of Milk and 621.52 Pounds of Fat (120 pounds over the average of the mature cows of the breed).

A bull from these cows will increase the production of almost any herd.

Elliott-Brant Rancho, - Owensmouth, Cal.

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY
YOUR COWS MADE PROMPT. REGULAR BREEDERS BY
STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. Price $1.00. Mail postpaid, in plain wrapper.

Purebred Registered

HOLSTEIN CATTLE

A Holstein owner knows that he holds as an asset something more than size, weight, individuality, breeding and the highest standard of productiveness. He knows that he is a partner, directly and indirectly, in all of the progressive efforts of the Holstein-Friesian Association, and also in its financial soundness and mighty prestige. He benefits from its annual prize offerings of $22,500, and its yearly educational publicity campaign costing $25,000. The official records of its Advanced Registry Office establish for his cows positive and relatively high market values. Since 1908 the average auction price of Holsteins has increased to $255 per head. There's big money in the big "Black and White" Holsteins.

Believes in Chester Whites

MRS. L. M. YORE of Placer County believes in the Chester Whites. She believes they are the "Aristocrats of Hogdom," and in an article in the White Breeders' Companion says:

California needs more hogs, and those of the quick-maturing type. The cry for some years past has been for "More Hogs—Better Hogs," and this is where the Chester White comes in to fill the bill.

Many are finding that California can grow corn, and corn-growing for feed on the cob, silage and fodder is fast coming into vogue. The state can grow all the feeds in abundance that the quick marketing of a hog demands. The Chester White is a good feeder, and in consequence of this can be brought into a finished condition at an early age, either as a packer's carcass, commission hog, or for the local butcher's block. For the home, he is par excellent, as the meat and lard are of the highest quality, and his hide is already white. The sausage made from the Chester White cannot be beaten as there is as distinct a delicious flavor to it, as there is to the different breeds of fowl, be they domestic or wild.

A Classy Chester White
Bonnie Belle, property of C. B. Cunningham.

In the young fruit orchard corn, dwarf milo, and sugar beets can be grown between the rows, equally beneficial to the growth of the young trees and the pocketbook of the grower, for they can be used to grow and fatten pigs at the same time, and the manure gained thereby in the meantime can be added as fertilizer. On a full-bearing fruit farm the Chester White makes wonderful gains upon the wastes, thus making his keep with the garbage from the house, and the only real cost is the grain to finish him, which is slight.

Hogs as an adjunct and side issue to the fruit farm have proven successful in a small degree with grades almost exclusively. Greater results can be attained by the use of a purebred sire of the right type, but the greatest success is assured with an entire herd of purebreds of whatever breed one prefers. I write from the basis of experience in my own county of Placer, which is great in its fruit-bearing orchards.

The Chester White is the diversified farmer's hog, thriving upon all soils and in all climates which are to be found in California, showing great prolificacy on the part of the sows of the breed, which bear large litters of husky pigs, being good mothers in the fullest sense of the term. The boars are so vigorous and prepotent that even when crossed with any other breed produce pigs that can be finished early and at any age and yield the quality of meat and lard that the market requires.

Either sex can be handled with safety by women or children because of their kindly disposition and adaptability to their surroundings. These characteristics are two prime factors in their favor, as no fat is fretted off by anger or any of the kindred emotions.

The local market of the state requires the light weight hog of the lard type for the butcher's block, and at this weight the bacon demand is met also. The Chester White again, through right feeding and breeding, meets this want, and therefore the long-bodied Chester is the best type to aim for, all other points being equalized. All the sows and boars farrowed cannot be sold for breeders, so choose this type when selecting a herd for serving the market in California.

The pig clubs are doing a glorious work. The boys and girls are proving to the older generation that hogs can be brought to a finished state in a scheduled time, and at a profit, although they buy every bit that goes to fatten the pigs in the contests, and at the high cost of feed prevailing during the past year. This campaign of education should open the eyes of the idea-bound man, who raises his pigs on pasture with very little else, and then when marketing them, their condition brings the lowest price, which also brings down the price for the other man who has fed correctly and therefore offers a better carcass.

California should and can raise all the hog meat which is needed for her home consumption, and some for export too. Combined with dairying, the Chester White can be brought into maturity or to the block stage in an incredibly short length of time and in prime condition. Alfalfa meal soaked in either buttermilk or skim-milk has been proven a growth and fat producer here on the coast, topping off with cracked corn or our staple, barley.

Efficient dairy cows must have efficient rations in order to produce a heavy flow of milk.

A Notable Sale—Proceeds to Go for Liberty Bonds

Written for California Cultivator By C. A. Briggs

TWO hundred and eighty-five head of registered Holstein-Friesian cattle, the entire dairy herd of the celebrated Stanford University Ranch at Vina, were sold at public auction on June 5, 6, 7, for a price of $57,000. Considering the fact that there was a large number of young bulls and calves, the average made was good and the University trustees are to be congratulated on the success of the sale. The bulls sold at low prices considering individuality and breeding, many of them going to head grade herds. This is very gratifying to members of the Holstein breeding fraternity as it spreads their doctrine of more and better cows and will add materially to the dairy wealth of the state.

The sale opened with addresses from H. M. Newhall, president of the board of trustees, and Vanderlynn Stow, a trustee and business manager of the board, and by M. H. Tichenor, sales manager. The first day's sale totaled $17,640 on 100 head, no large prices being obtained, but as much young stock went into the day's offering the average made was fairly satisfactory.

On the second day's sale of 100 head a total of $24,515 was secured. On this day the top notch animal was sold at a price of $1600. Mrs. H. V. Bridgford of Knightsen made the opening bid of $750. Bidding was rapid up to $1500 when Mrs. Bridgford secured the much desired animal with a final raise of $100. This splendid cow, Boweda, was born Oct. 30, 1910, and has a seven-days record of 31.91 pounds butter and 468 pounds milk, 30 days 123.55 pounds and 2180.60 pounds milk with an average per cent of fat of 4.53. She has averaged 72 pounds of milk for 30 days. She is a splendid individual and will make records in the show ring. Her sire is Sir Dorinda Jewell who has four tested daughters who have averaged 26.69 pounds of butter. Fourteen thousand eight hundred and forty-five dollars for 85 head on the third day concluded the sale.

This is the first three-day auction sale of purebred cattle in this state, and proves the enormous demand for stock of the right kind. Many buyers bought steadily from first to last. New men appeared each day and the deepest interest was manifested. Splendid cool quarters were provided by the management in open sheds carpeted with a thick covering of freshly mown alfalfa. This is an innovation and should be followed at all sales as it keeps down dust and makes the ground cool. An excellent lunch was served free to all each day and was appreciated by every one.

Geo. W. Wendt, herdsman, who knew every animal like his A B C's, was in the box and won golden opinions by his very evident honesty and desire to represent every animal as it actually was. Col. Ben Rhoades of Los Angeles and his son, Harold B. Rhoades, put the "blacks and whites" into the hands of buyers from the several states of Nevada, Oregon and Washington in record time. The Colonel sprung some "new ones."

Three students of the University of California, F. Croce, T. Krieger from the Argentine Republic and E. Susalta of Santiago, Chile, were present, the last named being a purchaser of several fine animals. The Davis farm was represented by the presence of Dean H. E. Van Norman, Prof. F. W. Woll and Prof. E. C. Voorhies. All parts of the state from Shasta to San Diego were represented, and evidence of the effective work done by Publicity Manager C. A. Farnsworth.

Among the buyers were Geo. A. Smith, Corcoran; Frank Hatch, Modesto; J. D. High, Modesto; Owen Duffy for Napa State Hospital; G. H. Upman; Mr. Atterbury, Crows Landing; Mrs. H. V. Bridgford, The Bridgford Co., Knightsen; D. A. Lindley, Sacramento; S. P. Garbutt, Princeton; M. P. Pillsbury, Chico; Baden Stock Farm, South San Francisco; Ambrose Estate, Nord; I. F. Van Lobensels, Durham; M. H. Daniels, Burlingame; C. C. Brode, Durham; Gottshall & Magruder, Ripon; M. H. Tichenor, Palo Alto; Geo. Jacobs, Gold Hill Oregon; Strang & Duel, Medford, Oregon; Kenneth Abbott, Milpitas; B. J. Bills, Orland; D. Wigit, Meridian; M. T. Machado, Gridley; Cayon & Manley; C. Surata, Santiago, Chili, South America; R. E. Field, Biggs; J. Loyer, M. H. Donaldson, Woodland; Frank Machado, Montague; W. H. Saylor, San Francisco; Jno. Nelo, Gridley; H. E. Cornwell, Modesto; C. R. Fester, Escalon; C. S. Mahle, Standish; W. D. Gore, Middleton; C. A. Kaiser, Biggs; Dr. W. Smith, Peters; M. E. Mead, Galt; W. H. Calhoun, Healdsburg; F. F. Martin, Reno, Nevada; J. Anderson, Palo Alto; H. J. Long, Mason, Nev.; Harry Smith, Chico Trinity Dredging Co.; Jas. Mills Orchard Co., Hamilton; Geo. P. Robinson, Sacramento; W. M. Newhall, San Francisco; S. M. Mealey, Gridley; Frank Helm, Fresno; C. Clark, Modesto; J. Benanti, Vina; F. R. Parker Chico; W. V. Bennett, Nord; C. A. Thayer, San Rafael.

ONION CULTURE

Continued from Page 659

over the soil and mix before planting, as they will yield potash in suitable form, this being one of the three principal chemicals required by all vegetables. A great many onions are grown from sets, and while the crop will mature earlier, the cost will be considerably greater. This condition has been specially noticeable this season of high prices, with sets now selling at 40 cents a pound.

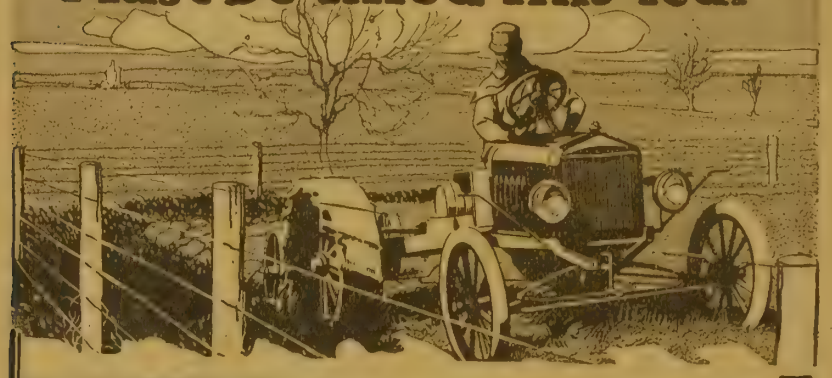
My method of culture is practically as follows. I select a certain piece of ground about this time as the location for next year's crop, cover this with several inches of stable manure, wet thoroughly for several days in succession and spade in when the earth is ready to work. Next I sow thickly buckwheat seed broadcast, the object being to increase the supply of humus which this growth will make when turned under later on. In about six weeks the buckwheat will bloom and go to seed, and after this falls it will come up again. Thus I secure a large growth from one planting of seed. By keeping the ground moist, specially during hot weather, by either sprinkling or irrigation, a heavy crop of succulent green may be secured. At the time of turning under I usually add the sweepings from my chicken yard, spreading this refuse over the buckwheat and spading it all in at one time. If this is again wet down and kept so for a short time, it should be in prime condition for planting. It should be remembered that the buckwheat will not stand very cold weather. I believe that it is necessary to turn under a large amount of green growth, as the supply of humus has to last for the seven or eight months the onions are on the land, owing to the impossibility of working the ground during that time. The loss of humus is all the more apparent on light soils, which burn out more readily. Next I sow the seeds thickly in drills, and after the shoots appear above the ground water and cultivate until the plants are the size of a lead pencil, at which time they are ready for transplanting. Cultivation after each irrigation, as well as keeping the bed free from weeds, is very essential. I now loosen the soil with trowel or fork and remove the plants, shaking off what little earth clings to the roots. Half of the roots and a third of the tops are now removed, and they are then ready to be reset. I keep the young seedlings covered with a wet sack after removal and before pruning, while I spade up the ground where they have been growing. The object in pruning the roots is to facilitate transplanting, while the trimming of the tops prevents excessive wilting. With a garden line stretched across the bed to mark the rows I reset the plants about one-half inch deep and five inches apart, making a hole with my finger and firming the soil about the roots. The rows are about 15 inches apart and on the level. If it is intended to cultivate between the rows with a horse the distance would of course have to be much greater. The bed should be thoroughly sprinkled or irrigated as soon as possible after the seedlings are set, and although some may appear to be wilted for a day or so they will come out all right. It is well to keep the ground fairly wet until the plants have taken hold.

The transplanting system is considered the best method of culture and is used by all large growers, as it frees the bed from weeds and establishes a proper distance between the plants, thus insuring a larger crop of more uniform size. According to the records of the Tennessee station a few years ago, an acre of transplanted onions yielded 823 bushels, as against 206 bushels from an acre not so treated, while the North Dakota station reported a yield four or five times greater.

When the tops begin to turn brown and wither is an indication of the ripening of the bulbs. They should then be pulled up and allowed to dry by placing several rows together. To guard against sunburn, to which the white varieties are the most susceptible, it is better to gather them into small piles, cover lightly with straw and leave for ten days or two weeks. They may be gently stirred several times during the drying process and then recovered. When thoroughly dry, the tops may be removed, and the onions stored or marketed. It should be borne in mind that the harvesting must be done in dry weather, and if the seed is sown at the right time, no difficulty will be experienced at maturity from this source. It sometimes happens that there may be at harvesting time a few plants whose tops are still green, but it has been proven that these will ripen along with the others. Should there be much rain at the time the onions are ripening, there is danger of rerooting with consequent injury to the bulbs. Properly cured onions, when poured from one box to another, should sound like blocks of wood, but care should be taken in handling the white varieties, which are very easily bruised. The white onions are tender and mild in flavor but not as good keepers as the darker kinds. The White Queen is an early onion, and for a late spring crop, the best kind is the Australian Brown, which does not grow quite so large. It has been reported that Australian Brown onions have been kept in prime condition for as long as a year under proper storage conditions.

For complete and reliable information on onion culture, address Hon. Secretary of Agriculture, Washington, D. C., asking for Farmers' Bulletins Nos. 39 and 354, which will be sent free, if copies are still available.

Every Acre-Every Fence Corner-Must Be Tilled This Year



DEALERS!

Here's a light tractor proposition that you can sell under an absolute guarantee of satisfaction to the buyer. The pioneer Ford tractor attachment of them all—a tried and **proven** success on thousands of farms—we are offering you for a short time only, the opportunity to sell TRACFORDS in **your** territory on most liberal terms.

TRACFORD agents have sold as many as 15 to 20 machines in a single demonstration—hundreds have sold out their allotment in a few days. So write or wire us for dealer information **at once!** This offer will remain open for only a short time.

Write or wire us TODAY

The food supply of the world is practically exhausted. Our success in the war is dependent upon the American farmer—and upon America's 1917 crops.

To meet the demand, every tillable acre must be put under cultivation—every small tract and fence corner must be profitably planted. The foresighted business man is planning on plowing every foot of his ground—*and plowing and planting right up to the fence line.* That is why thousands of American farmers are buying the

TRACFORD

"The Tractor Universal"

$125 F. O. B. Detroit

—the dependable and **proven** attachment for converting Fords into light farm tractors. With the TRACFORD, you can quickly turn your Ford car into a powerful tractor unit—a tractor light in weight and with a short turning radius, making it a most practical plowing machine for cultivating the open field—the small strip of land. Its short turning radius makes the TRACFORD splendidly adapted for orchard work—for working in and around—"to" and "away" from the trees

The TRACFORD is the tractor unit for **you**—for **your** work—and **your** farm.

Do You Know the Difference Between "THRIFT" And "EFFICIENCY"

In the early days we heard a great deal about "thrift", today we hear the word "efficiency" used on every hand, in the factory, on the farm, on the ranch, even in our preparation for the great war before us everyone is talking about "efficiency". What is the difference?

Webster says—"Thrift is frugality; good husbandry; economical management in regard to property." "Efficiency" is something more than this—it is, says Webster—"The act of producing effects; a causing to be or exist." In other words "thrift" is the taking care of what you have, in the best possible manner; "efficiency" is the reaching out, the increasing of output, the "causing two blades of grass to grow where but one grew before".

As applied especially to the man who is raising crops, whether the owner of a large ranch or the small truck gardener, "thrift" is getting along with the implements you have, the careful planting and weeding; "efficiency" is studying your ground, your climate, the kind of seed to plant and over and above all it is the careful regulation of the moisture in the ground. You can't depend on the rainfall for this. What is the answer? Ask the man who raises the largest and best crops and he will tell you it is "IRRIGATION". It is the ability to pour a flood of fresh, cool water on the land when it is parched, when every leaf is crying for water. To do this you need pipe and there is but one pipe today that has stood every test and that pipe is—

A TREE IN BLOOM

By William Nauns Ricks

Today I saw a tree in bloom,
And from my heart there passed the gloom,
Of earth born clouds and dull gray days,
And in their place rose songs of praise.

"The Firm Foundation" which was laid,
When men in darkness walked afraid,
And hymns of light through which I see
The now—and future hopes for me.

I saw how far its roots were spread
To serve the branches overhead,
And saw the tender feelers creep
To depths where hidden waters sleep.

I saw them touch the deepest place
Where God has planted his rich grace,
And through their winding courses bring
These living colors of the spring.

I saw a tree in bloom today
And in its presence bowed to pray,
That He would teach me how to find
The flowers of truth through ways that wind.

STRAWBERRIES—RAW AND OTHERWISE

Written for California Cultivator
By Mrs. A. Stainton, Los Angeles

NO garden can afford to be without the strawberry. Of all the fruits which can be grown in the garden, the strawberry offers greatest inducements because of ease of growing, delicious quality, long season and quick bearing. Strawberries crushed and well sugared are in a way preserved and will keep much longer than without the sugar, so that it is economy to care for them the moment they come from the market, whether they are to be eaten whole with sugar and cream or preserved. If they are spread out on plates and platters so that each stands by itself they will keep much better than when weighted down in the crowded box where one decayed berry will affect its neighbors. The acids of the strawberry are a splendid tonic for bilious people, but there are some people who cannot eat raw strawberries without experiencing great discomfort. It is claimed that if a little cayenne pepper is added to them it does not unpleasantly detract from their flavor and will help overcome difficulties in digesting them.

Of the ways of putting up strawberries perhaps the jam is the most generally acceptable but the preserve the most generally useful since it can be used for many of the things for which the fresh berry is used.

Sun Preserved Strawberries

Pound for pound is the rule, and the fruit and sugar are put together in layers. Place the dishes in the sun for two or three days, the fruit two or three inches deep and the dishes covered with window glass. This process makes the fruit plump and firm. Lift every berry carefully with a fork and put in a small tumbler. Add a pint of strained fresh juice and a pound of sugar to the liquor from the dishes, boil until the mixture jellies, pour it over the fruit and seal.

Strawberry Jelly

Wash, hull and mash the berries and drain them over night in a jelly bag. To each five pints of juice add one pint of currant juice and use a pound of sugar to each pint of juice. Bring the juice quickly to a boil, boil, for 15 minutes, add the sugar, stir until the sugar is dissolved, boil for five minutes. Put a little in a saucer and stand on ice. If it forms a jelly-like crust it is done. If not, boil longer. When done put into glasses, cool and cover.

Strawberry Pie

Two boxes strawberries crushed slightly, add one cup sugar and stiffly beaten whites of three eggs. Turn in crust that has been baked and brown in oven.

Scalloped Strawberries

Two boxes strawberries and a pint of cream are required. Whip the cream, wash and hull the berries, place a layer of the fruit in a deep glass dish, add a sprinkling of powdered sugar and cover with the whipped cream. Continue thus to make layers until all are used, heaping cream on top. Set on ice to chill thoroughly.

Strawberries English Way

Arrange with hulls on around a little pyramid of powdered sugar in individual dessert plates. To eat, pick them up by the stem, dip them in the sugar and bite off the berry.

Iced Strawberries

Add a cup of sugar to stiffly beaten white of one egg. Fold hulls of berries close to the stems, dip in icing and dry on a platter.

Strawberry Ice Cream

Mash two boxes of berries, add a cup of sugar and stand aside for an hour. Scald a pint of cream, add a cup of sugar, stir till sugar is dissolved and cool quickly. When cold add another pint of uncooked cream and freeze. Stir the berries until the sugar is dissolved and add them to the frozen cream. Put on the freezer lid and turn slowly till mixture is quite hard. Repack, cover and stand aside for two hours or longer. Serve with hot chocolate sauce.

Strawberry Dumplings

Biscuit dough cut into rounds about four inches in diameter. Put two berries into each round, pick up the dough and roll the dumpling in the hand until you cannot see an opening. Place them in a greased baking dish. Brush them with milk, dust with granulated sugar and bake in quick oven. Serve with a pitcher of thick cream and dish of crushed and sweetened berries or strawberry butter.

Strawberry Shortcake

Bake ordinary layer cake in shallow pan and when cold cut into squares. Whip a pint of cream. Put a square of the cake in the serving plate, cover with a generous layer of cream, fill thickly with berries, and dust with powdered sugar. Another layer of cake, cream and berries and the cake is complete. Serve with cocoanut cream or a boiled custard.

Strawberry Cocktails

Slice large ripe berries, cover with orange juice and stand on ice. Serve in stem glasses. Add a teaspoon of sugar and a little shaved ice to each portion.

Strawberry Griddle Cakes

One box strawberries, 1½ pints flour, one teaspoon salt, one tablespoon brown sugar, two teaspoons baking powder, two eggs and one pint of milk. Sift together flour, salt, sugar and baking powder. Add beaten eggs, milk and berries and mix into a batter. Have the griddle hot enough to form a crust as soon as batter touches it in order to confine juice of berries. Turn quickly in order to form a crust on under side. Turn once more on each side to complete baking.

WORTH TRYING

The small boy stood at the garden gate and howled and howled and howled.

A passing old lady paused beside him.

"What's the matter, little man?" she asked in a kindly voice.

"O-o-oh!" wailed the youngster. "Pa and ma won't take me to the pictures tonight!"

"But don't make such a noise!" said the dame admonishingly. "Do they ever take you when you cry like that?"

"S-sometimes they do, an'—an' sometimes they d-don't!" bellowed the boy. "But it ain't no trouble to yell!"—Answers.

OF COURSE NOT

As a train was getting up steam to leave a certain station it suddenly parted in the middle. Of course, the communication cord broke, and one end of it struck an old woman, who was standing on the platform, in the face.

"Goodness me!" she gasped in astonishment. "What was that?"

"The train has broken in two, madam," said a man who stood near her.

"And I should think so!" said the old woman, indignantly, as she eyed the broken cord. "Did you really think that a piece of string like that could hold a train together?"—Answers.

The Cultivator Patterns

8385—Ladies' Blouse. Cut in sizes 36 to 42 inches bust measure. The blouse is to be slipped on over the head.

HOUSEHOLD QUERIES

Caper Sauce

Kindly advise through the columns of your paper method of preparing caper sauce.—Subscriber, Acampo.

Pack the flower buds in bottles and cover with vinegar. They are used as flavoring for sauces and vinegar.

Hominy

Please give recipe for making hominy. I have difficulty in getting mine to peel properly.—Subscriber, Strathmore.

Recipes for making hominy were given in the Cultivator of December 30, 1916. By referring to your file of Cultivators a satisfactory recipe will be found. Copy is mailed to inquirer.

Tomato Paste

What is tomato paste? I see frequent references to it's being imported from Italy and would like to know how it can be made.—Subscriber, Los Angeles.

To make tomato paste put ripe, sound tomatoes in an earthen or agate kettle, and cook slowly until skin cracks and peels off. Then put in a hair sieve over a large bowl; the first very thin liquid that runs from them should be thrown away. Press juice and pulp through sieve, and put in preserving kettle; to each pound of fruit add one teaspoon of mixed spices; and salt.

Use only a little salt as the fruit is boiled down considerably and it is apt to be too salty. If needed, more salt can be added after it is cooked thick. Cook slowly until it is quite thick, then put in wide-mouthed bottles. Stand the bottles in a kettle containing water enough to come half way up their sides, and boil as you would canned fruit; then remove from kettle, let cool and seal, using paraffin over the corks. Less spice may be used if liked. Some cooks use a little onion or garlic and bay leaf as flavoring. This paste, being concentrated, is very convenient to use in cooking, and it may be kept in any wide-mouthed bottles one has.

AN APPRECIATION

"A Subscriber, Riverside," has read with much interest economies practiced by the thrifty housewives who are readers of this paper. Most of those mentioned in these articles have been in practice in my home for years. Were all the housewives of this country as thrifty as these, Herbert Hoover would have to change his business.

Preserving Citron

Please tell me how to preserve citron.—Subscriber, Goleta.

Complete directions are given in article on Page 660 of this issue.

Irish potatoes and most other vegetables and fruits tend to make the body tissues and fluids alkaline, so correcting the tendency of meat, eggs, fish, and similar foods to create acid conditions. Since the body performs its work best when it is neutral or slightly alkaline, this function of fruits and vegetables is important, especially to the hearty meat eater.

It isn't "shiftless" to have a magazine or paper in the kitchen to read while doing some kinds of work. Many bits of news or good articles may be gotten hold of in odd moments when only one hand and really no eyes are required for some task, or while waiting for something to boil or brown when you do not quite dare leave it and go to some other part of the house.

Coulter's

Dual Removal and June Sale

A sale in which is offered ONLY dependable, first-class merchandise from our own high grade, carefully selected stocks of dry goods.

160 ACRE FARMS IN WESTERN CANADA FREE

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat at over $2 per bu. offers great profits to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops

You Can get a Homestead of 160 acres FREE

and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of Oats, Barley and Flax.

Mixed Farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

There is now an extra demand for farm laborers to replace the many young men who have volunteered for service in war. The government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

Blackhead, the Scourge of Turkeydom

Written for California Cultivator By Jean A. Koethen

NINETY-FIVE per cent of all the young turkeys that die, die of blackhead. This statement is made by the Rhode Island experiment station, our leading authority on this disease, and cannot be disregarded. We used to attribute these numerous and tragic deaths to a mysterious kind of "liver trouble," but it is absolutely clear that "liver trouble" is blackhead and nothing else. When a young turkey begins to mope, stands by itself or lags behind the others, eats little or nothing, seems thin and weak and just generally "played out," we may as well say "blackhead" first as last. There is almost always diarrhoea, sometimes more, sometimes less. In poults over two months old this symptom is more pronounced than in younger birds, and if it can be controlled the bird may be saved, but that rarely happens. Once attacked by blackhead a poult is as good as dead.

The term "blackhead" is itself a misnomer. Most poults' head do not turn black. They are sometimes pale, sometimes dark. In birds that have "shot the red" the change of color is more noticeable than in younger ones. The disease is most common in poults from six or seven weeks to three months of age, but is often seen in half grown birds. A turkey of this age does not droop as suddenly or die as quickly as a younger one would, but may be seen day by day getting a little thinner, a little paler about the head, eating at times and then again standing back while the rest eat. Finally it becomes so weak that the others pick on it, and then death speedily ensues.

I said we might as well conclude, when such symptoms appear, that the disease is blackhead, but the fact is that while these symptoms are characteristic of blackhead one cannot be absolutely certain of his diagnosis without a post mortem examination of the liver and ceca or "blind pouches" of the intestine.

Post mortem examinations by the unskilled seldom give much light on the cause of death, but in the case of turkeys it is worth while to cut a dead bird open in order to be entirely satisfied. Deprived of technical phraseology it may be said that spots of any sort on the liver of the dead bird or an unnatural condition of the little "blind pouches" indicate blackhead and nothing else. Drooping wings and loss of appetite might result from infestation by lice and mites; the spotted liver means but one thing.

Now, this unhygienic condition of the intestinal tract comes from overfeeding. In birds that are fed as they should be the intestinal tract is clean and healthy. Overfeeding brings on indigestion, and indigestion produces inflammation. The parasites develop in the inflamed membranes, and the condition described above ensues.

Once satisfied that blackhead is present in the flock, what are we to do about it? There is but one answer, "Get rid of the cause." This will not save the sick turkeys, but it may save the rest of the flock. In a previous article I outlined the Rhode Island method of feeding young turkeys. So far this is the best answer to the question, but it may be that next year there will be a better one. Let us keep very clearly in mind the fact that blackhead is the result of captivity in birds that have not become thoroughly domesticated. This is the key to the solution of the problem. The nearer we can approach, in our method of caring for turkeys, their natural environment and diet, the better is our chance of success. The wild bird eats bugs and seeds, nibbles at weeds and grasses, and is at it all day. Whether we have in Southern California any range that contains sufficient animal food to make artificial feeding unnecessary, is a question that has not been answered. Probably a big alfalfa ranch most nearly fills these conditions. I have been told that on the alfalfa fields of Imperial Valley the turkeys "grow like pigs." If this is true the solution of the blackhead problem is in sight. But the difficulty we still have to contend with is the diet of young turkeys the first few weeks before they are able to forage for their food.

SAVE THE FLOCKS

Poultrymen of Southern California are meeting this week and discussing with Prof. Dougherty of the state university practical poultry keeping. Next week, June 19, 20 and 21, meetings will be held in the high school auditorium of Pomona. At that time there will be discussions on housing and yarding, feeding, vital facts in incubating, successful brooding, principles of breeding, selecting and culling.

It is a time when poultry people should consider every possible economy and every possible means leading toward greater efficiency, for only by best of management can poultry or eggs be produced with feed at present prices. Some are discouraged and will doubtless quit the game. But with the world crying for food the poultry people should not fail to keep their end up and produce more and better. Cornele G. Ross of the Pomona committee urges the attendance of every poultryman of Southern California and suggests that everyone should bring notebook and pencil and make record of the many valuable points which will surely be brought out in the discussion at the Pomona meeting.

The luncheon and afternoon sessions of the third day will be held in Ganesha Park. The Pomona committee is providing coffee and will furnish tables and chairs. Ganesha is one of the most beautiful little parks in all California and the noonday luncheon by the running brook will be a most pleasurable event.

PROTECT SITTING HENS FROM MITES AND LICE

Great care should be taken to keep nests occupied by sitting hens free from mites. It is hard to work effectively against the mites when many hens are brooding. Oil in the form of crude petroleum sprays—the treatment recommended by specialists in the United States department of agriculture—used freely about the house at that time, may soil the eggs and prevent successful hatching. Infested quarters, therefore, should be treated thoroughly before hens are set, so as to start them in nests which are absolutely clean. Beneath the straw of the nest a layer of lime and sulphur will tend to prevent mite breeding, and the entire nest may be dusted occasionally with pyrethrum. Broken eggs and the straw soiled by them should be removed promptly, as they tend to attract mites.

Medicated nest eggs, said to control poultry lice, are on the market. These consist largely of napthalene. While this material will destroy lice when applied generally to the fowl, it is injurious to the hen's eggs as well as to the bird. If used in quantity, or if the medicated eggs are allowed to remain for some time beneath a hen, she may die as a result. Sodium fluorid powder, dusted on the fowl, or dissolved in water and used as a dip, is the best remedy for lice.

HAY

Under date of June 9 Scott, Magner & Miller say:

Arrivals past week 828 tons. Consignments have consisted of old crop as none of the new is yet moving into our markets. The demand has been remarkably light in this city and Oakland. Harvesting is in full operation and in some sections hay is baled and ready for market. Alfalfa continues to be in good demand. There is no second cutting in the market as yet. There has been no straw arriving and probably will not be until later on when new straw is ready to bale. We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market. For prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.

Wheat, Fy., lt. bales.....29.00@30.00

Citrus Fruit Market

LOS ANGELES, June 13, 1917.

The naval season closes with long prices and keen demand is cleaning up all of the seedlings, sweets and other end-of-season offerings. There are still going forward 125 to almost 300 cars daily. The outlook for Valencias indicates exceptionally long prices the season through.

Lemons are now coming more freely from Mediterranean sections and the cool weather generally prevalent prevents prices usually obtained at this season.

Shipments

Shipments of oranges from Southern California since November 1, 1916, 28,740 cars, lemons 5083, total 33,823; to same date last season, oranges 23,283, lemons 4264, total 27,647. From Central California to date this season, oranges 4273, lemons 154, total 4427; to same date last year, oranges 5386, lemons 146, total 5532. From Northern California to date this season, oranges 845 cars; to same date last season, oranges 619, lemons 1.

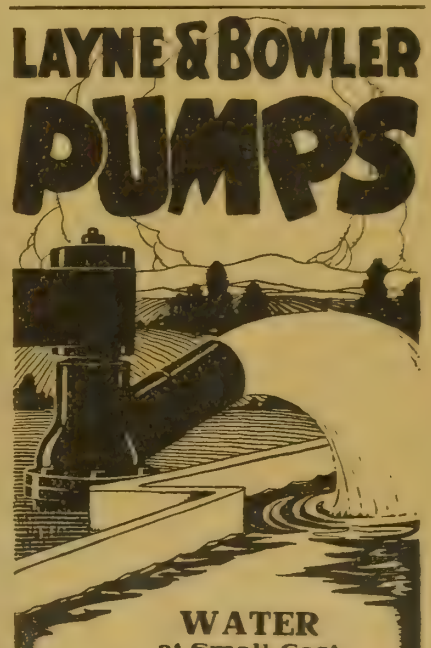
not disturb it. A physic of oil and aloin would probably be good for her. Try this: aloin one ounce, turpentine four ounces, powdered nux vomica one ounce and raw linseed oil enough to make two quarts. Mix and divide into four doses. Give one dose every other day. See that she has plenty of good water to drink and feed green stuff to keep the bowels loose.

Cankered Ear

Please tell me what to do for my dog eight months old. He has a running discharge from one ear that is very offensive, and he is constantly shaking the head as though it caused him pain.—Subscriber.

It may be canker which is due to a germ or it may be caused by ticks getting into the ear. Either is hard to cure but the only remedy that seems to do them any good is a few drops of kerosene in the ear once a day. Be sure it goes right into the tube that leads into the head. It will do no harm in either case.



LAYNE & BOWLER PUMPS

WATER at Small Cost

When one considers the greatly increased profits and successful crops absolutely assured year in and year out, because of being able to depend upon a reliable pumping plant, the cost of installing such a system is very trivial. With the introduction of

LAYNE & BOWLER PUMPS

which were perfected after years of experimenting and the expenditure of thousands of dollars, all the exasperating pumping troubles of the past disappeared.

CALIFORNIA CULTIVATOR

THE LIVESTOCK and DAIRY JOURNAL Combined with CALIFORNIA CULTIVATOR

LOS ANGELES June 23, 1917 SAN FRANCISCO

We are going to GIVE AWAY

Home Steam Canners

Get one for yourself—the plan and work is easy and you can save $100 or more on your grocery bill.

California Cultivator is going to give away **Economy Home Canners,** one of the handiest, most economical and successful Home Steam Canning devices ever made. Anyone accustomed to cooking can put up fruit and vegetables rapidly and successfully with the Economy Home Steam Canner. Directions as to how long to steam and otherwise handle fruits and vegetables are sent with each canner. The work is easy and to secure one will only take a few minutes' effort among some of your friends.

Get a Canner Like This and Save Money on Your Grocery Bill.

The Economy Home Canner and Cooker is a scientifically made canning vat 24 inches long, 10 inches deep and 12 inches wide with steam tight cover made to hold 16 quart jars at a filling. It has two bottoms, one inside the other. The inside one is so made that the fruit jars set on it above one gallon of water. It is perforated.

This arrangement necessitates only a small amount of water and therefore minimum fire. The top or lid closes down inside a steam tight suction slot, making it possible with the canner and cooker to retain great steam heat, thoroughly cooking and sterilizing whatever is inside. Directions for putting up fruits and vegetables and how to get best results from using the Economy Home Canner and Cooker will be sent with each order filled. Any housewife accustomed to cooking can operate one of these canners successfully. It is quite possible for one person to can from 50 to 75 quarts of fruit or vegetables in one day after the fruit is prepared. When not in use as a canner it can be used as a steam cooker and it makes a valuable bread or cake box, lunch or picnic kit.

Owing to the high prices of canned foods and the shortage of tin cans, it behooves every housewife to put up as much foodstuffs as possible from California's great crops. If this is not done by individuals everywhere, rich and poor alike, hundreds of tons of foodstuffs will go to waste in California soon, when, a little later, high prices will be paid for similar eatables that are canned and when thousands of p e o p l e throughout the world are going hungry, some actually starving.

Pitch in and help conserve the Nation's food supply.

Here is our proposition to you—If you will send us only 10 yearly subscriptions (at least five of which are new ones), to California Cultivator at $1.00 each, or 5 for 2 years at $2.00 each (of which 3 are new), total $10.00 in subscriptions, we will send you one of these Economy Home Canners prepaid to your address. Part may be one-year and part two-year subscriptions, just so the amount is $10.00.

You can get these subscriptions in a few minutes to such a well known reliable paper as California Cultivator. Some find it a good plan to go in with four others, each paying $2.00 for a subscription and then the club owns the canner. They then get together, going from home to home, putting up each others' fruits or vegetables. This affords recreation and enjoyment and gets the work done. You won't know how easy it is until you try. You can soon get a club of 5 or 10 subscriptions.

OUR GUARANTEE—Anyone accepting this offer who is not entirely pleased with the canner may return it at once in good condition and the entire amount sent will be refunded. Some who have these canners say they have saved $100 on their year's grocery bill and wouldn't take $25 for their canner if they couldn't get another.

Packers and Hog Producers Get Together

We Give Below from the Address of Mr. F. L. Washburn of the Western Meat Company, Made at the Last California Swine Breeders' Meeting, the Packers' Side of California Produced Meats. On the Quality of This Home Produced Meat a Great Concern Proposes to Make its Reputation for High Class Products

AT YOUR last meeting in Los Angeles, the subject assigned to us related to the comparative market prices of hogs at eastern points and in California, and no doubt you will be more interested in comments coming from us on market conditions and prospects than in anything else in connection with the production end of the business, which is yours and not ours.

The unprecedented advance in live hog values has been fully justified by the high prices of grain, the high cost of labor, etc., which, in turn, have justified high values of the most extensively used hog products, viz: hams, bacon and lard.

During the period of the advance, buying has been very heavy, both on the part of dealers and consumers. Apparently the wave of domestic buying seems to have run its course to some extent, and on the Pacific Coast it would not be at all surprising to see something in the way of a reaction set in, as the high prices seem to be lessening the volume of consumption.

In fact, the Chicago market of last Monday (this address was made before the Swine Breeders' Association on May 30) showed considerable decline, the average cost at Chicago being 15.35, with Missouri River markets on a proportionately low basis. The Western Meat Company is now paying 15½ cents at South San Francisco for hogs of 150 to 300 pounds range, with a premium of 15 cents per cwt. on the live weight for each one per cent of yield in excess of 77 per cent. However, we regret to say that the premiums we have paid, especially during the last 60 days, have been few and far between.

One of the discouraging features of the last few months has been the comparatively heavy movement out of California of small unfinished hogs and of surplus breeding stock to northern and eastern points.

These hogs, I dare say, have been purchased at anywhere from 8 cents to 10 cents per pound at California valley points, and those fortunate enough to be able to put these hogs into marketable condition will, without doubt, be amply rewarded; for the corn that will be fed to these hogs in the East is the highest priced corn on record and will cost more than barley in California. The exceedingly high price of grain, to say nothing at all of an acute scarcity, is doubtless responsible for this exodus of hogs out of California; but now that the price of barley has shown a decline, and the new California barley crop is about to become available, it would seem that our hog owners should do everything possible to keep their young stock as well as their brood sows within the state of California, as the gains from two cent barley, with the proper supplementary feeds, can hardly help but be profitable, especially on account of the wide difference in the prices per pound of light weight stock and of the well finished hog of good weight, viz: 175 to 300 pounds.

We therefore strongly recommend that all hog raisers who intend feeding stock for the market provide themselves with sufficient feed to really put a good finish on the stock which they expect to sell.

It has been said that there is no inducement to turn out good hogs in California, as the packers pay just as much for the poor hogs as they pay for the good ones. As far as the Western Meat Company is concerned, we believe that our premium system should largely overcome this objection, and most assuredly so in all cases where we can come into direct touch with the producer.

Perhaps some of you have seen the advertising copy which our company has been running, in which we openly state that our best grade of hams and bacon, the Mayrose brand, is produced from specially selected hogs, which are grown and finished in California.

Our general sales manager says that it took a lot of courage on our part to go before the public and frankly tell them that the grade of our hams and bacon which we had decided to make our top grade, is selected from choice California-grown and fed hogs, instead of from eastern hogs. It did indeed take courage to do this; but we had a lot of a certain kind of courage, and we still have it, viz: the courage of our firm conviction, that the California grain-fed hog makes every bit as good pork as his Eastern corn-fed brother.

Continued on Page 689

For years California breeders have been saying to packing house people, "Pay us the price of grain-hardened hogs and we will produce the hogs." In turn the packers have appealed to the producers to produce the hogs in quantity and they would pay the price. At the Los Angeles convention of the California Swine Breeders' Association a committee was appointed to see if a working basis could not be devised which would give to California producers the same treatment which Eastern producers get in the large centers. The committee was greeted most cordially by a like committee from the packers, and it was felt that a common ground had been found on which both could stand, and one which would be just to the producers. This has resulted unsatisfactorily to some producers, however there are many cases where a difference is made and the producer receives liberal treatment. As one friend of the buyers has suggested to us: "We must bear in mind that salesmanship and desire to buy at best possible figures are factors to be considered in all these details." We do believe there should be more encouragement given to the producer, especially at this time when the world needs his greatest effort.

We are glad to give from the packer's side an address by Mr. F. L. Washburn of the Western Meat Company, San Francisco, before the California Swine Breeders in convention at Davis. We violate one of our rules and admit into this article more or less of advertising, that is, the brand which Mr. Washburn's company has chosen is often referred to. We are induced to do this because of one feature referred to Mr. Washburn, his advertising of bacon and other products as only from California-produced hogs. The packers have insisted that these hogs have been spoken against so often that there is a deep seated prejudice in the minds of the consuming public. Mr. Washburn and his company propose to remove that prejudice and are adopting as their slogan "California Produced Ham and Bacon." Success to them in this, and we hope the producer will heed the appeal and give to the packer sufficient stock—grain hardened, high class products—to enable Pacific Coast packers to show Pacific Coast consumers that the Coast can produce the equal of any section in the world. This has been proved many times in respect to beef. The recent experiment of the University of California at the International Live Stock Exposition turned the eyes of the world to California possibilities. Now let our hog men and packers unite in extending this reputation.

Farm Crop Census in Arizona

M. E. Bemis Writes for Cultivator Readers of Crops and Bureau Activities and of the Work Being Done in Arizona

TAKING an agricultural survey of a farming section of approximately 300,000 acres of highly productive land, within less than a week's time is no small job, but with team work and the right sort of boosting a good deal may be accomplished.

It has been apparent for some time that the labor shortage in the Salt River Valley of Arizona would be a serious matter this year. Last season there was a lack of farm laborers which undoubtedly caused many fields of alfalfa to be pastured which would otherwise have been made into hay, and this shortage of labor was a serious factor which prevented the planting of a large crop of grain sorghums and corn last season. This season there is at least 40,000 acres of long staple Egyptian cotton as compared with less than 10,000 acres last season, and as this is a crop which requires a great amount of hand labor from planting to harvest it was evident that with the increasing scarcity of help throughout the country there would be a greater scarcity of labor this season. The Salt River Valley Egyptian Cotton Growers' Association has advertised considerably for laborers, and a considerable number have come, but there was an increasing uneasiness among the farmers over the situation, and more particularly as there was little certainty of the actual labor needs.

That the true situation might be presented to the state council of defense with a view to bringing in laborers from other sections of the country, at the time when labor would be most needed, it was necessary to make a quick survey.

To accomplish this as rapidly as possible the state council of defense, the county agricultural agent, and the farm bureau of the Phoenix chamber of commerce worked together to hold school house rallies at the school houses of the 26 school districts of the valley on the evening of May 30.

Blank forms were prepared showing not only the labor needs, but also the crops which are growing and the summer crops to be planted, the amount of seed, additional capital and machinery which would be needed to grow summer crops on the grain land.

Community leaders were appointed in each district where meetings were to be held to look after the meetings and to assist in getting the farmers to turn out. Speakers were chosen and sent to each meeting. Previous to the date of the meetings the speakers met several times for a dress rehearsal in order that the talks might be uniform with regard to presenting the seriousness of the food and crop shortage and the necessity of doing all that is possible to increase the crops, and also to impress the importance of obtaining the labor and other needs of the farmers before it would be possible to extend to them that help which it was apparent they would need, though no one could say to what extent.

Through the press and by notices sent by mail a great deal of publicity was given, and at nearly all meetings a larger attendance was reported than was expected. In some cases where the work could not be completed at the meeting local committees were appointed to collect the data and send in the blanks.

The mass of information collected and which is now nearly compiled will prove of more value than any one dared to hope. The labor chart shows the labor needs for each community and the number of men needed at different periods throughout the year, and there will also be available considerable data relating to the wages paid by different farmers and the number of hours that laborers work in the field.

The blanks show too that there is a considerable amount of grain land which for lack of labor, machinery, teams or money the owners cannot put into a summer crop. It is also shown that there are a considerable number of farmers who have some time and the necessary teams and tools, but no surplus land for a summer crop, who would be glad to plant one if the land is availible. To bring these people together, the man with more land than he can use, and the man who would use land if he could get it, will result in increasing the summer crop acreage by several thousand acres.

Supplementing this crop survey there is being prepared a map showing in colors the different crops now growing, their location and the acreage.

The men who sold you your fruit trees say:

"Your trees must be planted *right* if they are to thrive. Make the holes deep and wide and break up the subsoil. The best way to do this is by blasting."

Nearly every Western nurseryman uses and recommends blasting for tree-planting. "We know the value of such work," say Fancher Creek Nurseries, California. "We favor blasting," says Oregon Nursery Co. "Blasting is important," says Puyallup Nursery, Washington.

Blast with

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

—which do their work cheaper and *better* than ordinary dynamites. These improved explosives—made in two brands, Eureka Stumping Powder and Giant Stumping Powder—are prepared especially for Pacific Coast *farm and orchard* work. They pulverize the soil several feet deep and wide, and place it in the best condition to insure the rapid growth of trees and crops.

Be careful to get the genuine, made by the company which originated all "giant powders." If your dealer has only ordinary dynamites, write us and we will see that you are supplied with the *real* Giant Powders.

Get Some of These Five Free Farm Books Get our valuable, illustrated books. They tell how to save money by using Giant Powders for Boulder Blasting, Stump Blasting and Ditching, how to grow bigger farm crops by blasting the subsoil and how to blast in new or old orchards. Mark in coupon the subjects that interest you, and the books will be sent free.

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

Claremont Pomological

Written for California Cultivator

THE Claremont Pomological Club will hold its closing session for the year at Ganesha Park, Pomona, all day on June 30.

This is, we believe, the oldest farmers' club in the state and, we are safe in adding, the livest. It began exerting its influence years ago in the shaping of fertilizer legislation in this state and had a hand in the encouraging of many other legislative enactments which have been beneficial to agriculture. At the coming meeting there will be no effort at influencing legislation, but there will be discussion of legislation which has been enacted during the last session of the state legislature.

To that end Senators Joseph A. Rominger of Long Beach and E. R. Shepherd of Whittier will both be present and enter into the discussion. Ex-senator Cogswell will also make an address. He will touch upon the market question which presented such an acute situation during the recent session, that is, he will discuss to an extent at least Weinstock versus Brown, or the reverse—we are not certain which, and we do not think anybody else is as to which has the precedence.

Dr. H. J. Webber of the citrus station at Riverside will make an address on the problems of citrus culture. W. M. Mertz, also of the citrus experiment station, will talk on fertilizers, a vital question when fertilizers are selling at war prices.

Perhaps one of the most important features of the session will be a general discussion of the mealy bug situation. It is hoped that State Horticultural Commissioner Hecke will be present. If not, he will be represented by Deputy Commissioner Hoyt who is located in Los Angeles. This discussion will have somewhat to do with the expert having charge of the Southern California Insectary which is now being erected at Alhambra. Many of the citrus growers are hoping that Prof. Claussen of the United States department of agriculture may be secured to take charge of this station. Prof. Claussen has been making citrus and other mealy bugs his study for many years, and the mealy bug question in California is becoming a most perplexing one. The true citrus mealy bug was thought to offer sufficient problems to give plenty of exercise for the energy of citrus growers and citrus investigators. Now comes a mealy bug infesting some of the orchards in more inland sections, which is being studied, but as yet no particular determinations have been made.

All these matters will be discussed at Pomona. The program is so complete and the events so important that an entire day is to be given to these discussions. The forenoon session begins at 10 o'clock, luncheon at noon, addresses continuing in the afternoon. The committee in charge announces that some of the best speakers are scheduled for the forenoon session.

Stop Food Waste by Drying

THE fact that every important country of the world is facing an extremely serious shortage of food materials and that it is the peculiar task of the United States to meet the need by increasing her production of the great food crops is now recognized by every one. We are somewhat slower to realize the equally evident fact that increased production is no more important than the conservation of every pound of material which is produced. Upon this point Secretary of Agriculture D. F. Houston has said:

"Both for economical and patriotic reasons the American farmer should strive this year for the highest standard of efficiency in the production and conservation of food. But production accomplished by wasteful methods does not make for efficiency, and careful thought, therefore, should be given to the steps that need to be taken.... Some of the most conspicuous crop wastes occur with fruits and vegetables, of which in normal years larger quantities usually are grown than the producers can market profitably. Frequently these losses are due indirectly to disease and insect injury which lowers their market value without reducing their food value materially if they can be utilized promptly by drying, canning, or other preservative methods. Under existing conditions every practical step should be taken to protect these crops throughout the season and to utilize and preserve them as fully as possible when they have matured. To the extent that competent labor is available, either hired or in the family, fruits and vegetables which it is ordinarily inadvisable to attempt to conserve should be systematically saved for use by canning, drying, or preserving. . . . Because of the scarcity of tin plate and the high prices of tin cans, it may be necessary in household preservation of food, more extensively to pack fruit and vegetables in other containers. This situation may call for new methods of preserving or the improvement and extended use of old processes such as drying."

It is certain that the use of transportation facilities for other necessary purposes will make it impossible to market the usual volume of the higher grades of fruit and that the growers are therefore facing enormous losses unless other means for utilizing the material are provided. It is equally certain that the small number of canneries cannot handle any materially increased volume of these products, for the reason that the cost of containers will be prohibitive even if they are not actually unobtainable. The only practical method of meeting the situation is by providing means for drying the surplus and unmarketable material, both in the commercial orchards and in the small orchard and berry patch of the farm home.

The Washington experiment station has in press two bulletins by Dr. J. S. Caldwell on methods and equipment for the drying of fruits and vegetables. One of these publications, Popular Bulletin 112, is intended for the use of the non-commercial fruit grower whose orchard and garden produce an amount of fruit and vegetables in excess of the family needs. It gives directions for sun-drying, either in the open air or in a solar drier which hastens drying while pro-

tecting the fruit from dust and insects, tells how to build a cook stove evaporator with a capacity of 100 pounds of apples, berries, or other material at a time, out of a goods-box; and gives full directions, with illustrations and bills of material for the construction of two larger portable driers, with capacities of 300 to 2000 pounds of fruit at a time, to be set up over a stove or furnace in the orchard. All these driers are simple non-patented machines which can be built from the directions and figures given by any one who can use ordinary tools, from rough lumber and at a very trifling cost. Directions for the preparation of fruits and vegetables for drying, for the operation of the various driers, and for after-care of the various dried products are given.

The second bulletin describes the construction, equipment and operation of larger commercial plants with capacities of five to 20 tons of raw material per day.

It may be pointed out that blackberries, loganberries, raspberries, cherries, currants, peaches, apricots, apples, plums and prunes, potatoes, carrots, beets, parsnips, cabbage, rhubarb, lettuce, pumpkin, green corn, peas, or beans, and other vegetables and fruits if desired can be dried upon any one of the driers described in these publications. Materials so dried have one-sixth to one-eighth of the weight of the fresh material, retain all its food value, are equally palatable if properly prepared for the table, and are in strong demand for transportation to foreign countries or as supplies for our own army and navy. There will consequently be no difficulty in finding a ready market for every pound of properly dried fruits and vegetables which the state can produce.

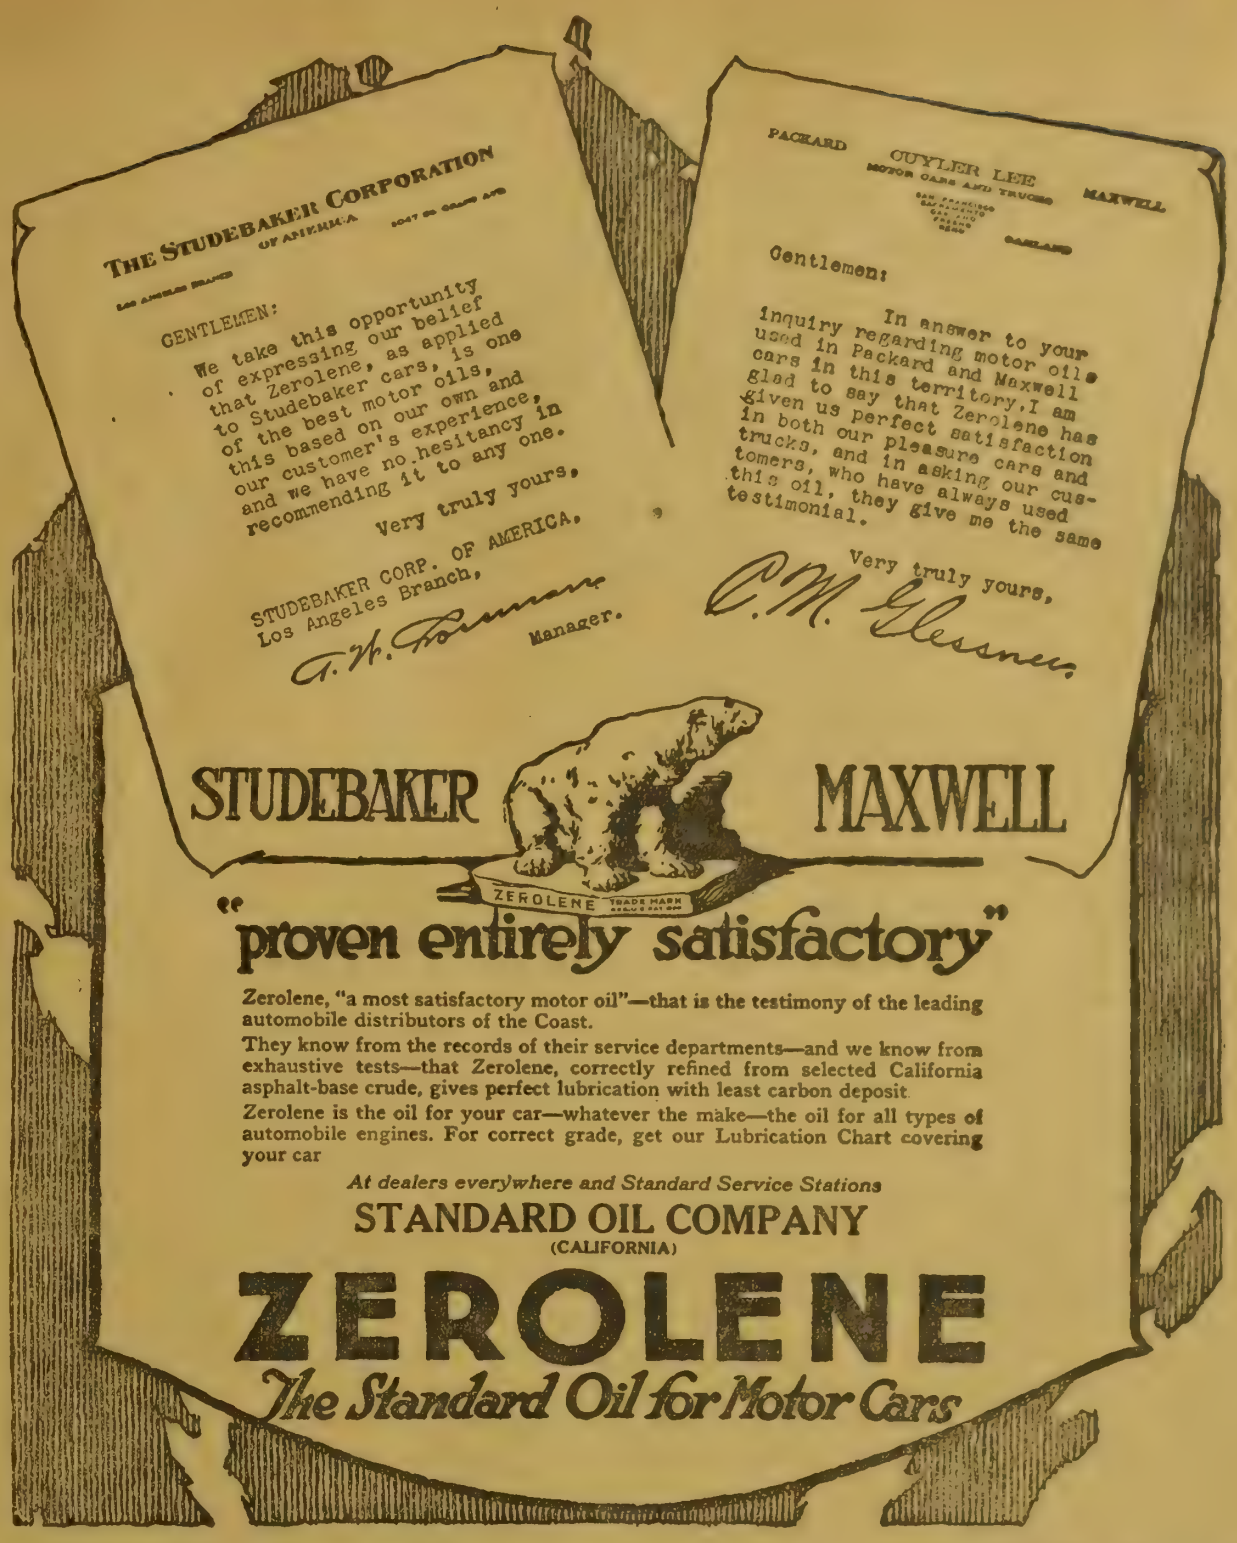
We are not certain, but think if request for Bulletin 112, with postage, is sent to State Experiment Station, Pullman, Washington, that California requests will be honored.

FRUIT JUICES FOR JELLY MAKING KEPT WITHOUT SUGAR

Fruit juices for use later in jelly making can be sterilized and bottled without sugar and made into jellies at the housewife's convenience. This enables her to do with fewer jelly glasses and to distribute her purchases of sugar for jelly making through the year. Moreover, with the bottled juice she can make a greater variety of jellies, as juices which will not jelly can be put up when the fruit is ripe and combined later with fruits that will, or fruit ripening at different seasons can be combined. For example, the juice of strawberries, cherries, or pineapple can be kept without sugar and later when apples are plentiful can be made into combination jelly.

To put up unsugared fruit juices for jelly making, proceed exactly as if jelly were to be made at the time. Cook the fruit until they are soft and strain out the juice through a flannel bag. Heat and pour while hot into bottles previously scalded. Fill the bottles full, leaving no air space between juice and cork or seal. Place the filled sealed bottles on their sides in water near the boiling point, and keep them in the bath for about 30 minutes. Make sure that the corked or sealed end is under the hot water. As soon as the bottles are cool, cover the cork with a paraffin seal. Thorough sterilization and sealing are absolutely essential to success.

To make jelly from the sterilized juice, test its jellying quality, add the proper amount of sugar, and proceed as in making jelly from freshly expressed juice.



THE STUDEBAKER CORPORATION
GENTLEMEN:
We take this opportunity of expressing our belief that Zerolene, as applied to Studebaker cars, is one of the best motor oils, this based on our own and our customer's experience, and we have no hesitancy in recommending it to any one.
Very truly yours,
STUDEBAKER CORP. OF AMERICA,
Los Angeles Branch,
Manager.
PACKARD CUYLER LEE MAXWELL
Gentlemen:
In answer to your inquiry regarding motor oils used in Packard and Maxwell cars in this territory, I am glad to say that Zerolene has given us perfect satisfaction in both our pleasure cars and trucks, and in asking our customers, who have always used this oil, they give me the same testimonial.
Very truly yours,
STUDEBAKER

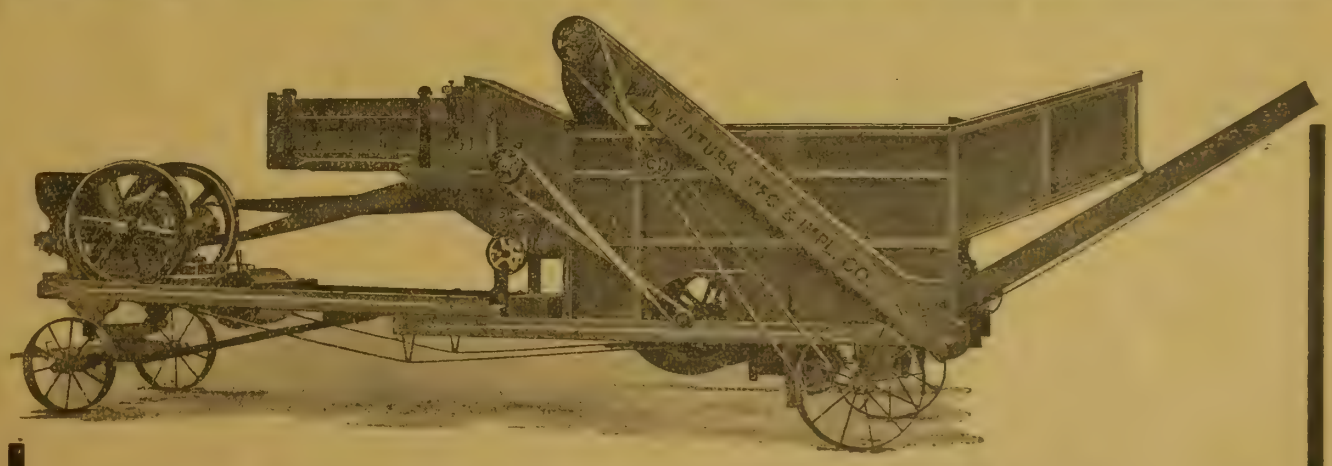
The Standard Oil for Motor Cars



Every Bean Farmer is Interested in this
There was a time when the bean growers of California tramped out their valuable bean crop on a threshing floor. Through years of patient toiling and the application of scientific principles William Hamilton, mechanic and inventor, patented and manufactured the Ventura Bean Thresher. The production of this machine has been to the bean industry what the reaper was to wheat. For twenty-one years our threshers have given universally satisfactory service. Beginning with one machine we now offer six sizes.
The Ventura Bean Thresher Junior No. 2
is now offered for the farmer who desires to do his own work in his own time. The Junior No. 2 also is large enough for a neighborhood thresher to supply the needs of several farmers with relatively small bean acreage who may be unable to wait for service from the big machines. The Junior No. 2 is the best machine in the various types now on the market. It has its own power (also without power), is substantially built, and has all the successful construction that has made our larger machines supreme in the bean threshing line. The price is within the reach of all bean farmers. It can be operated with a minimum of ten men and possessing a thresher like this you can thresh when the best opportunity is offered. Capacity 150 to 300 sacks per day. You cannot afford to take chances on bean crop losses when prices are so good when you can save your crop with a machine like this. There is a greatly increased bean acreage this year and a shortage of materials. Orders will be filled in the order received. Place your order early or you will be disappointed.
Ask your nearest dealer or write to us about it now. Free catalogue on request. We manufacture a full line of bean and beet tools.
THE VENTURA IMPLEMENT AND MANUFACTURING COMPANY - Ventura, California

FEDERAL
DOUBLE CABLE BASE TIRES

If you've never used Federal Tires try them now. Without an equal for country roads. The non-skid treads are tough and durable, give perfect traction and hold the car safely to the road in wet or slippery weather.

No matter how hard or rough the going, Federal Tires always hold fast. For down in the base of the tire four strong steel cables anchor the tire safely to the rim against the hardest kind of strains. Yet they slip off easily when necessary.

Made in white Rugged and black Traffik non-skid treads. Sold by leading dealers everywhere.

Costs $1 per Year

Twenty Reasons for Pruning

By C. H. Heard, Assistant Horticulturist, University of Arkansas

1. To remove dead wood. Dead wood harbors disease.

2. To remove injured branches (or roots). These often serve as a place of entrance for disease.

3. To allow sunlight and air to get into the branches. Sunlight and air are necessary in developing well-colored fruit and also enable the foliage to dry out quickly and hinder the development of fungous diseases.

4. To insure better size and shape of fruit. Too much wood may cause the tree to bear more fruit than can properly be supplied with food. This will result in the fruit being undersized.

5. To insure better color of fruit. If the branches are too thick the fruit will not color as it should.

6. To give symmetry and balance to the tree. A well proportioned tree will be able to hold up a good load of fruit.

7. To rebuild and give more vigor to weak parts. By proper pruning the growth of any part can largely be controlled. Weak parts may be made to grow more vigorously.

8. To restore balance between the roots and stems and in the case of planting young trees. A very small part of the roots are transplanted. It is manifestly unwise to expect less than 25 per cent of the root system to support 100 per cent of the top, as is the case when tops of transplanted trees are unpruned.

9. To make bearing more regular. Pruning has rather the effect of thinning. If the tree is not allowed to overbear, it will tend to produce a more uniform crop each year.

10. To assist in controlling disease. Fire blight, various cankers and other diseases are controlled more or less effectively by pruning. Pruning and disinfection of wounds are the only remedies of any value in controlling the above diseases. Pruning also lessens the rotting of fruit on the trees.

11. To protect the tree from winds, sunscald and other mechanical injuries. Other things being equal, low-headed trees are less susceptible to sunscald. Trees should be heavier on the side from which the prevailing winds come. This is especially important in windy localities.

12. To avoid crotches and weak limbs. A number of these crotches are found in nature. Either remove one limb entirely or prune so that one will grow much faster than the other.

13 To facilitate cultivation. By removing lower limbs which interfere and by training limbs to grow more upright where desired, cultivation is made easier. This is not to be interpreted as a recommendation for removing all the lower limbs, because these are necessary.

14. To remove crossing, rubbing and crowding limbs. These allow places for disease to enter and are in the way when it comes to picking and prunning.

15. To prolong the life and bearing period of the tree by insuring plenty of new, bearing wood from time to time. This new wood is almost always more healthy and vigorous than the old.

16. To facilitate spraying. Not only does pruning allow the person doing the spraying to get into the tree better with the spray materials, but it lessens the amount of wood to be sprayed and at the same time keeps the bearing wood within reach of the spraying apparatus.

17. To facilitate subsequent pruning. It is relatively easy to prune a tree which has received good and regular pruning in the past. Not only will there be less work to do, but it will be easier to get at the parts to be removed.

18. To facilitate picking. This, to my mind, is one of the most important reasons of all. It is of prime importance to be able to get at the fruit easily and quickly. Picking fruit from unpruned trees with crowded branches is materially more expensive than picking from well pruned trees.

19. It corrects undesirabe habits of growth. Many varieties, if not properly trained, will form very undesirable trees. If the tree is particularly heavy on the north side, for instance, pruning will correct this.

20. To improve the general appearance and value of the orchard. Few orchards are successful where yearly attention is not paid to pruning. A properly pruned orchard adds materially to one's self-respect.

Perennials of Value

Written for California Cultivator By E. Braunton

ONE of the best known gardeners in the East, for years in charge of a large crew of plantsmen, gives the following perennials as the best for cut flowers and general garden value. All are grown in California and we give short notes on each. Please preserve list for future purchase and planting.

I have always advised Anemone Japonica for north sides of buildings and shaded positions. No flower does better under these conditions and none is lovelier. I consider it one of the best flowers we grow. Local dealers have them in several shades ranging from white to carmine and purple, with fine shades of pink and lavender-pink. The white ones and the pink Queen Charlotte are my favorites. Never plant them in the sun, give rich soil and steady water supply and the flower will be of the best.

Centaurea Montana is the one recommended by our garden friend, but I would include a half dozen species, for all are excellent and the range is great. The well known sweet sultans are among the best, but are annuals. C. Montana is known as Mountain bluet and is a splendid blue, but also has white and white varieties, and of late a yellow form with brown center has been introduced. The cornflower, blue bottle, or bachelor's button is another annual sort worthy of place in the best gardens. All will thrive in full sun and there are no poor ones.

Coreopsis grandiflora is another species given special mention, but who does not know and love C. lanceolata? Like the centaureas the coreopsis are both annual and perennial, and more than a dozen good species and a full score of varieties of high value are found in some large gardens. And

again we have flowers that revel in hot sunshine, and brightest colors are developed in hottest weather.

Chrysanthemum maximum is the species of which the Shasta daisy is a variety, and though said to be a hybrid originated in California, this is doubted by some of the best plant breeders. However, it is one of the best of all the family for California, and for ease of culture, the certainty of a fine crop and to stand our hottest weather it has no superior. This is another group containing many fine annuals and perennials from little single blossoms up to the giant window mops of color so familiar to all during the cool days of autumn. All the 'mum family will thrive in the sun, but some of the same ones will do well in the shade. All need strong food and plenty of water.

Delphiniums, the larkspurs, are to be had in California, in both annuals and perennials over a range of color including nearly everything but yellow, yet with blue shades strongly dominant. Species may be had for both shade and sun, and all will grow in shade. It is a safe rule to plant annuals in full sun and perennials in at least partial shade. The better sorts do best in cool spots except when grown for winter and early spring flowers. There are no very poor larkspurs. Yet in the annuals the cheaper grades of seeds are not satisfactory.

Gaillardia grandiflora is a garden name for G. Aristata and it has many showy varieties. While there are other species, both annual and perennial, the grandiflora type is the only one at all common. While they are rather coarse flowers in all ways they are so showy, so hardy, revel in hot weather even in poor dry soil, and so very tough withal that nearly all flower lovers feel they should give them place among flowers for the dual use of house and garden decoration. They bloom all the summer long if old blossoms are kept cut. If allowed to seed heavily they cannot also bear heavy flower crops.

Helianthus is the botanical name of all sunflowers, and the range in size and form is considerable, but they are ever sunflowers to all. Sunflowers are yellow almost invariably and cannot be altogether wooed away from this color, though some are lemon yellow or of light shades, though red ones and parti-colors are now becoming common. Yet even in these varieties individuals occasionally revert to yellow. Some of the so-called reds are really brown, a few approach black, and many are a wine-red. All sunflowers, whether annual or perennial, are sun lovers. The annual sorts are usually given the popular name, and the perennials are known as helianthus. Not all are in the large flower class.

Our Eastern authority includes peonies in his list (botanically paeonia), and we will swallow the bait whole and risk getting "called down", for the largest and loveliest peonies ever grown could hardly surpass some produced in and about Los Angeles but a few weeks ago. Now for the planting, for we can grow good peonies in California. The plants are gross feeders and root deeply. Therefore give good garden soil worked over not less than two feet deep with a liberal quantity of thoroughly rotted manure well mixed in. They do best in partial shade or where shaded from sun during the hotter and sunnier hours. Plant rather deeply; the eyes should be two or three inches below the surface. The surface should then be well mulched with strawy manure or straw, for the soil must be kept cool and moist. They may not bloom well the first year if clumps are small and weak, but after that they need no change of position or interference for 20 years. Do not let seed pods form, but cut off old blooms, for the plants are thereby weakened. California can grow good peonies in all sections of the state.

Physostegias, the fall dragon's head, is not popular in California, for it is found wild only in damp soils and along stream banks in the eastern part of the United States. They are valued there because of their late flowering, usually from August on, but they may be grown here under very favorable conditions, particularly the Texan variety. Still, we have too many good plants easily grown to seriously consider the exacting physostegia.

Pyrethrum hybridum is also named, but such names are recognized only in the trade though I presume seeds and plants may be bought as such. Properly they are varieties of chrysanthemum coccineum, and from this species we obtain buhach, the California insect powder, also grown in other countries for the source of insect powders. This species is so variable in color and form that half a thousand horticultural varieties have been listed. They are all of the easiest possible culture and thrive gloriously in all parts of Callifornia.

Scabiosa Caucasica is the best perennial species of scabious and has white and lavender varieties. All are good and should be liberally grown, but the scabious or mourning bride we know, sometimes called the pincushion flower, is S. atropurpurea and its varieties, the popular annuals common to all gardens. Again must we repeat and state there are no poor scabiosas.

Veronicas are last in the list, and nowhere in the Eastern states do they thrive as they do in California, for here we grow throughout the year the fine shrubby species native to New Zealand. Some 200 species are known, and I have sometimes thought there might be a thousand, or even but a single species with a thousand varieties, so many yet so slight are the variations of color and form in both flower and foliage as well as habit. Dr. L. H. Bailey upon his return from New Zealand two years ago, told me he was very much impressed with the value of veronicas for garden use in California and was inclined to think we do not properly appreciate them.

FIGHTING FROST

Pomona's test of frost fighting appliances, with the earth, the air above it and all that is therein, opposing was pulled off according to schedule. Of all the hot weather California ever had the hottest began with the firing up of the frost pots in Pomona.

We will hold general comment on the test which was somewhat complicated by weather conditions until next week's issue. At that time we hope to talk regarding frost protection from several different angles.

But in a word we may say that at Pomona there were dozens of different heaters, even dozens of different types of heaters. There were the old time heaters that refused to observe signs of "No smoking allowed." There were heaters with tall stacks, with short stacks, and with no stacks. There were heaters operated by steam jets, by the use of a dynamo. There were heaters using kerosene and different grades of distillate. There were no electrical heaters on the grounds.

We hope to have in hand the report of the committee consisting of Messrs. E. T. Sederholm, J. E. Adamson, O. H. Hottel, H. F. Norcross and Willis Jones.

The test was a bit complicated by conditions which had existed in Pomona. Many of the townspeople are protesting vigorously because of the nuisance of smoke and soot which cause serious damage, especially in a year like the last one when orchardists fired as many as 30 or even more nights during the season. The orchardists and many of the business people maintain that the saving of the citrus crop is worth to the community vastly more than any damage which has been wrought. However, both have entered into the search for the smokeless heater. If cost were not to be considered the smokeless heater is perfectly easy. To secure it within economic bounds was the occasion for the Pomona test.

AMERICAN BEAUTY
DUST SPRAYERS
PROTECT

"A Puff in Time Saves the Vine"

The best knapsack sprayers. Kill red spider, mildew, and insects in record time. Indispensable for bean growers — orange growers — truck gardeners. Powerful bellows, perfect cloud—no waste.

Ask your dealer—or send us $12.50 for vineyard size, $14.50 for orchard size. All charges paid. Trial offer. Send for circular.

Citrus Trees

Orange
Lemon
Pomelo
Lime

Selected Buds (Pedigreed) from tested quality fruit and productive trees; Trees carefully propagated to produce a thrifty and prolific root system; Intelligently trained to induce a strong development of fruit bearing wood; Attentively dug and handled so as to insure growth when planted in orchard.

PLANT CITRUS TREES RIGHT NOW

Owing to the late spring and cool summer there is no better time in which to plant citrus trees than right now, and particularly so if you will plant our bud-selected, well rooted, carefully trained and properly packed orange and lemon, pomelo and lime trees. We have been growing citrus trees for nearly a third of a century, and hence feel convinced we can please you; that if you plant Teague Stock your orchard under proper care will earn you dividends. Direct-to-you-prices on Teague Quality Trees will effect an economy in your tree buying. Write us your wants.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly, on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Water-Frost Protection

Please advise if thoroughly wetting or soaking the foliage of an orange tree will be a protection against frost, and to what extent?—Subscriber, Lindsay.

We cannot see that there would be any advantage in drenching or soaking the tree top. If it afforded any protection whatever it would be most limited. A slight raising of the temperature has been noted by soaking the ground with water, which presumably is somewhat warmer than the atmosphere, preceding the cold. At a time of extreme low temperature which follows a drying north wind which saps the tree of moisture and vitality there is invariably greater injury to the fruit than when the same degree of cold follows a rainstorm. The lowered vitality and the lack of moisture permits of greater drying out of the fruit as a final result of the freezing. Where a single tree has been protected by a spray of water going over it during the night of freezing the fruit has been saved from serious injury but we have known of cases where the tree received greater injury because of breaking down from formation of ice over the branches.

Squash Bugs

I send bugs which are infesting squash and pumpkin vines. Please advise what they are and what will destroy them. Sprayed the vines with "Blackleaf 40" and they seemed to drink the poison as a duck drinks water. We then resorted to hand picking and caught half a bucket full. The vines are still alive with eggs.—Subscriber, Lindsay.

These are just the common squash bugs. They are very destructive, either as nymph or as adult bugs. About the only effective remedy is hand picking. As the subscriber suggests he has tried this and gathered them by quarts we presume it is getting irksome and it is unfortunate that the campaign was not started early in the spring when there was only a limited number. It would have "saved millions of lives." Spraying is impracticable on squash or pumpkin vines. That is, any spray which is strong enough to affect these particular bugs will also kill the vines. One may trap large numbers of them by placing boards or pieces of brick on the ground, under which they crawl and from which they may be gathered early in the morning. For especially choice plants in limited quantity some go so far as to cover with cages of gauze. To an extent repellants are good. Take gypsum or ashes and saturate with kerosene or turpentine and scatter around the plant. This is very repulsive to them and they will sometimes leave. All land near the plants should be cleared of weeds and rubbish and in addition plenty of fertilizer and water for the plants will help them to overcome attacks when the pest is not too serious. Hand picking of the eggs is also advisable.

Tomato Disease

What is affecting leaves of tomato plants which curl up? This complaint is general in this section. The ground is moist enough and the weather has been cool.—Subscriber, Soquel.

It is possible this is the summer blight or it may be the fall blight caused by the cool weather. If it is the fall blight spraying with weak Bordeaux 4:5:50 will save the plants. If it is summer blight nothing can save them for it has affected the tissue of the roots and the plant might stand in water and still be unable to take up a drop. It is impossible to grow tomatoes on lands affected with this summer blight or fusarium disease. In cases of this kind if subscribers will send portions of plant, both roots and top, we can be more accurate in our determinations. In this connection we may mention that a subscriber inquired regarding potatoes wilting and we suggested that from the description it was probably a blight. Examination, however, showed that every "blighted" hill had been undermined by a gopher and the entire system destroyed, so that long range diagnosis is not always correct.

Poisoning Rabbits

I note in the questions and answers columns of a recent issue reply to an inquirer regarding the jack rabbit pest. I have a similar problem to contend with and am considering the advisability of fencing or poisoning. Our local druggist quotes strychnine at $2.80 per ounce, and at this price it would be cheaper to fence. Would it be possible to obtain the strychnine at a more reasonable price and upon what kind of bait should it be used? Would arsenate of lead sprayed on young alfalfa at outer edge of field secure control? I wrote the University of California and they state there is absolutely no way to stop rabbits except by tight fencing, dogs, guns, etc. They further advise the "use of poison undesirable and not recommended." I have noticed that rabbits will eat alfalfa in preference to garden truck.—Subscriber, Lone Pine.

Wholesale druggists in Los Angeles can supply strychnine at $1.50 per ounce bottle or in quarter pound packages at $1.30 per ounce. This time of year poisoning should be comparatively easy through the use of fruits or succulents, or green alfalfa. The Brunswig Drug Company, 501 North Main Street, Los Angeles, has given us above prices.

Preserving Fence Posts

Would appreciate information as to best preservative for fence posts in light soil which ordinarily become rotten in three years.—Subscriber, Los Angeles.

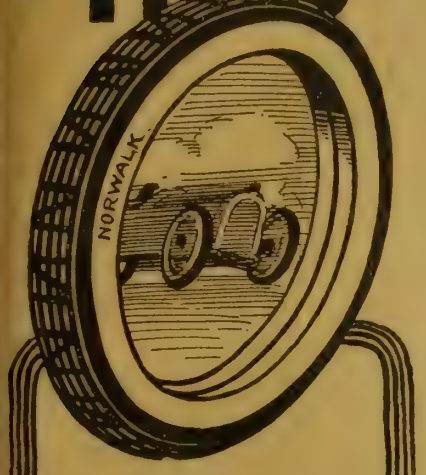
Creosote is probably the best preservative. To get best results it should be heated and the posts plunged in the hot liquid to a depth a few inches above that which they will be set in the soil. Linseed oil, tar and other preservatives are all good, and best results are obtained when these are applied hot.

Used Tin Cans

Please advise if it would be safe to use tin syrup cans and the cans in which Crisco and other shortening compounds are bought for canning fruit and vegetables, providing the cans are new and bright inside and they are properly sealed. Subscriber, Chula Vista.

If the tins are bright with no rust and are thoroughly sterilized and the tops securely sealed we can see no reason why such cans would not be satisfactory. However, this question is passed on to others and in the meantime would suggest the laying in of as liberal a supply as possible of glass or new tin cans. The prospects are much brighter than a few weeks ago for securing these.

NORWALK TIRES



These casings never falter. Every purchaser is protected with a guarantee against defects and a mileage guarantee ranging as high as 7500 miles. Few Norwalks give less than 10,000 miles of perfect service. Best for country roads. Write for price list and folder.

Green Seed Potatoes

I have a field of volunteer potatoes on sandy loam soil where some very fine potatoes grew last year. These potatoes have not been hilled up and quite a number of them near the surface have turned green. Would these green looking potatoes be all right for seed this fall? They seem to be very well matured.—Subscriber, Yucaipa.

Yes, we think these potatoes would make good seed for fall planting. When fully ripened they should be placed on the ground in a cool place for planting for the fall crop a month or two later.

Sunflower Growing

Answering a request for information as to the growing of sunflower seed in this state Mr. Reichard writes:

"Regarding the growing of sunflowers in this state, would say they are much grown in the central valleys, also to some extent in the southern part of the state. They do better in sandy loam soils though they can be raised successfully in heavier soil. The variety grown here most is the common large flowering kind. If possible to get the Mammoth Russian stock seed it is best to plant this variety as there is a better market for it. The yield is from one to one and a half tons per acre. Average price received by the grower is two and a half to three cents per pound. It requires about three months to make a crop from seeding. Seed may be sown from the middle of April to the first of July. It requires about three pounds of seed to the acre." See also Mr. Gilmore's article in this issue.

Sulphuring Fruit

Please advise amount of sulphur, if any, is allowed in sulphuring fruit for drying. — Subscriber, San Diego County.

In 1907, 1908 the United States department of agriculture made certain regulations in effect that "no dried fruits should be marketed which when dried contained a greater percentage of sulphur dioxide produced by the fumes of burning sulphur than 350 milligrams per kilogram, or the equivalent of .0035 of 1 per cent." This ruling however, was afterward abrogated and the ruling now stands practically that dried fruit shall not contain an unreasonable amount of sulphur dioxide." What an unreasonable amount is no one seems to know but so long as the department handles the matter as at present there is no apparent trouble.

PACKERS AND HOG PRODUCERS

Continued from Page 683

Our slogan in connection with the Mayrose ham and bacon advertising, "Gives the California pig a chance," has been fairly well received by dealers and consumers, and we need hardly add here that we most assuredly look to you hog producers to be the backbone of our support in your own respective communities. For the success of Mayrose hams and bacon is primarily the hog raisers success, and he is the first man to receive whatever profits are to be made from the marketing of good California hogs under our brand.

Now, we hope, gentlemen, that you will not let us run short of stock which is suitable for Mayrose hams and bacon. If you do, the consequences would be very serious to us, and even more so to yourselves. In fact, you might some day find yourselves eating an eastern ham under the delusion that it was cut from a perfectly good California hog!

While we cannot tell an alfalfa finished hog until after he is dead, there is certainly no trouble whatever in doing so at that time; so that we will make it our business to see that no cuts from such inferior hogs steal their way into the selected stock which we consider of sufficiently high quality for our Mayrose brand. We look to the hog producers of California to help us to disabuse the minds of our own people of the old legend that California hams and bacon are inferior to those produced east of the Rocky Mountains. You can do this in no more effective way than by producing hogs which will yield the kind of pork that will prove to our California people, by the infallible test of the frying pan, that it is actually as good as the eastern product.

Eastern hams and bacon in large quantities, continue to reach the Pacific Coast; although we are glad to say that, with the increased business in hog products that has come to all of the Pacific Coast packers, there has been a marked reduction in the amount of hams and bacon, and especially of lard, coming here from eastern packing centers.

I realize that I am speaking to a large gathering of men who are perhaps more interested in the breeding of hogs than in the process of fattening and marketing them. But there is no doubt in my mind that you can do a great deal of good in promoting this movement for more and better hogs by advising your customers, the feeders, to try to market heavy and genuinely well-finished stock, thus helping to bring up the average quality of our pork products which will in turn enable us to make the desired headway against our eastern competitors.

It may be of interest to you to know that our hog receipts for the first four months of the current year exceeded those of the same period of last year by 14 per cent, and that our receipts include nothing but California-raised hogs, with the exception of a very few from western Nevada.

I have before me a report covering the condemned carcasses, and parts of carcasses, for the week ending May 19th at our abattoir at South San Francisco, and you will be surely interested in knowing that out of a total killing of 3144 hogs, 86 condemned, 37 of them for sterilization and 49 wholly condemned for inedible grease and fertilizer. This condemnation is only a small fraction less than three per cent. The condemnation of primal parts and organs of these same 3144 hogs was, of course, very much higher, there having been 731 heads condemned, 700 plucks, and a total of 2184 livers. During the same period, our losses in condemned cattle were only 2⅛ per cent, about evenly divided between sterilization and fertilizer tank. In our sheep killing for the same period, our losses by condemnation, were practically nil, being only two carcasses out of a killing of more than 5000 head. It is interesting to note that the percentages of hogs and cattle condemned for tuberculosis run very close together, it being generally conceded that tuberculosis in hogs is directly traceable to the heavy percentage of tubercular dairy stock.

Now that we are under obligations to supply our allies across the sea with such enormous quantities of provisions of all kinds, it is opportune to say that in no other way can the meat production of the country be increased as rapidly as by concentrating on the raising and the proper fattening of hogs. We, therefore, assure you that the raising of hogs, and particularly of good hogs, is just as patriotic and important an American duty as the production of food in any other form.

TEPARY BEANS

Now is the time to plant Tepary Beans
When in doubt, plant Tepary Beans
In any kind of soil plant Tepary Beans
If you cannot irrigate, plant Tepary Beans
If you would prove up a homestead, plant Tepary Beans
If you want quick results, plant Tepary Beans
If you want the early buyer, plant Tepary Beans
If you have one, or 100 acres, plant Tepary Beans
If you would reclaim raw land, plant Tepary Beans
Price 30c per lb., or $25 per 100 lbs., f.o.b. Los Angeles.
If you want a sure crop and big yield, inoculate the seed with Nitrogen bacteria at a cost of about $1.00 per acre; it is equal to $40.00 worth of fertilizer.

Cultivate Your Orchard With Hercules Dynamite

THERE comes a time in the life of an orchard when great benefit results from the breaking up and redistribution of the soil around the roots.

The best way to achieve this result is by the use of dynamite.

HERCULES DYNAMITE

will do wonders for your orchard. After the soil has been properly broken up by blasting at intervals between the rows, the trees will produce more fruit and better fruit. They will grow larger and live longer. The cost of the work will quickly disappear in the increased returns.

Our book, "Progressive Cultivation," tells how soil blasting in orchards should be done. It contains other information—on tree planting, drainage work, irrigation, rock and tree blasting—that you will find interesting. A copy will be sent you free on request if you will simply fill out and mail the coupon below.

Growing Sunflowers

Written for California Cultivator By Prof. John W. Gilmore

I HAVE your letter of recent date asking for information regarding sunflowers. At the present time sunflowers in California are grown principally in the vicinity of Manteca and Modesto, in San Joaquin and Stanislaus Counties. The soil upon which the sunflowers grow most productively is the sandy loam, ranging to light sand. There are a good many soil areas of this type in California, and I have in mind especially the San Fernando Valley. It seems to me that sunflowers might be a very good crop in that valley, and I have talked it to a number of men there. There is also a good deal of this soil in Merced and Fresno Counties, and the crop could be produced in those sections profitably. However, it may be that there is a limit to the amount that the market would absorb, but upon this I am not sufficiently informed to speak. In all instances the soil should have considerable depth, be fairly well supplied with organic matter, and be free from alkali. The sunflower likes a warm temperature during the growing season, but it does not stand winds well, which may be a detriment in the San Fernando Valley.

The land for sunflowers should be prepared early and kept in good condition until the time of planting, which, in the section mentioned above, occurs about the first of April. The rows should be about 40 inches apart, and the plants may stand from 10 to 12 inches apart in the row, or they may be planted in hills of three seeds at 30 inches apart. Cultivation should be given during the growing season, as the destruction of weeds, the requirements for moisture, and physical condition of the soil demand. As a general rule irrigation is not given this crop, but where moisture supply is entirely lacking the latter part of the season, the crop responds to irrigation.

The crop is usually ready for harvest in September, and this is accomplished by cutting the blossom disks from the stalks by hand and running them through an ordinary thresher run at a relatively slow speed. The yield ranges from 18 to 20 sacks per acre, each sack weighing 70 pounds, and the selling price ranges from two and a half to four cents per pound. It costs from $15 to $18 per acre to grow the crop. The principal market for sunflower seed is for poultry feed, although there are oil mills in the vicinity of Los Angeles that buy the seed when the market is suitable for the extraction of the oil.

Fair Postponed

The following resolution was unanimously adopted at a meeting of the board of directors of the District Fair Association, held at Exposition Park, Los Angeles, May 31st, 1917:

"Whereas, the board of directors and heads of committees appointed to administer the affairs of the district fair to be held in this city next October, have decided that these are times when the president and governor have a right to expect every man to choose and execute the biggest job he can handle, regardless of his preference; and

"Whereas, it may develop that the thought and effort of those who are in charge of the details of the fair preparations may be needed in other lines productive of more direct results; and

"Whereas, the fair grounds may be needed for military purposes and the $50,000 so magnanimously appropriated by the legislature for the support of the fair may be needed for other purposes in defense of the country; now therefore, be it

"Resolved, that the Los Angeles fair be postponed until a more propitious time."

Plainly the board of directors has been guided by patriotic motives, and a bigger and better fair will be held when all can unite.

We believe there was never greater need of the inspiration and information which such a fair could induce than there is this year, but there are limits to accomplishment, and Los Angeles has chosen the more direct method of service.

Yolo County Crop Census

Written for California Cultivator By C. A. Briggs

A census that is a census, that means something, has recently been completed under the direction of William Gould, Yolo County horticultural commissioner. Eight men with automobiles were employed for 10 days, every farm in the county was visited, all bearing acres were listed and condition of crops noted. The result is most gratifying. The county has 14,750 acres of fruit and nuts in bearing, 175,918 acres of grain including rice, 38,223 acres of vegetables, a total of 328,891 acres in crops. At a conservative estimate of the harvest, priced at present prices to the farmer, this year's county income will be $11,144,783. This report has been given to the state council of defense and is a model for any county in any state to follow.

Besides being very valuable in the present crisis, this accurate information is of great interest to any party wishing information of an exact nature regarding crop possibilities in this district. The report brought out the facts that there were in the county: Barley 131,885 acres; rice 21,593 acres; wheat 19,696 acres; beans 36,537 acres. This acreage producing heavy crops at present day prices means a large addition to the county's wealth and a splendid endorsement of its production possibilities.

PACKARD ADVANCED

Announcement is made that Walter E. Packard, for many years in charge of experiment station work in Imperial Valley, is to take up work in connection with the farm bureau and farm adviser work in Southern California. This work has been extended and is calling for some of the best effort on the part of the university.

Protect Your Crops

Against the ravages of fungous disease and insect pests with the
SPARK SULPHUR MACHINE

Thoroughly coats plants, bushes, trees and vines with the dry chemical—acknowledged by commercial growers and authorities on insecticides and fungicides to be the most effective method.

and Mr. Packard's long experience in the Imperial Valley has fitted him for helping the advisers and farm bureau and the farmers.

We are not fully informed as to the work of the experiment station near El Centro but without question this work will be continued and in a way to develop new lessons for pioneers in desert farming. Mr. Crocheron will continue as superintendent of the work north of Tehachapi.

IF A FIRE BREAKS OUT

If a fire breaks out in your home use fire extinguishers, if you are provident enough to have them; but at least set everybody to work to smother out the flames with woolen blankets and rugs; to beat them out with wet brooms, and to throw on water or sand. Many a fire may be put out with little damage, if taken in time. Shut windows and doors to cut off the oxygen, and especially close skylights or windows on the upper boor, for an opening there makes an inviting flue. Get out of the upper stories as quickly as possible, for smoke and hot fumes collect there.

If forced to come through blazing halls and stairways, put a wet towel over your face, wrap head and body in something woolen, and if possible crawl along the floor.

Though you may never have a fire it is well to be provided for such an emergency. A couple of fire extinguishers in a handy place are the best protection, along with an occasional fire drill of the whole family, so each one may quickly know what to do. If you have a telephone it is well to have the numbers of the persons you would wish to call on for help posted over your phone, ready for this or any other emergency, for no one would have time to search for them in the book when need suddenly occurs.

Another wise precaution is to examine your insurance policies and see whether they permit the use of gasoline, etc.—The Farm Journal.

"BLAME IT ON THE TIRE"

He didn't pump it full enough, though
all the air is free;
He left it soft and spongy like and
scooted on with glee;
He skidded and he gridded and whopped through dust and mire,
And when it burst
He cursed and cursed,
And blamed it on the tire.

He drove it on the street car tracks
with confidence superb;
He scraped it on the lamp posts and
he scraped it on the curb;
He slammed it and he jammed it any
way he might desire,
And when it popped,
Right out he hopped,
And blamed it on the tire.

He cut it on some broken glass, but
said it didn't hurt;
He kept right on through sand and
mud, and filled the cut with dirt,
When up it blew
He blew up, too,
And blamed it on the tire.

He put on chains that ground and
chewed and gouged into the tread,
He knew his wheels were out of line,
"But what of that?" he said.
He whizzed along and sizzed along, he
picked up nails and wire,
And when it banged
His fist he whanged,
And blamed it on the tire.

Who is this man? Go ask the boys
who meet him every day.
Go ask the boys who have to hear
the things he has to say.
He bores in and he roars in with
words of angry fire,
Though he's to blame,
It's all the same—
He blames it on the tire.

—Wilbur D. Nesbit.

A Bigger Yield From the Same Field

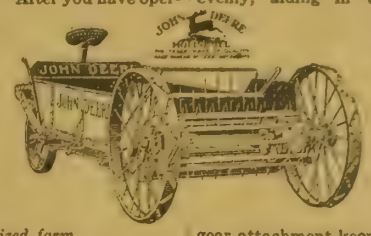
From any field that you have been manuring by the hand method you can get a bigger yield if you use the spreader method—and save much time and labor.

A good spreader tears up the manure into small particles and spreads it evenly. The manure goes farther. It can be worked well into the seed bed so that the plant roots get all of its valuable plant food. *Wasting manure is like wasting money—a good spreader makes every particle of manure count.* A Newton County, Ind., farmer testing the spreader and hand methods of applying manure on two ten-acre tracts found that the *spreader method gave 120 more bushels of corn, 140 more bushels of oats and 9 more tons of clover.*

The John Deere Spreader

The Spreader with the Beater On the Axle

has special capabilities for increasing your crop yields. Its exclusive features make it the ideal implement for the best method. Ask any owner of the John Deere Spreader about the way it increases crop yields and saves time and labor. After you have operated a John Deere Spreader of your own for a year, you will fully appreciate how much these gains really mean. *You'll find that the Spreader with the Beater on the Axle more than pays for itself in one year from the gains it gets on even a fair-sized farm.*



The beater on the axle construction *eliminates all chains, clutches and scores of other trouble-making parts. Does away with half the types of castings otherwise necessary. Does away with adjustments. Puts upkeep at minimum. Makes the John Deere Spreader exceptionally long-lived.*

Beater is all steel—practically indestructible—runs on roller bearings, aiding light draft. Beater teeth spirally arranged—tear up manure perfectly and distribute it evenly. Deliver manure close to the ground—wind does not affect spreading.

Revolving rake feeds manure to beater evenly, aiding in uniform distribution. Shock - absorbing spring relieves spreader and horses of sudden strains.

Spreader only hip-high to top—easy to load. Big drive wheels—light draft. Ball-bearing apron drive—apron travel frictionless. Simple gear attachment keeps weight of load from making apron race when spreading up hill.

Easy to operate—only two levers—one lever determines number of loads spread to the acre; the other starts and stops the spreading. It's so simple, a boy can operate it.

Wide-spread attachment for extra wide spreading.

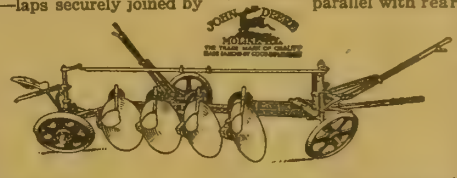
Write for booklet on the John Deere Spreader.

A Special Plow for California Orchards

Plowing conditions in California orchards demand special plow construction. A serviceable plow must stand the severe strains occasioned by the soil conditions and operate close to the orchard trees.

John Deere California Orchard Tractor Disc Plow

meets these conditions admirably. Heavy lap-beam frame—laps securely joined by heavy bolts — *no sagging — discs always in alignment.*



Discs best quality steel — *disc bearings oil-tight and dust-proof — scrapers made to stand severest strain.*

Double setting of discs permits use in very hard, dry ground as well as in loose, trashy soil.

Special "Z" land axle brings land wheel parallel with rear disc beam, permitting plowing close to trees.

Special adjustment on front furrow wheel, causing it to set inside line of front disc so that *plow will work close to trees* when soil is being thrown to them. Beam has special shape to permit working close to trees.

Write for free booklet on this plow.

Big Book Free

Better Farm Implements and How to Use Them

America must produce more food. Labor-saving implements will play an important part in increased crop production.

This book tells all about a full line of labor-saving farming implements. Tells how to adjust and operate many of them. A practica farm implement encyclopedia. Worth dollars. Illustrates and describes the following machines: Walking and Riding Plows, Tractor Plows, Disc Plows, Disc Harrows, Spring Tooth and Spike Tooth Harrows, Corn and Cotton Planters and Drills, Listers, Alfalfa and Beet Tools, Grain Drills and Seeders, Riding and Walking Cultivators, Lister Cultivators, Mowers, Side Rakes, Loaders, Sweep Rakes and Stackers, Hay Presses, Grain and Corn Binders, Corn Cutters, Stalk Cutters, Kaffir Headers, Manure Spreaders, Portable and Inside Cup Elevators, Corn Shellers, Wagons, Farm Trucks and Buggies. This big book will be sent *FREE* if you state the implements in which you are interested and ask for Package X-1110.

You Are Interested

in farm implements that save you money. The dominant idea back of the manufacture of John Deere implements is to produce tools that are economical. This means durability, easy operation and GOOD WORK.

The name "John Deere" on an implement means that these qualities are embodied in that tool.

THIS WEEK'S COVER

Maud Muller with her rake and hay is depicted on the cover this week. Fortunately California is producing an immense quantity of hay for the raking this year. More opportunity for more Maud Mullers.

FRIENDSHIP FIESTA

This is the week when San Diego is holding its Friendship Fiesta and fraternizing with its neighbors across the border. Governor Cantu with some of his "best paid soldiers on earth" with the 29th infantry band from Mexicali is joining in the festival. School children from Mexicali and Tia Juana will be present and sing The Star Spangled Banner in English. It should be a most friendly occasion.

WAR TIME

Mr. Warren H. Wilson of the committee on Presbyterian church work writes the California Cultivator regarding work which he is appealing to pastors in small towns and country sections to undertake. Specifically he recommends three things:

"The organization of the Red Cross in some form in your community. The organization of societies for securing farm loans in order that farmers may buy machinery, seed and work animals. The organization of a supply of labor."

We hope most sincerely that Mr. Wilson's recommendation will be accepted by church workers. Here is a most practical and patriotic service which will strengthen any church organization for it will give such a hold upon the people as no other service would at this moment. Many most excellent people regard the work of the church as having to do only with purely spiritual needs, but sure it is that the pastor and church which will awake to this opportunity for service will gain in both practical and spiritual influence.

RED CROSS WEEK

This is Red Cross week. One hundred millions is asked of the American people. Every cent of this great sum will be used to lessen suffering and add to comforts of those who are at the front. More correct, perhaps, is the statement that the Red Cross lessens suffering wherever it exists.

Californians are asked to contribute several millions. They will do it.

LIBERTY LOAN

As predicted last week the liberty loan was oversubscribed and to the extent of nearly 50 per cent. California did her share and nobly.

It is stated that the purchase of this great quantity of bonds will mean practically no shifting of currency or of gold so far as California is concerned, for the purchase of supplies and other expenditures in this state will, within a very few months, be far in excess of the bonds purchased. In other words, a vast sum will be put into circulation which will mean much to producers and to manufacturers of the Pacific Coast.

The best feature of this magnificent response of the people of Americe is that it is an anwswer to enemies of the country who maintained that we were lukewarm in guarding and extending the liberties of the people.

Another convincing answer to critics was the 10,000,000 registration mark which was practically reached on June 5.

The country is now ready for action, and we trust it will be much swifter than has been shown in preparation methods.

TEN MILLION HOGS

We have heard some criticism of Prof. Jaffa's statement that if the grain used in the production of strong drinks and beer were turned into hogs it would mean 10,000,000 more hogs than the United States is now raising. The state board of health apparently deems the hint worthy of sending out in its regular news bulletin. If there were one or two hogs short of the full 10,000,000 the lesson is no less emphatic. Prof. Jaffa says:

"The total amount of grain used for the manufacture of alcohol is 2,183,775,852 pounds. About 500 pounds of grain, supplemented by pasture, is necessary to raise an eight months hog weighing about 200 pounds. If this were devoted to pork production it would satisfy the requirements of upwards of 4,000,000 hogs. If the cereals used for beer were similarly applied over 6,000,000 hogs could be raised. If the grains now used for the production of distilled spirits were used for human food, there would be rendered available about 800,000 tons of edible meal, the remainder—bran, etc.—being used for cattle, hog and poultry feeds. The corresponding estimated figure for the cereals now used for beer would be approximately 1,200,000 tons. In other words, if the total amount of grains now used in the manufacture of distilled spirits and beer were used as human food, there would be produced about 2,000,000 tons of edible meal. If this were all wheat flour, it would correspond to 3,000,000 tons of bread or 6,000,000,000 one pound loaves of bread—one loaf per capita per day for two months for the entire United States."

CONSERVE EGGS

It is estimated that 13 million dozen eggs spoil in cold storage every year simply because the shells have been slightly cracked somewhere between laying and the cold room, and a plea is made for more care in handling. Expressed in one way, five per cent of the eggs in cold storage spoil because of careless handling and five per cent is even better than liberty bonds draw. Let us be more careful.

HOT WEATHER

All California has been suffering from intense heat since Wednesday the 13th, but a section of Southern California received more than its share, according to all past records, for from San Luis Obispo south to midway between Los Angeles and San Diego an abnormal condition prevailed, giving, especially to coast points which are usually exempt from these extreme heat waves, a temperature unknown.

The maximum temperature for the week as appearing on Page 703 shows conditions at various stations of the state up to Saturday. The warmest section north of Techachapi up to that time was Fresno with 108 degrees, Red Bluff reported 104; Sacramento, 104. Over on the coast and coming down from San Luis Obispo: San Luis reported 110—this only a few miles from the coast; Los Angeles reported 100. This, as will be noted in the table below, was exceeded on the day following, Sunday, by five degrees. San Diego escaped, its maximum up to Saturday being 86. The heat at other Southern California points is shown by this table.

Date—	14th	15th	16th	17th
Pasadena	106	107	108	113
Pomona	110	112	112	117
Redlands	108	111	113	114
Riverside	112	114	118	117
Santa Barbara	92	105	105	115
San Bernardino	110	112	114	116
Los Angeles	100	99	97	105

Without question heat in San Luis Obispo, Santa Barbara and Ventura Counties was fearfully increased by the fires which destroyed thousands of acres of crops, dozens of homes and cost the lives of several people.

The crop loss from the high temperatures is probably greatest with lemons and walnuts. What the result will be to oranges is unknown except that it must cause the dropping of a vast quantity. Lemons seem to be cooked on the tree. This is true not only of the small half grown fruit but of fruit ready for the harvest. In some sections this loss will aggregate almost 100 per cent of the fruit now on the tree. With the long prices promised this loss will be a most serious one.

It is probable that four or five thousand tons of walnuts will be destroyed, or at least lowered in grade so as to be hardly worth harvesting. In other words, the walnut loss is now estimated at 35 per cent.

Some beans on dry farming lands, which were just appearing above the surface, will be entirely destroyed. Most garden and small truck crops, however, will be injured but little where sufficient irrigation has been given. Some sections report heavy loss on early tomatoes. The vines are probably not seriously injured. The loss is much greater than it would have been had not the entire season up to the very day of the intense heat been extremely cool; but few trees or plants were prepared for this sudden change.

Suffering of live stock was intense and some small animals, like rabbits in hutches and chickens, died by thousands.

The interior valleys where greater heat is usually expected escaped the intense heat given to the coast sections.

Agricultural Notes

The government on May 2 took over Italy's entire supply of wool for the 1917 clip.

An interstate cereal conference of federal and state workers was held in Kansas City, June 12-14.

The extraordinarily good rice crops of the Far East assure discontinuance of imports of wheat and wheat flour.

A very large cabbage crop is indicated in all states of the Union; peas also will be a universally heavy crop.

Medical camps for the training of doctors for army service have been established at Fort Riley, Kansas and Fort Benjamin Harrison, Indiana.

California's tomato crop on June 1 showed almost perfect condition against a three-quarters normal production condition on June 1 last year.

Eighty carloads of potatoes were shipped last winter into the United States from Moncton, New Brunswick, in October at $1.00 per bushel; in April at $2.00.

Large plantings of eucalyptus and acacia trees have been for some years made by the Italian government in North Africa in Tripoli and Cyrenaica. Orders are given for the planting of 50,000 more eucalyptus trees this year in Tripoli, mostly along the railways.

California is the largest grower of cantaloupes in the Union, the 1917 acreage being 17,300. Arkansas is second with 6900. Colorado last year was second. Arizona this year has 3400 acres planted. The crop is three weeks or more late this year owing to the cool weather.

Resolutions asking that immediate steps be taken to regulate grain prices were telegraphed to Washington by the Holstein-Friesian Association in convention at Worcester, Massachusetts, on June 8. A price from 15 to 18 cents a quart for milk before fall was predicted unless relief is secured.

Ostrich farmers of South Africa have fallen on hard times. Many schemes have been discussed for reviving the feather trade. It has been suggested that the government be asked to fix and maintain prices. Whether or no the government can influence Dame Fashion remains to be proved.

The United States department of agriculture says there is no simple test for distinguishing between edible and poisonous mushrooms; "the only safe mushrooms to eat are those gathered by a collector who knows exactly what he is doing." A new Farmers Bulletin, No. 796, describes and illustrates mushrooms.

The weather all through Europe up to April 20 was rainy and cold, when warmer days brought more encouragement to crop raisers. France, Great Britain, Italy and Switzerland on May 1 showed crop conditions below average. The whole southern hemisphere, whose wheat crop is now harvested, shows a three-quarter crop.

Brazil and Argentine together now take 80,000 barrels of American apples and 65,000 boxes of American pears each year, and the trade is growing steadily. In both Brazil and Argentina the American apple is supreme in the high class trade, and its sale is limited only by the number of people who are able to pay the rather high prices asked for it. The American pear is especially well liked in Brazil and Argentina.

Agricultural News Notes of the Pacific Coast

Northern California

Noyo, Mendocino County, will soon have a $10,000 salmon cannery completed.

Glenn County has signed up 5000 acres of rice in the Pacific Rice Growers' Association.

An agent of the French government has been in Butte Valley several weeks buying horses.

Napa County is harvesting a bigger crop of hay and grain than was taken off the fields last year.

Knights Landing expects to have a half million dollar barley crop. There are 9000 acres in barley in that district.

The Humboldt County Dairymen's Association will hold its annual picnic on July 29 at the Loleta picnic grounds.

Many farmers of Biggs, Butte County, are preparing to sow beans on their land as soon as the barley crop is harvested.

The rice crop of the district about Biggs, Butte County, is very promising. The mills are still running on last year's crop.

The California Associated Olive Growers' Association announces that the entire crop for the season 1917-1918 has been sold.

The Anderson-Cottonwood Valley of Shasta County will have a quarter of a million dollar fruit crop, according to estimates of several fruit growers.

The California Associated Olive Growers' Association is planning to erect a mill at Oroville, Butte County, and another at Lindsay in Tulare County.

Forest Supervisor Hammatt of the Shasta national forest reports that 1000 more cattle and 17,000 more sheep are grazing in the forest this year than last.

President Stephens announces that over 10,000 acres of rice have been signed up by the Pacific Rice Growers' Association. A campaign is being made to increase the membership.

Because of the cool weather Vacaville's fruit shipments are very much behind the usual record. On May 30 last year 93 carloads of fruits had been shipped. This year there were only 15.

At the Swine Breeders' meeting at Davis on May 30 all former officers of the California Swine Breeders' Association were continued in office. It was decided to hold a donation sale for the breed.

Experts from the state university are studying the grasshopper problem of the northern part of the Sacramento Valley. Hordes of half grown grasshoppers are said to be getting ready to make onslaught on the fields of the valley.

The Canners' League of California at a recent meeting in San Francisco pledged the output of the canneries of California to the United States government. Committees were named to make a survey of all the cannery products in the state.

The Hereford breeders at their recent meeting at Davis elected H. H. Gable of Esparto president, W. D. Duke of San Francisco vice president and Winfield Madden of Dixon secretary-treasurer. It is the intention to make this organization one unit of a Pacific Coast Association, to cover Washington, Oregon, Idaho, California and Nevada.

Central California

The General Grant park was opened June 1.

Valencia oranges are now being shipped to the Eastern markets.

The Peach Growers' Association has withdrawn quotations on practically all grades.

Two carloads of honey, valued at $10,000, were shipped last week from Lindsay to El Paso.

Missourians of Stanislaus County will hold their annual picnic June 23 at Graceada Park, Modesto.

The Merced Cow Testing Association has become merged with the farm bureau testing association.

The annual meeting of the board of trustees of the California Peach Growers' Association was held June 12.

The Merced County farm bureau plans the organization of a farm fire protective league to protect growing crops.

There is to be no protest from Fresno wine men and grape growers because of proposed tax increase on brandy.

Fifteen per cent additional payments are being made to creditors of the Tulare Cooperative Creamery Company.

Cattle shipments from the Porterville district for the spring of 1917 will total $500,000 in value, according to estimates of local cattlemen.

The campaign to secure a farm adviser for Tulare County has been closed. Seventeen counties in California now have farm advisers.

The Rancho Dos Rios, a 3500-acre tract at the junction of the Tuloumne and San Joaquin Rivers, has been purchased by a colony of Russians.

It is announced that sweet potato plants from Merced hotbeds are being exported to other parts of the state at the rate of 1,000,000 a week.

County Horticultural Commissioner Roullard of Fresno County urges vineyardists to spray immediately if they would control the grape leaf hopper.

June 1 and June 8 were designated as squirrel poisoning days throughout Tulare County. Poisoned barley was distributed free at nine different points in the county.

The chamber of commerce of Dinuba has rescinded its former action in recommending bringing of Asiatic labor to California to help in the harvesting of heavy crops.

The Central Stockmen's Association held a meeting at San Luis Obispo Saturday, June 2, at which Hubbard Hollister was elected secretary in place of W. S. Everets, resigned.

Several suits have been filed against the San Joaquin Light and Power Corporation by owners of grain fields who claim they were destroyed by fire caused by employes of the company.

More than 1500 ranchers, dairymen and poultrymen attended the picnic of the Dairymen's Cooperative Creamery Association and the Tulare Cooperative Poultry Association at Mooney Park, June 7.

The grain harvest is now under way in the San Joaquin Valley. It is estimated that 100,000 bags will be shipped out by water before the waters recede and make navigation impossible to the higher points.

Southern California

Fishing is now allowed in the San Fernando reservoir.

Imperial County has nearly 115,000 acres planted to alfalfa.

Imperial Valley this season shipped out 50 carloads of green peas.

Palo Verde hopes to get government aid in the building of a levee.

It is announced that a sorghum mill will be erected at Indio this fall.

Early parcel post shipments of figs were made in quantity from Thermal.

An onion grower of the Coachella Valley reports the sale of 5000 crates at $1.85.

Arlington's new cannery is busy on its first run. Sauerkraut is its first product.

Total vegetable shipments from Southern California for the past season were 7645 cars.

Heavy shipments of Valencia oranges are now being made from Southern California.

The cannery of the Hemet-San Jacinto Growers' Association is ready for the packing season.

The Mound Farmers' Club of Ventura County held a basket picnic at Foster Park June 21.

Coachella Valley's onion crop this year is estimated at $500,000. There will be about 700 carloads.

The Imperial Irrigation District has voted $2,500,000 bonds to cover two years' work in improving the system.

The Pomona Fruit Growers' Exchange expects its ninth pool of navels to bring at least two cents per pound.

California has over 17,000 acres planted to cantaloupes. Over 13,000 acres of these are in Imperial County.

A crop survey of Riverside County by the state council of defense shows a bean acreage of 50 per cent above normal.

A short course in poultry was conducted at Van Nuys the 13th, 14th and 15th by J. E. Dougherty of the University of California.

At the June 4 meeting of the Yucaipa Apple Growers' Association growers were informed of the workings of the Northwestern Fruit Exchange.

The walnut crop of Southern California has been cut down by the hot weather the past week. The prospects have been for an unusually heavy output.

The apricot crop of the Redlands district is estimated by the Review at 65 per cent of normal, with practically the entire crop contracted at $46 per ton.

A number of poultrymen of Arlington attended the last meeting of the San Bernardino County Poultry Association to talk organization and cooperation.

Serious forest fires have burned over large areas of the Santa Barbara national forest, taking many cultivated acres, as well as brush and timber lands.

Apricot growers of Ventura County are busy gathering their crops. Prices for apricot pits are 15 cents for a 50-pound box, 50 per cent more than was paid last year.

W. E. Packard has resigned as superintendent of the state university experiment station at Meloland and will take charge of farm adviser work in Southern California.

The Coast

Farmers of Chandler are considering a plan for enlarging the Eastern canal.

Kings County, Washington, will hold its fair at Renton September 14, 15 and 16.

The farms on the Arizona side of Needles are menaced by the floods of the Colorado.

In the crop survey of Arizona the district about Higley is shown to have 2278 irrigable acres.

A peppermint farm of 100 acres is being planted near Sifton in Clarke County, Washington.

Loganberries in some sections of Marion County, Oregon, were seriously damaged by cold weather.

The Stock Growers' Association of Cochise, Arizona, will hold its annual meeting at Douglas in September.

The Spokane branch of the federal farm loan bank has already approved loans for more than $1,300,000

The Vancouver cannery opened June 1 on spinach. This will be followed by gooseberries, then strawberries.

C. B. Kegley of Spokane was elected master of the Washington State Grange at the recent annual at Wenatchee.

At the recent annual session of the Washington State Grange at Wenatchee there were more than 800 representatives.

Indians on the Sacaton reservation of Arizona are threshing their wheat and barley and getting the ground ready for corn.

The Okanogan County Grange Fair will be held at Okanogan October 11-13. There will be an especially large exhibit of live stock.

There has been great activity in sales of range lands in the Yakima Valley of Washington, over 40,000 acres having been sold since the beginning of the year.

A highway will be built from Metcalf, Arizona, to the northern boundary of Greenlee County. Two hundred thousand dollars bonds have just been voted for this purpose.

J. W. Brewer, manager of the Dallas chamber of commerce, has been appointed to take charge of the food survey in Morrow, Gilliam, Sherman and Hood River Counties, Oregon.

Contracts have been awarded for the construction of immense storage reservoirs along the Deschutes River in Central Oregon, for the irrigation of 100,000 acres of land in Agency Plains.

Three federal agents are to be put into the Inland Empire to help in making the change to the bulk system of handling grain. The grain producing sections of Oregon, Washington and Idaho will be covered.

An agent of the United States bureau of markets has just completed a census of farm crops in the Salt River Valley of Arizona. He is now trying to interest farmers in forming cooperative marketing organization.

The Womans Club of Chandler, Arizona, has served notice on neglectful owners of stock that they will be prosecuted. Many cases have been found where horses and cows were tied up short and left in the blazing sun without water all day.

The DE LAVAL LINE

ACME FEED CUTTER and SILO FILLER

The Only Steel Frame Cylinder Cutter on the Market

The steel frame is strongly riveted. It can't warp as does the old style wooden frame. All bearings and shafts are held in rigid alignment at all times and vibration and wear reduced to a minimum.

BUILT FOR CAPACITY

The large throat of the Acme Feed Cutter, the Automatic Feeding Roller, and the improved design of the Traveling Feed Table gives the machine ENORMOUS CAPACITY and makes it very EASY TO FEED.

Knives are of special steel, ground on the inside, spiral in shape, and produce a uniform, perfectly cut silage that packs well in the silo.

BUILT IN SEVEN SIZES

The wide range of sizes makes it adaptable to all cutter requirements.

THE ECONOMY OF CUTTING DRY FEED

The coarse hay usually nosed out and wasted by stock will be entirely consumed as food if first run through an Acme Feed Cutter. You can actually make a saving of $3.00 to $5.00 per ton by this method.

ALFALFA MEAL

An attachment for making alfalfa meal from alfalfa hay can be fitted to the Acme Cutter and an excellent grade of meal produced at a cost of less than half the cost of baling.

IF YOU ARE INTERESTED IN ECONOMICAL STOCK FEEDING SEND FOR ACME CUTTER CATALOG and the DE LAVAL DAIRY HAND (which is a veritable gold mine of valuable dairy data). A postal will do.

DE LAVAL DAIRY SUPPLY CO.

61 Beale St., San Francisco, Cal.

Our Contracts Will Help You to Buy and Own a Farm

Young Man, NOW is life insurance a closer BUSINESS PARTNER than ever before. The younger you are the LOWER THE RATE for a sure, safe, policy, THROUGH LIFE. You can save a great deal by taking out a policy now.

Many take out our policies when buying a farm or other property as a double protection against loss. If the insured lives, then by success and through his efforts he pays for the property. If death intervenes the insurance PAYS THE MORTGAGE and the beneficiary has an income property free and clear.

Life Insurance is a blessing—an incentive to thrift and a protection to all we hold most dear. We especially invite you to investigate the very attractive policies written by

The Great Republic Life Insurance Company

We have complied and are complying every day, with Section 634 of the Political Code which protects every policy holder with every safeguard.

This is a Company composed of Californians who have their interests in this state—your own Company with the head offices of the Company here in Los Angeles easily accessible to every policyholder, and existing under the Laws of California.

Our Twenty Pay and Endowment Policies are Investments, not taxes. Nearly every citizen buys one or more policies sometime. The longer you wait the more you pay for any insurance.

We are looking not only for men who may now or later invest in life insurance but for local representatives who may occasionally have a few hours to represent us.

Write us at 626 So. Spring street, Los Angeles, and we will become better acquainted.

THE MODERN METHOD of IRRIGATING ALFALFA

The indications are that all prices will continue to advance, and it will be cheaper to install your irrigation system now than it will be later on. Do not wait until next year to figure out what you would have made if you had acted now.

In spite of the high prices and shortage of all manufacturing materials, we have a full supply of all Irrigation Appliances on hand at convenient distributing points all over the Pacific Coast, and are prepared to make prompt deliveries throughout the season. Don't delay. Time is money. Write today.

Kellar-Thomason Company

1226 East 28 Street Los Angeles, Cal.

"Originators of the Valve System of Irrigation"

Ration for a Young Boar

Written for California Cultivator By F. W. Woll

REPLYING to your request for information as to the proper growing ration for a young Berkshire boar at ten months, would say that good results may be secured by various methods of feeding, and the special method to be adopted will depend upon the available feeds. It may be stated in general that a boar should receive feeds that will develop a good strong constitution, and rations with a tendency to fatten should, therefore, be avoided. The best roughage that can be provided is good alfalfa pasture or cut green alfalfa, and in addition he should receive as much grain as he will clean up readily. A pound or two daily will be ample. This may be ground barley alone or a mixture of two or more standard hog feeds, like barley, oats, grain sorghum middlings, dried beet pulp, cocoanut meal, etc.

The following mixture will very likely be as cheap as any in these days of high feed prices: beet pulp, milo and cocoanut meal, mixed in the proportion of 2:2:1 by weight. Wheat middlings may be included in case either milo or beet pulp cannot be obtained or is more expensive than middlings.

There is no better single feed for growing hogs than wheat middlings. It contains a considerable proportion of protein and valuable mineral components, with only a small amount of fiber. Beet pulp, on the other hand, is rather high in fiber and low in ash materials. Cocoanut meal is valuable on account of its protein and fat contents, but is not particularly palatable to hogs, and on account of its laxative effect must be fed sparingly. All the feeds mentioned have approximately similar feeding value and the choice may be made, therefore, largely on the score of relative cost.

Pontiac Clothilde De Kol 2d 69991

The first cow to produce 37 lbs. butter in 7 days, 145 lbs. in 30 days, and 1271 lbs. in a year. Also the first cow to make over 30 lbs. butter in a week in three successive lactation periods. She sold for $2600 (at 13½ years of age) and a ten-months-old son sold for $6100. She is a three-quarters sister to King of the Pontiacs and is the dam of the splendidly bred bull, It, recently sold by Stevens Brothers to McAlister & Sons.

Report of San Joaquin County Cow Testing Association, May, 1917

By W. F. Elder, Tester

WITH the addition of several new members the San Joaquin County Cow Testing Association reports a very successful month. In order that future reports may equal or surpass the record of this month it is desirable that all members sign up for a year's work, thus assuring the permanent success of this department.

Following are the five leading herds in butterfat production for the past month, giving owner, number of cows, average pounds butterfat: Gotshall & Magruder, 17, 45.3; F. J. Kell, 18, 41.9; R. W. Fisher, 22, 35.9; E. M. Thorpe, 11, 35.5; O. Fowler, 26, 33.9.

Following are the five leading herds in milk production for the past month, giving owner, number of cows, average pounds milk: Gotshall & Magruder, 17, 1331; F. J. Kell, 18, 1156; E. M. Thorpe, 11, 1005; County Farm, 31, 963; O. Fowler, 26, 931.

The following cows produced 50 pounds or over of butterfat during the month, giving owner, name or number of animal, breed, pounds milk, test, pounds butterfat: Gotshall & Magruder, 13, H, 2120, 4.3, 92.1; Mrs. E. C. Clowes, 35, H, 1854, 4.4, 81.4; R. W. Fisher, 17, J, 1398, 5.3,74.1; F. J. Kell, 447, H, 2285, 2.9, 66.3; 101, H, 1810, 3.6, 65.2; N. H. Locke Co., 133, J, 1190, 5.4, 64.3; Gotshall & Magruder, 11, H, 1888, 3.3, 63; F. Fiori, Dinah, H, 1562, 4, 62.5; H. T. Bailey, 61, H, 1618, 3.7, 59.5;. Mrs. E. C. Clowes, 10, H, 1513, 3.9, 59; E. M. Thorpe, Colly, H, 1339, 4.4, 58.9; F. J. Kell, 16, H, 1218, 4.8, 58.5; 66, H, 1720, 3.3, 56.7; Gotshall & Magruder, 4, H, 1541, 3.6, 56.1; N. H. Locke Co., 118, J, 691, 8.0, 55.3; F. J. Kell, 65, H, 1445, 3.8, 54.9; R. W. Fisher, 12, ..., 1215, 4.5, 54.7; O. Fowler, Daddles, H, 1556, 3.5, 54.4; N. H. Locke Co., 394, J, 849, 6.4, 54.3; J. Fiori, Roanie, H, 1383, 3.9 54.1; F. J. Kell, 63, H, 1795, 3, 53.8; S. Gronner, 1509, H, 1324, 4.1, 53.8; Mrs. E. C. Clowes, 53, H, 1652, 3.2, 52.9; C. Holman, 1, PD, 1320, 4.0, 52.8; 30, H, 1423, 3.7, 52.7; Oak Grove Dairy, Kate, H, 1370, 3.9, 52.4; J. Fiori, Blue, H, 1228, 4.3, 52.4; R. W. Fisher, 25, ..., 1159, 4.5, 52.2; Gotshall & Magruder, H, 1345, 3.8, 51.5; County Farm, 67, H, 1838, 2.8, 51.4; N. H. Locke Co., 390, J, 949, 5.4, 51.2; H. T. Bailey, 44, H, 1646 3.1, 51; O. Fowler, Brindle, —, 1181, 4.3, 50.8; Mrs. E. C. Clowes, 112, H, 1265, 4, 50.6; Gotshall & Magruder, 2, H, 1897, 2.7, 50.2.

From California to Chile

Written for California Cultivator By C. A. Briggs

A. W. Morris and Son of Woodland have recently sold a fine young bull to Ramon Nieto of Santiago, Chile. A straight clean cut youngster of fine color and markings and royally bred, he will add to California's glory and the wealth of the Southland. His name, Segis Pontiac De Kol Burke 6th, tells of the lines of blood to which he traces. His sire, Segis Pontiac De Kol Burke, a four time grand champion, already has eight A. R. O. daughters, while the young fellow started his show record by capturing the first prize for calf at the California State Fair of 1916. His dam, Miss Blaney, has records of 27.60 pounds of butter in seven days, 1008 pounds butter in one year from 20,740 pound of milk averaging 3.09 per cent of butter fat. She has a 30.05 pound butter daughter with a yearly record of 1025 pounds of butter. The average record of his dam and sire's dam is 29.95 pounds butter for seven days and 1047 pounds butter for one year. The sale was made through Mr. E. Susaleta of Santiago who is at present taking a course in the state university. This sale puts another of the Morris bulls in good hands, as the purchaser, Mr. Nieto, is the largest breeder of Holstein cattle in Chile and one of the largest in the entire continent of South America.

Romneys at the University Farm

THE university farm has lately added to its flock six choice Romney ewes recently imported by Mr. S. H. Coffin of North Yakima, Washington. They arrived at the university farm on May 5 after being in quarantine in San Francisco two weeks. They were bred previous to importation and will lamb in August and September.

They were bred by the famous Romney breeder, Mr. E. Short of Pararangi Station, Feilding, New Zealand, and are yearlings past. They show good Romney character, are deep bodied, of good weight and carry a very desirable fleece.

The ram was bought at the P.P.I.E. being exhibited by the New Zealand government and was the first prize ram lamb. He was bred by Mr. William Perry of Masterton, New Zealand, and is a very active, robust ram of good bone and carrying a good fleece. At one year's growth he sheared 19.5 pounds. He weighs in breeding condition 275 pounds and will be three years old this fall.

The Romney is rather a new breed in the states. The principal breeders are in Oregon, Washington and California. The Miller & Lux Estate of San Francisco, John E. Marble & Co., of Los Angeles and the University of California are the only breeders of Romneys in this state.

The breed originated in a low lying tract of land or marsh in the county of Kent in Southeastern England and is known as the Romney Marsh although the American association has dropped the latter word. They were good grazers, rarely receiving any feed other than pasture throughout the year. The breed is noted for being very hardy and because of being raised on low ground is often referred to as being resistant to foot rot.

They are a long wool breed, producing a heavy fleece of wool six to eight inches long at 12 months. Rams weigh from 250 to 300 pounds and ewes from 175 to 225 pounds. They are hornless and have white faces and legs. The sheep readily adapt themselves to either range or farm conditions and are used a great deal in crossing with Merinos on the ranges in Australia.

Romneys

Ram and six ewes on University of California farm at Davis. The university farm has introduced some fine blooded stock, so far as possible representative of all breeds.

Don't Take a Chance with Sick Hogs

"Don't take a chance with a sick hog. Act quickly. Get a veterinarian or a trained man immediately. Don't wait a single hour when you suspect disease in your herd. Use the telephone or send to town at once. Only prompt action will stop hog cholera losses. Every hog saved will help win the war."

The time for argument about anti-hog-cholera serum is past, declare the specialists of the United States bureau of animal industry. Explicit figures are readily available which prove unmistakably that when administered in time by competent persons, hog cholera serum will keep well hogs from taking the disease for a period of three to six weeks. Not argument, but quick action is imperative to get serum and a trained operator to the farm to treat the hogs. Hogs will be saved and the nation's meat supply increased if every farmer

You need a new

DE LAVAL SEPARATOR NOW

1st If you are still using some gravity or setting process of creaming—

BECAUSE YOUR WASTE IS greatest and quality of product poorest in mid-summer when the milk supply is heaviest.

BECAUSE TIME IS OF GREATest value on the farm at this season and the time and labor saving of the good separator counts for most.

BECAUSE THE SKIM-MILK IS poorest without a separator in hot weather and often more harmful than helpful to calves.

BECAUSE THE WORK OF A New De Laval Cream Separator is as perfect and its product as superior with one kind of weather as with another.

2nd If you have a very old De Laval or an inferior separator of any kind—

BECAUSE THE LOSSES OF THE poor separator from incomplete skimming and the tainted product of the hard-to-clean and insanitary separator are the greatest at this season.

BECAUSE OF THE GREAT economy of time at this season in having a separator of ample capacity to do the work so much more quickly.

BECAUSE THE NEW DE LAVAL is so much simpler and more easily handled and cared for than any other, and you can not afford to waste time these busy days "fussing" with a machine that ought to have been thrown on the junk-pile long ago.

BECAUSE THE DE LAVAL SEPARator of today is just as superior to other separators as the best of other separators to gravity setting, and every feature of De Laval superiority counts for most during the hot summer months.

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency simply write the nearest main office, as below.

DE LAVAL DAIRY SUPPLY CO.

LARGEST DAIRY SUPPLY HOUSE ON THE PACIFIC COAST.

CUTTER'S
BLACKLEG PILLS
"California's Favorite" for nearly 20 years
For the Prevention of Blackleg in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest.

Prices:
10 dose pkge. Single pills $1.00
50 dose pkge. Single pills 4.00
10 dose pkge. Double Pills 1.50
50 dose pkge. Double Pills 6.00
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

The Napa County farm bureau is making a labor survey of the county. School children are being listed.

will immediately upon sign of disease call in the nearest available expert to diagnose the complaint and administer whatever treatment is necessary.

Because a single outbreak of hog cholera on any farm is a matter of moment to the entire community, and because hog cholera infection is rapidly spread in many ways employ every possible measure to keep the disease out of herds. The department has issued a special hog cholera poster, "Stop Hog-Cholera Losses," which gives specific directions for avoiding infection by sanitary and self-quarantine measures; also directions for the isolation and treatment of cholera-infected hogs and directions for disinfection and restocking the hog lot. Farmers' Bulletin 834, soon to be published, contains the latest information at the command of the department of agriculture concerning hog cholera prevention and the immunization of hogs against the disease.

More Beef

The State Council of Defense for California has issued the following appeal to live stock breeders:

CALIFORNIA owes it to the nation to produce more beef, declares the committee on resources and food supplies of the California state council of defense.

But the ranges of the state are already stocked—they can carry no more cattle. Now Professor Gordon H. True of the University of California college of agriculture has pointed out a solution of the problem:

There must be no more two year-old steers on the range.

There must be more breeding cows on the range, instead of steers.

The selling by range cattlemen of all steers two years old means that they must be sold as feeders, and the valley farmer must buy and feed these steers for market.

Most stockmen have failed to grasp the fact, says Professor True, that it the strictest economy to feed steers for the greatest possible gain while they are young, since young cattle make cheaper gains than older stock. The first winter is the critical time. It is then the animal must be fed if he is to go to market at an early age. The grand champion calf, bred and fed at the university farm, which beat the whole world at the last International Livestock Exposition in Chicago, was only 13 months old, and weighed over 1100 pounds.

The day of the Texas Longhorn has passed. There is far more profit in animals of the improved beef breeds—Shorthorn, Hereford and Aberdeen Angus. These beef-bred cattle have deeper flesh and earlier maturity.

Good breeding pays. Good feeding pays. And this is how California can produce more beef and yet cut down the number of steers and increase the number of breeding cows on the ranges.

Gone to Chile

Segis Pontiac De Kol Burke 6th, sold by A. W. Morris & Sons, to be shipped to Ramon Nieto, Santiago, Chile. See Mr. Briggs' article on page 695.

PACIFIC NATIONAL DAIRY SHOW

Secretary F. A. Welch of the Pacific National Dairy Show announces dates of the Pacific National Dairy Show for 1917 as November 16 to 23, inclusive, at which time a general exhibit of dairy stock, dairy machinery, and dairy products in general will be displayed at Portland, Oregon. The directors of the organization are planning for a very large show and find that much interest is being taken in the Pacific Northwest in dairy stock breeding and general developments in connection therewith.

In five or ten years the practice of intensive dairying will wholly change a poor farm. It will yield an income each year that will permit of better fences, better farm buildings and improved conveniences about the house. Conservatively speaking, a 1000-pound dairy cow will produce from one-half to three-quarters of a ton of manure per month. If plenty of bedding is used this amount will be increased. If all the manure is properly conserved, if raw rock phosphate is used to reinforce the manure, a five to ten per cent increase in the crops every two or three years will not be uncommon.

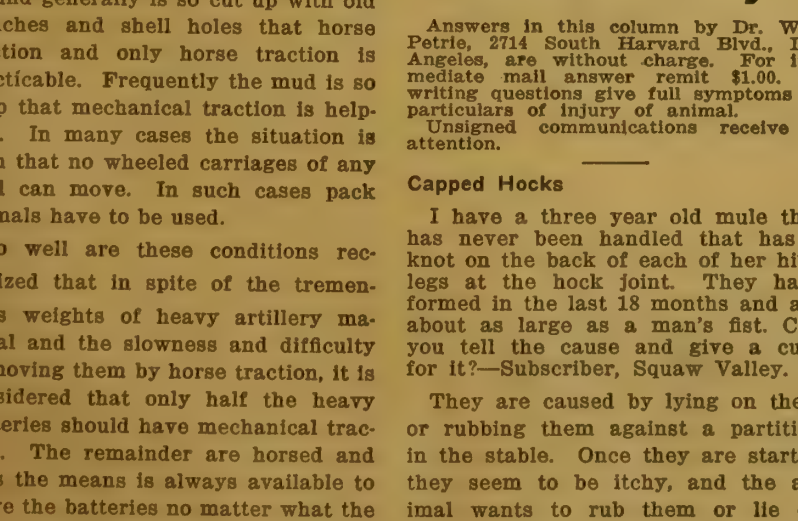
Horses are Indispensable in War

There seems to be a rapidly increasing opinion that the day of the horse in war has passed. The nearly three years of warfare in Europe has shown this to be an entirely erroneous idea. On the Eastern or Russian Roumanian front where there are few good roads, the horse has not only held his own for the mounted services such as cavalry and artillery, but also for supply purposes. Again and again the armies operating on this front have found the arrival of supplies and ammunition dependent upon the use of horse transport. Even on the Western front where the road system is probably the best in the world, mechanical traction has not been able to displace the horse. In general it might be said that the line between mechanical and horse traction on a battlefield is the extreme limit of the enemies artillery fire when any heavy action is going on. The horse is used on the battlefield and the mechanical traction in rear of it. Of course during calm periods mechanical traction is used along the rear part of the battlefield. There are various reasons for this division. Probably the main one is that batteries frequently must be placed and supplied in positions some distance from a road. Often the country to be traversed is so rough that a tractor cannot get over it. If the army is operating on conquered ground, this ground generally is so cut up with old trenches and shell holes that horse traction and only horse traction is practicable. Frequently the mud is so deep that mechanical traction is helpless. In many cases the situation is such that no wheeled carriages of any kind can move. In such cases pack animals have to be used.

So well are these conditions recognized that in spite of the tremendous weights of heavy artillery material and the slowness and difficulty of moving them by horse traction, it is considered that only half the heavy batteries should have mechanical traction. The remainder are horsed and thus the means is always available to move the batteries no matter what the difficulties. Therefore, in general it may be said that an army must still have animals for all its cavalry, the usefulness of which is far from disappearing; it must have horses for all its light field artillery, half its heavy field artillery, and all its regimental and divisional supply trains. Incidentally every regiment of infantry must have several hundred horses and mules. The more the question is examined, the more two facts stand out. The first is that certain work in modern warfare can only be done by horses. The second is that the number of horses needed for armies, which are counted by the millions, must be counted by the hundred thousands.



King of the Pontiacs 39037

The great King of the Pontiacs who has 202 A.R.O. daughters; 115 proven sons. At 13½ years of age sold for $10,500 at the Stevens Brothers dispersion sale, May 15, 16 and 17, 72 of his daughters selling at the same sale for $89,325, an average price of $1241 a head. "King" has 19 daughters that have made from 30 to 44 lbs. butter each in 7 days, and 113 other daughters with records of between 20 and 30 lbs. in 7 days.

FIELD NOTES
From the Live Stock Men

Recent Sales by the A. W. Morris Company include a bull to Raleigh Scott, Crescent City, King Spofford Mead sired by King Mead of Riverside out of Linden Spofford Promise De Kol who has a seven day record of 26.70 pounds and a yearly record of 840 pounds; a bull to J. A. Kinney, Litchfield, sire, Segis Pontiac De Kol Burke; a bull to Geo. E. Spencer, Blythe, sired by King Mead of Riverside out of Parthenea Agnes 2nd, an 800 pound dam. His full brother was sold recently for export to Hong Kong. Another bull went to W. H. Otterson of Glenn.

Superintendent Wm. Taylor of Santa Anita Rancho reports the sale and shipment of registered yearling Berkshire boar, Anoakia Duke No. 224835, to the Kamehameha School, Honolulu, Hawaii. This school has a very splendid herd of Berkshires and will use this boar to head the herd.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Capped Hocks

I have a three year old mule that has never been handled that has a knot on the back of each of her hind legs at the hock joint. They have formed in the last 18 months and are about as large as a man's fist. Can you tell the cause and give a cure for it?—Subscriber, Squaw Valley.

They are caused by lying on them or rubbing them against a partition in the stable. Once they are started they seem to be itchy, and the animal wants to rub them or lie on them, and thus keeps up the irritation and increases the swelling. They are hard to cure because the cause continues. If you could prevent the mule rubbing them or lying on them they could be reduced by applying an ointment made of tincture of iodine three ounces, iodine crystals one dram and lard oil to make six ounces. Apply once a day and rub in well.

Santa Anita Rancho
Anoakia Breeding Farm

ARABIAN THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three-year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars. Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

Giving the Bees Room

MANY beekeepers make a serious mistake in failing to give their bees enough storage room on time. The addition of this room at just the right time for the storage of the season's crop of honey requires good judgment and an intimate knowledge of the nectar resources of the particular locality and season. It is exceedingly important during the few weeks of heavier flow that the progress of the work in the supers be watched closely and additional room be given as rapidly as the bees can use it.

The usual procedure by the inexperienced beekeeper is to put on a super of 25 to 50 pounds' capacity during early spring and give the subject no further thought until late summer or autumn. If the super is found to be full of honey at that time, it is removed and probably an empty one put in its place. In many cases this empty super is given long after there is any possibility of any further storage of honey during the season and if comb honey is being produced the sections and foundation are ruined for further use by being on the hives during a time when no honey is being stored.

During a poor season a single super for each colony may furnish an abundance of room for the storage of the entire crop of honey but, during a good season, if additional supers are not given as needed, the major portion of the crop is lost to the beekeeper simply from lack of storage space.

With such a good honey flow several supers may be completely filled with honey before any of it is ripened and sealed and the hive may have therefore as many as five or six supers at one time. Under such conditions, if the bees are compelled to ripen and seal the honey in the first super before a second one is given, most of the possible honey crop is lost to the beekeeper, the bees being compelled either to swarm or to loaf during the height of the storing season. Such an abundant honey flow does not by any means occur every year but when it does occur, the beekeeper should be prepared to take full advantage of the opportunity.

Bees need so little attention during the greater portion of the year that it is difficult for the inexperienced beekeeper to realize that for the best results almost daily attention is needed during the few days or weeks known among beekeepers as the honey flow.

STATE FAIR

September 8 is the opening day of the 1917 state fair at Sacramento. As heretofore the Native Sons and Daughters of the Golden West will be the prime movers in many of the features which will be pulled off during the fair. The directors announce that a program surpassing previous efforts is being arranged. One of these features will be a historical pageant of California life and a musical contest in which it is estimated that at least 50 bands will enter. The fair will be held for a week and a day.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Partnership Funds

A and B started a partnership with a few hundred dollars with which they purchased a farm. A took charge of farm. B sent money to pay hired help as his share. A surreptitiously acquired a piece of real estate and started paying for it in installments from cash proceeds of the ranch. A claimed he was given the land, but the installment receipts showed that he bought it. This was ten years ago; since then it has become valuable. Partners have separated with ranch holdings but still own real estate together. Is there any redress and if so what are the proceedings? — Subscriber.

B could without question upon the facts enforce his partnership interest in the property purchased by A, as an agent or partner can take no such advantage of funds entrusted to his hands. The fact that ten years have elapsed since the discovery would seem to indicate that B was not sure of his case. While in case of fraud the statute of limitations is three years from the time of the discovery, it may be that this does not apply. It is a case which you should take to an attorney in your vicinity who can make a detailed investigation of the facts.

Agreement

Is the following agreement sufficient to give wife full ownership of property and is it legal? "(Dated) This is to certify that I have given and signed over to my wife all the property real estate and personal property and I herewith assign all to (name of wife) from the above date from now on and forever.—(Signed)".

The instrument might be good as an holographic will, if entirely written, signed, and dated in the handwriting of the husband, but as it is not testamentary in character there is doubt in that respect. It is insufficient as a deed to any real property as it does not describe the property nor is it acknowledged; it is insufficient as a bill of sale of personal property as it does not describe the property. It could undoubtedly be enforced against the husband and the property intended secured under an action brought for the purpose.

Avoiding Probate

Could I have a deed drawn up on my real estate and personal property so that if I or my wife should die first the property would revert to the other without any cost of probate court? I have children. How is the Torrens deed?—Subscriber.

In order to procure property to be held under joint tenancy with right of survivorship in a case such as the above it is necessary to deed the property to a third person, both husband and wife joining in the deed; the third person then deeds said property to the husband and wife as joint tenants with right of survivorship. Upon the death of either of the joint tenants the survivor has vested in him the whole of the property right. In order to establish the chain of title of record it is necessary to establish the death of the deceased joint tenant by appropriate proceedings in the probate court, which have heretofore been described. The same results are obtained by filing a homestead upon the property in the declaration of which both husband and wife join. That method is simpler, less expensive, surer, and affords complete protection not only to the survivor, but to the children of the marriage as well. Conveyances under the Torrens title act do not greatly differ in their effect from such as have heretofore been employed; it is rather a different method of registration of titles than passage of title, although there is some difference. Wills and administration of estates have been established through a long period of time as the best method of handling the estates of deceased persons; variations from the established rule have frequently led to expensive litigation entailing much family bitterness.

RIVERSIDE FAIR

Riverside fair dates chosen are October 9-13. The directors state that this is the second largest county fair in California and they will make greater efforts this year than ever before for a great exhibit. This year's effort is largely for the encouragement of greater and better production for the sustenance of the armies of our government. The directors are appealing to every live stock breeder and to every producer to produce the best and save the finest for this fair.

ALL THE YEAR ROUND

Cooler cooking in summer—better and more economical cooking all the year 'round.

A good oil stove will cook anything that any wood or coal range will cook, and do it better because of the steady, evenly-distributed heat.

All the convenience of gas. Meals in a jiffy, and a cool kitchen in summer.

The long blue chimneys prevent all smoke and smell.

In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

TOGETHER

Together we'll laugh at the dawn of the sun;
Together we'll smile till the evening is done,
Together, together, the day and the weather
Are evermore fair when we two are together.

We'll sing at the clouds and we'll cheer at the rain,
And thunder must roar in a rollicking strain
As together we tramp through the wild wood and heather,
For the whole world rejoices when we are together.

The sad wind upleaps in a frolicsome glee;
And from woeful willows a bright melody
Sounds through our revel when light as a feather
Our heart's fare the highways of beauty together.

Together, together, we'll laugh in the sun
And smile till our evening of gladness is done.
Together, together, the days and the weather
Will always be merry when we are together.
—St. Louis Post-Dispatch.

DICKY BIRD'S WOOING

"NO, Mr. Dicky Bird, I will not marry you, marry you, marry you," trilled pretty Rose Lee, as the swing with her dainty weight flew lightly into space and the flutter of her white dress with its ruffles and ribbons and the gleam of her golden hair wrought further ruin in the heart of the youth, her present companion and willing servitor.

"Why not, Rose, dear Rose?" pleaded the young man, ignoring the name bestowed upon him as the swing with its winsome burden came swiftly to his hands again. The youth and maiden were neighbors and lifelong friends and now accepted by their little world as an engaged couple. For these two the river of love ran a smooth and tranquil course undisturbed by anything more tumultuous than the ripples caused by the sportive pebbles of their own flinging.

Past experience, therefore, had taught the young man that to resent the appellation of "Dicky Bird" would only serve to increase the mirth of the dearly loved but tantalizing sweetheart. The fact that his name was Richard Budd, and now with the distinguishing adjunct of attorney-at-law, was all too well known to his tormentor. But even so long ago as pinafore days she was wont to prick his childish pride by her mischievous call of "Dicky Bird, Dicky Bird", only to redouble her mockery when her playmate showed confusion.

"Say 'yes,' Rose dear," as again the swing responded to his forceful push.

"No, Mr. Dicky Bird, no, no, no," and the words floated into the treetops on the wings of a silvery laugh as the fair maiden again reached the zenith of her flight.

It was the old swing down in the orchard, or rather a new swing in the old place, for the former weather-beaten rope and seatboard lay in an abandoned heap and at present formed a springy, yielding platform under the feet of the stalwart, quick-eyed youth who with each successive return of the new swing involuntarily braced his strength and deftly caught and impelled forward its burden, each time to the refrain of his own entreaty:

"Rose, won't you marry me?"

"Oh, delicious," was the dreamy response, as a straying curl and a frill of lace from the flowing sleeve willfully brushed against his cheek.

"Rose, dear Rose——"

"Rapturous," and Rose breathed a sigh of perfect content, apparently oblivious to all except the exhilaration of her ride.

"Rose, please——"

"Positively entrancing," and Rose closed her eyes and with beatific countenance and saintly mein ignored all thoughts of earth and its allurement.

"Rose, darling——"

"Simply glorious; ah, if one might only swing forever."

"Rose, you must——"

"Absolute bliss," and Rose leaned her head against the rope in the curve of her dimpled arm and swayed the swing from its rythmic course just far enough to allow her elbow to smartly box the ear of her ardent wooer, who on tiptoe and with outstretched arms was taken unaware by this maneuver. Dr. Dicky rubbed his smarting ear and groaned.

"This must stop," said he, in tones that suggested the limit of a long strained patience, as he held the swing board captive.

"Rose, will you, or will you not? I am tired of being trifled with. Every body thinks we are engaged, and it is time we had a serious understanding. This is a suit which I intend to settle right in this term of court, and there will be no appeal and no judge or jury either; the testimony has gone far enough."

"Why, you ridiculous Dicky Bird, you nearly spilled me to the ground with you vehemence," rippled forth the musical laughter of the willful Rose, who was not all disconcerted over the earnestness of the situation. "Keep on swinging, Dicky; don't talk nonsense in this enchanting, bewitching, soul-satisfying atmosphere Swing, Dicky, swing with care, and remember, sir, that I am your passengaire."

"Not another swing, Rose, until you tell me why you will not answer me."

"Swing, Dicky Bird, swing with care."

"Tell me," repeated Dicky sternly.

"Oh, Dicky, this is really unkind in you. Why, I want to marry a hero, a real genuine hero. Are you a hero, Dicky?"

"May I ask what is your benevolent interpretation of a hero?" inquired Dicky, wrath and devotion struggling for mastery.

"Oh, a man who does things—saves lives from fire or drowning or something else that threatens their destruction—flags trains that are running toward broken bridges, captures burglars, goes to war, sacrifices himself in some way for the good of others."

"I could do all of those things, and more too, and make no fuss about it either," said Dicky, bottling up his wrath and smiling down at his tormentor who, still seated in the swing, her pretty hands grasping the rope high up and with sleeves falling away to the elbow, and with winsome face upturned to his, made a most attractive picture.

"Oh, Dicky, I wish you might have the chance, for then I would be sure."

"Sure of what?"

"Oh, sure, just sure."

"Oh what? I insist on knowing, Rose."

"Just sure you ridiculous Dicky; now swing me please."

A strange cry and the rapid crunch of footsteps caused both to turn.

"Get behind the tree, Rose, quick, behind the tree!"

With one hand Dicky thrust the girl behind cover and with the other jerked the old swing board from beneath his feet. In another instant he had brought down the board with the strength of a young giant on the body of the oncoming intruder, a creature in the semblance of man, foaming in insane frenzy, and whom Dicky recognized as an escaped lunatic from the Dixdale asylum some few miles away and for whom the authorities had been searching for several days.

The maniac staggered beneath the blow but still lunged forward on murderous intent, the strength and fury of a baffled beast in his swirling arms and clawing hands.

"Keep close behind the tree, Rose," said Dicky in steady tones. He could hear Rose shriek as he met the maniacal lunge with another blow that split the old board in two. The man reeled to the ground, bleeding and stunned. In an instant Dicky wound a coil of the heavy rope about the ankles of the man and another twist pinioned arms and body, while Rose, frightened, but light footed, obeyed commands and swiftly sped away for help.

Dicky magnanimously refrained from asking any further definition of

a hero when later he sat with Rose on the veranda of her father's residence and continued his interrupted wooing.

"Oh, Mr. Budd, I cannot tell you how much I am indebted to you," broke in Rose in some agitation. "You really saved by life and I never can be sufficiently grateful."

"Call me Dicky," demanded the hero with savage emphasis.

"Oh, Mr. Budd—Richard—really I am under great obligation."

"Call me Dicky," and the hero's tones were positively threatening.

"Oh, Dick—Richard"—and the voice of pretty Rose quivered with merriment. "I cannot very well do that any more. I must break myself of the habit before we are married. How perfectly silly it would be to have our dear friends dubbing us 'Mr. and Mrs. Dick Bird.'"—Journal of Agriculture.

HINTS ON CANNING

Written for California Cultivator
By Martha

PUTTING up fruit is a laborious process, taking it from beginning to end, and no pains should be spared to make it successful. Care in the selection of cans, tops and rubbers is necessary in order to obtain the best results. It is not well to use jars unless you are sure they can be made airtight, for while sugar is the keeping power of preserves we must rely on perfect cans for canned fruits and vegetables, and if the air is entirely excluded from the fruit it will keep as well without sugar as with it, and fruit canned without sugar has a fresher taste.

Before beginning the work of canning fruit, buy a roll of the very best cotton batting, cut rounds of it just the size of the top of the fruit cans and place one on top of the fruit as soon as the can is filled and seal it immediately. The cotton excludes all the air, and if any particles of mold form they adhere to the cotton and can be lifted out without spreading into the fruit.

Nearly half the labor of canning is saved if all the cans are made ready before hand. The best way to clean new glass jars and tin cans is to wash them in warm suds and then rinse with hot water in which a little borax is dissolved, as this not only purifies but leaves the cans bright and shining. One of the best ways to clean and sweeten all glass jars and covers that have been used is to put as many in the boiler as it will hold without crowding, then sprinkle two large spoons of powdered borax over the jars and shave in enough soap to make a good suds, cover with cold water and let boil and steam for half an hour or longer. Remove from the stove, rinse and drain, and they will be as fresh and clean as new jars, and even old musty and sour jars can be freshened in this way, only more borax must be used if the jars are sour or discolored as this is the purifying agent. Some housekeepers rinse out all old and new jars with hot borax water before using to be sure they are thoroughly cleaned and purified.

If you are using tin cans be careful to heat the lids before pouring on the sealing wax, for if the wax is put on a cold surface it will soon become loose and the can of fruit will be spoiled.

SALT RISING BREAD

No doubt many persons prefer the salt rising loaf of old times to the newer yeast breads. My recipe never fails if proper care is given. Scald one cup of fresh milk at night, and while hot stir in one cup of corn meal, then set in warm place over night. In the morning add one cup of sweet milk to one cup boiling water and when lukewarm, add one quarter teaspoon soda, one-half teaspoon salt and one cup of scalded meal. Thicken with one-third meal, two-thirds flour, then set the mixture in a vessel of warm water to rise. When foamy and light, add two quarts water—half sweet milk is better—two tablespoons of sugar, lard the size of an egg, and salt to taste. Pour this into flour which has been previously warmed, mix stiff, knead well and mold into loaves. Put in well greased pans and set them in a warm place to rise. When risen to twice its original size, bake in a hot oven. In warm weather I raise both yeast and bread in the sunshine.

MAKING THE OLD NEW

When the springtime comes and the leaves come forth and the flowers begin to open, making the world look new again, then it is that people instinctively begin to brighten up things, so as to be in harmony with nature.

Women, with their sense of the esthetic, are particularly given to cleaning up. A little varnish on the furniture, a stain on the floor and a polish on the metal, and the home looks new and cheerful again.

Most of the preparations for this purpose are easily applied, and they will do wonders in the way of reviving the new appearance of surfaces that have become old and worn.

BIAS FOLDS

Many people do not know of the prepared bias tapes with turned edges that may be bought at almost any dry goods store. The tapes come in various widths, ranging from one-quarter inch to an inch or more. They may be had in lawn or cambric and in solid color or striped ginghams and percales. They are much truer than those made at home and make neat finishes on wash garments.

Baking day is full of joys,
For little girls and little boys.
Sister bakes the cake, 'tis true,
But brother eats it when she's through!

SALISBURY STEAK

One-half pound steak. Scrape on both sides until nothing is left but tough fiber. Mould the scraped meat into a little cake and broil it over coals until hot, not too long. Season and serve on toast. Scraped beef on toast is good.

The First Six Weeks With Baby Chicks

Written for California Cultivator By Jean A. Koethen

THE care of chicks is largely a matter of detail. Many caretakers ignore this detail, and giving their birds warm quarters, a ration of chick feed and dry mash and moderate cleanliness, leave the rest to Providence. Their chicks do fairly well, too, but there are more losses and more culls than when a more careful system is followed. I have been surprised in visiting poultry farms this spring to find how many different systems of feeding young chicks are followed, all admirable and all successful, but nowhere have I found a system more scientifically worked out or more carefully followed than at the Palm Avenue Poultry Yards at Gardena.

On this little ranch, containing not more than an acre or two of ground, about a thousand chicks are raised each season. The brooder house which is 30 feet long by 14 feet wide, is divided into 12 runs, each 32 inches wide by 6 feet long and designed to accommodate 100 chicks. Like all well constructed brooder houses this is nearly all glass on the south. Each indoor run is matched by an outdoor run of equal size, the two being connected by a tiny door which is raised by a pulley, so that the chicks may go in and out at will on pleasant days and yet be quickly confined when necessary. As these brooder runs are raised above the level of the alley back of them, and all grain bins as well as brooders are ranged along the alley, it is possible to care for the chicks with very little stooping and without leaving the building till every brooder is cleaned and every hopper and fountain filled. The brooders, which are of the hot water type, have false bottoms which can be removed and cleaned with a single motion, making the daily cleaning a very simple matter. The water fountains stand on slatted platforms where the chicks can easily reach them, but can never scratch litter into them, and the mash hoppers are slatted with round holes along the sides for the chicks' heads. The use of these round holes keeps the chicks from crowding and gives each one its chance to eat.

When the hatch is nearly over all the unhatched eggs are collected into one small incubator where they may hatch if they will without interfering with the welfare of the hatched chicks. Lamps are turned low, ventilators opened, and the chicks kept quietly in the nursery for 24 hours. The next day they are removed to the brooders but are given no food till they are about 48 hours old. This first day in the brooder they have access to charcoal and grit all day but do not receive their first meal till just before bed time, which is about four o'clock.

This first meal is dry and very simple, for the chicks are in no pressing need of food but must learn to eat and to look for their scratch grain in the litter which covers the floor of the run. The following scratch mixture has been previously prepared: 50 cents' worth (about 10 pounds) of rolled oats, the same amount of steel cut oat and 25 cents' worth of cracked rice. To this add 50 pounds cracked wheat, 9 quarts cracked milo and 9 quarts Egyptian corn. A single handful of this mixture in the litter for each 100 chicks is all they get for their first meal. As soon as they have eaten this, or pecked at it, which is all most chicks will do at first, they are tucked away for the night.

Real feeding begins the next day, which is the third after hatching. A handful of the mixture, or a little more if the chicks will eat it, is thrown in the litter every two hours, which makes five meals. The next day the number of meals is reduced to four and the amount increased as required. On the fourth day the following mash mixture is set before them: Six pounds each of bran, shorts and beef scrap; 4 pounds corn meal; 2 pounds cocoanut or soy bean meal; ½ pound charcoal. This is not left before them, but is removed after an hour and then set before them again for an hour early in the afternoon. The next day the mash hopper is in the run for two hours and then removed. After this it is left in the run so that the chicks may eat whenever they are inclined.

When the chicks are put in the brooder, 100 in each, two runs are left vacant, but they do not remain vacant. From the first day the sharp eyes of the mistress of the ranch are on the watch for weaklings. Chicks which do not eat well, which stand around moping or lag behind the others in development are spotted and removed at once to one of the empty brooders. In a short time the strong and the weak are automatically separated, and each has a better chance because of the separation. Chicks which are obviously diseased or runts are put out of the way without ceremony.

The grain feed from the first is always a mixture, and for this very excellent reason: It often happens that a change must be made. Wheat, for instance, goes up and must be dropped. Egyptian corn cannot be obtained. If one of these is dropped from the mixture, the chicks hardly notice it, while an entire change would upset them.

When the chicks are two weeks old the feeding of sprouted oats begins. The oats are fed as soon as the roots show and before the green appears. There is no better growing feed than oats at this stage of sprouting, and the chicks are given all they will eat once a day until they reach maturity.

When the chicks are six weeks old the pullets are removed from the brooder house to the roosting house where they will remain, and the cockerels are placed in the fattening pens. The process of segregating pullets from cockerels, like that of separating the weak from the strong, is begun in the brooder pens as soon as sex can be noted. As soon as comb development indicates a cockerel he is taken from the run where he began his brooder existence and placed in another devoted to cockerels. In a short time each run contains either all pullets or all cockerels, and the birds have become accustomed to their future mates.

When the pullets are moved to their new home no attempt is made to put them on the roosts, but they are given a slatted platform under the roosts and are confined here by a wire screen till they have learned where to go at night. When they are ready for the roosts they take to them like a duck to water, and the platforms are removed.

Storrs Egg Laying Contest

Storrs, Connecticut.—Report for the thirtieth week May 29, 1911.

The feature in the laying contest at Storrs is a new weekly pen record; not only for the current contest but for the past four years, or during the whole time that ten birds have been required for entry. Three years ago Tom Barron's pen of White Leghorns from Catforth, England, laid 63 eggs in one week or a yield of 90 per cent. This record stood until just about a year ago when the new breed from Corvallis, Oregon, set the mark one higher, making it 64 eggs in a week. Two weeks later a Pennslyvania pen of White Leghorns entered by P. G. Platt of Wallingford equalled this weekly yield of 64 eggs, but until now no pen has been able to beat it. The honor falls to a pen of Barred Rocks owned by Fairfield Farms, Short Falls, New Hampshire. For the first five days of the contest week this pen made perfect scores, then they laid nine and eight, or a total of 67 for the week, a yield of nearly 96 per cent. As a matter of fact, these birds would be credited with 69 eggs in seven days if the contest week ended on Monday instead of on Tuesday. And their efforts are by no means temporary and spasmodic, for this is the best pen in the Plymouth Rock class and second best in the entire contest.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Fairfields Poultry Farms, 1206; Merritt M. Clark, 1037; Michigan Poultry Farm, 933.

White Wyandottes

Merrythought Farm, 1125; Obed G. Knight, 1030; Joseph Moreau, 979.

Rhode Island Reds

Allan's hard to Beat Reds, 1154; Jacob E. Jansen, 1099; Geo. W. Harris, 1096.

White Leghorns

A. P. Robinson, 1280; J. O. LeFevre, 1144; Hilltop Poultry Yards, 1140.

Miscellaneous

Obed G. Knight (White Orpingtons), 1048; Holliston Hill Poultry Farm (White Rocks) 1034; Cloyes & Sullivan (Buff Wyandottes), 1029.

HEARTLESS

"Why didn't Rastus marry dat Coopah gal?"

"Oh, she dun flunk at de last minute —wouldnt lend him a dollah foh t' git de license wif."—Boston Transcript.

Charles M. Schwab, the steel king, once remarked: "I have always felt that the surest way to qualify for the job just ahead is to work a little harder than anyone else in the job one is holding down."

HAY

Under date of June 16 Scott, Magner & Miller say:

Receipts for the week amounted to 1433 tons. The most of this has been old hay and has moved into consumption from day to day as it has arrived. It has been placed at market quotations. It is expected now that warehouses will be entirely cleaned up during the coming week and that from then on markets must depend on new crop. There has been an occasional car or two of new hay arriving recently but not enough to establish any market basis. Harvesting is going on rapidly and a great deal of hay is now offered in different districts. The weather recently has been excellent for curing hay and the quality of the crop is excellent. The demand for export account has not been active although there has been a little moving from time to time. First cutting alfalfa still continues to arrive in moderate quantities and is being placed without difficulty. There has been no second cutting in the market as yet but some expected very shortly. There is no straw arriving and probably there will be no new straw in the market for a month or so. Prices given below are on old hay only.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market. For prices to consumers charges of cartage, commission and handling expenses must be added.

Citrus Fruit Market

LOS ANGELES, June 20, 1917.

Valencias are finding quick sales and at long prices. A few sales reach as low as the $3.00 mark and many are being made above $4.00. Large sized fruit is being discounted to an extent.

The lemon market is in splendid condition. The crop will be greatly reduced by the hot wave and it is presumed that the few cars in storage (less than 2000) will soon be cleaned up. Experts are in the orchards to determine the extent of the injury. It is yet too early to give any percentages.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 29,047 cars, lemons 6409, total 35,456; to same date last season, oranges 24,153, lemons 4583, total 28,736. From Central California to date this season, oranges 4475, lemons 164, total 4639; to same date last season, oranges 5390, lemons 146, total 5536. From Northern California to date this season, oranges 845 cars; to same date last season, oranges 610, lemons 1.

The improvement of rural highways and the building of good roads lay a new responsibility upon every farmer. The farmer and his home life are now brought more directly to the attention of the general public. The improvement of the home grounds does not necessarily imply spending great sums or building an extensive show place decorated with architectural furnishings and formal gardens. It means treating the yard as an out-of-door living room, as a part of the house. It means keeping it clean and neat and comfortable and cheerful. It should be decorated with fine trees, beautiful flowering shrubs, and with annual and perennial flowers that fill the soul with gladness and make home a lovable spot surrounded by endearing associations, that tug at the heart-strings and give the full meaning of "Home, Sweet Home."

The indications are for a splendid crop of strawberries in the Hood River district of Oregon.

GET READY NOW!

Put your farm on a basis of big crops—big profits—no labor troubles. Use Smith Form-a-Tractor and be one of the 30,000 progressive farmers who will make a 75% saving in their farm costs this year.

PROTECT YOUR INTERESTS

Regardless of how busy you are now—take a few minutes and protect your own interests.

If a day off now would put $400 into your pockets you would not hesitate to take it.

That is what a few minutes taken now to order your Smith Form-a-Tractor, will do for you. And if you own a big farm, it will add even more.

For Smith Form-a-Tractor costs $400 less a year to operate than four farm horses—and does every bit of work the best 4-horse team you own can do.

NOW IS THE TIME TO BUY

Farmers all over the country who bought early, used SmithForm-a-Tractors in Spring plowing—drilling—cultivating—and are already getting a tremendously increased yield from their land.

Profit by their experience. They have proved Smith Form-a-Tractor for you. The results they are getting are definite—and they are so big that you cannot afford to overlook them. Get ready for your late plowing—do your binding and harvesting with Smith Form-a-Tractor. Now is the time to buy.

DO ALL YOUR WORK

The day you put Smith Form-a-Tractor at work for you will be the day you get rid of horses — and you know horses are costly to maintain—subject to all kinds of disease—affected by weather—easily tired—and only 7% efficient. Smith Form-a-Tractor gives you the high efficiency of the automobile motor—over 22%.

It can be worked in all kinds of weather—will do its work 75% faster than horses—plow seven acres to every four plowed by horses—do other work with the same big time-saving—and while it uses your Ford for the power plant, it gives you the Ford touring car for pleasure driving in fifteen minutes after you drive your tractor out of your fields.

THE BEST AT ANY PRICE

You cannot buy your tractor on the basis of price alone. You must buy it on the basis of what it is and what it does. Smith Form-a-Tractor is a thoroughly proved tractor. Every detail of design and construction has been carefully worked out.

It has many exclusive features:

1—A radiator that guarantees perfect cooling—replaces Ford radiator. **It will not overheat.**

2—An oiling system that gives perfect lubrication—stays on the car permanently.

3—A sub-frame that extends the full length of the Ford but that is removed completely when change is made back to touring car.

4—10-inch tractor wheels—for soft soil without packing.

5—15 minutes change from touring car to tractor or back again.

You must have these features.

Frost Fighters Demonstration at Pomona

With the price of steel making manufacture and sale of orchard heaters within economic bounds very difficult, and with a heat wave causing material dropping of the fruit in citrus orchards, citrus growers feel this year is putting up most severe problems to them. However, they are investigating and endeavoring to turn every way to force success. A demonstration or test of various heaters has been held at Pomona. Almost every conceivable way of creating heat with as little smoke as possible has been attempted. The upper left-hand picture shows one of the air compressors or blowers used in the Glass system. Mr. C. N. Burton, with the derby hat, is discussing the work of pumping the air to atomize the oil. A double pipe line carrying compressed air and oil goes from the blower to various portions of the orchard. Standing by Mr. Burton is Mr. Hibbard, who is demonstrating this heater. Lower left-hand corner shows several of the heaters, the one being inspected by the corps of three men is the steam oil burner. The steam from the tank is used to atomize the oil in the burner. The heater in the lower left-hand corner of the picture is the Klunk & Wheeler kerosene heater. The upper right-hand corner shows Mr. Kodima demonstrating the stack attachment. Lower right-hand corner, Mr. Green of the American Can Company is standing between two burners which had been burning for eight hours at the time the photograph was taken. No soot had gathered, and, as may be seen in the photograph, no smoke is escaping. These heaters are equipped with the Simpson stack. See article on third page of this issue.

We are going to GIVE AWAY

Home Steam Canners

Get one for yourself—the plan and work is easy and you can save $100 or more on your grocery bill.

California Cultivator is going to give away **Economy Home Canners,** one of the handiest, most economical and successful Home Steam Canning devices ever made. Anyone accustomed to cooking can put up fruit and vegetables rapidly and successfully with the Economy Home Steam Canner. Directions as to how long to steam and otherwise handle fruits and vegetables are sent with each canner. The work is easy and to secure one will only take a few minutes' effort among some of your friends.

Get a Canner Like This and Save Money on Your Grocery Bill.

The Economy Home Canner and Cooker is a scientifically made canning vat 24 inches long, 10 inches deep and 12 inches wide with steam tight cover made to hold 16 quart jars at a filling. It has two bottoms, one inside the other. The inside one is so made that the fruit jars set on it above one gallon of water. It is perforated.

This arrangement necessitates only a small amount of water and therefore minimum fire. The top or lid closes down inside a steam tight suction slot, making it possible with the canner and cooker to retain great steam heat, thoroughly cooking and sterilizing whatever is inside. Directions for putting up fruits and vegetables and how to get best results from using the Economy Home Canner and Cooker will be sent with each order filled. Any housewife accustomed to cooking can operate one of these canners successfully. It is quite possible for one person to can from 50 to 75 quarts of fruit or vegetables in one day after the fruit is prepared. When not in use as a canner it can be used as a steam cooker and it makes a valuable bread or cake box, lunch or picnic kit.

Owing to the high prices of canned foods and the shortage of tin cans, it behooves every housewife to put up as much foodstuffs as possible from California's great crops. If this is not done by individuals everywhere, rich and poor alike, hundreds of tons of foodstuffs will go to waste in California soon, when, a little later, high prices will be paid for similar eatables that are canned and when thousands of p e o p l e throughout the world are going hungry, some actually starving.

Pitch in and help conserve the Nation's food supply.

Here is our proposition to you—If you will send us only 10 yearly subscriptions (at least five of which are new ones), to California Cultivator at $1.00 each, or 5 for 2 years at $2.00 each (of which 3 are new), total $10.00 in subscriptions, we will send you one of these Economy Home Canners prepaid to your address. Part may be one-year and part two-year subscriptions, just so the amount is $10.00.

You can get these subscriptions in a few minutes to such a well known reliable paper as California Cultivator. Some find it a good plan to go in with four others, each paying $2.00 for a subscription and then the club owns the canner. They then get together, going from home to home, putting up each others' fruits or vegetables. This affords recreation and enjoyment and gets the work done. You won't know how easy it is until you try. You can soon get a club of 5 or 10 subscriptions.

OUR GUARANTEE—Anyone accepting this offer who is not entirely pleased with the canner may return it at once in good condition and the entire amount sent will be refunded. Some who have these canners say they have saved $100 on their year's grocery bill and wouldn't take $25 for their canner if they couldn't get another.

FOREMAN WANTED

A large, successful and progressive citrus ranch desires to secure the services of an experienced foreman who has proven ability to head what is planned to be a model organization. Liberal salary is offered with interest in profits and the opportunity to gain a prominent place in the citrus industry. Address Box L, care Cultivator.

When writing advertisers, mention The Cultivator.

The New Oliver Nine

Was $100 Now $49

A TYPEWRITER REVOLUTION

New Machines for Half the Former Price

At the very height of its success, The Oliver Typewriter Company again upsets the typewriter industry. Just as it did in 1896, when it introduced visible writing and forced all others to follow. Now this powerful Company—world wide in influence—calls a halt to old expensive ways of selling typewriters. It frees buyers of a wasteful burden.

A company strong enough, large enough and brave enough to do a big, startling thing like this, deserves a hearing.

The full facts are set forth in our amazing exposure, entitled "The High Cost of Typewriters — The Reason and The Remedy." One copy will be mailed to you if you send us the coupon below.

HOW WE DO IT

Henceforth The Oliver Typewriter Company will maintain no expensive sales force of 15,000 salesmen and agents. Henceforth it will pay no high rents in 50 cities. There will be no idle stocks.

You, Mr. User, will deal direct now with the actual manufacturer. No middlemen—no useless tolls. We end the waste and give you the savings. You get the $51 by being your own salesman. And we gain economies for ourselves, too. So it isn't philanthropy. Just the new, efficient way of doing business to meet present-day economic changes.

Note this fact carefully. We offer the identical Oliver Nine—the latest model—brand new, for $49, the exact one which was $100 until March 1st.

THE LATEST MODEL

Do not confuse this offer of The Oliver Typewriter Company itself of a brand new latest model 9 with offers of second hand or rebuilt machines.

This is the first time in history that a new, standard $100 typewriter has been offered for $49. We do not offer a substitute model, cheaper, different or rebuilt.

Read all the secret facts in our document, entitled "The High Cost of Typewriters—The Reason and The Remedy." The coupon below mailed today will bring you one copy.

SAVE $51

This Oliver Nine is a twenty-year development. It is the finest, costliest, most successful typewriter we ever built. It is yours for 10 cents per day in monthly payments of $3.00. Everyone can own a typewriter now. Will any sane person ever again pay $100 for a standard typewriter when the Standard Visible Oliver Nine sells for $49?

Send today for your copy of our book and further details. You'll be surprised.

Over 600,000 Sold

MAIL TODAY

FREE TRIAL

No Money Down—No C. O. D.

After you read our book you may ask for an Oliver for five days free trial. Be your own salesman. Save yourself $51. You decide in the privacy of your own office or home, as you use the Oliver. Then if you want to own an Oliver you may pay at the rate of 10 cents per day.

Mail the coupon now for "The High Cost of Typewriters—The Reason and The Remedy." It rips off the mask. Cut the coupon out now.

Frost Fighting Equipment Demonstration

The Test of Orchard Heaters Made at Pomona in Most Intense Heat Ever Given to California. Committee Appointed by Chamber of Commerce Makes Report on Heaters Exhibited. See Photos of Pomona Test on Cover.

WHEN the Pomona frost fighting equipment demonstration was scheduled the commitee appointed by the chamber of commerce had no idea that it would be compelled to make its test in the most intense heat ever given to the state. This heat made impossible determination as to the heating power of the different appliances. We have no comment regarding the various heaters tested other than to give the report of the committee which made observations.

Notwithstanding California has been fighting frost for more than a quarter of a century, the equipment is still far from perfect. Since 1913, when the severe freeze came, frost fighting has been general. Those who were prepared to combat the cold of that year made thousands—it is almost safe to say millions—because of their forethought. The sucess of frost fighting is now unquestioned, but two factors have still to be considered. One is the economical side, the other has to do with the smoke nuisance, which causes inconvenience and even severe financial loss, hence the Pomona test to learn as to the smokeless heater and to learn as to the heater which could be installed and still leave a reasonable profit for the grower. The smokeless feature is practically solved. The economical side of the question has been complicated more than ever by the enormous increase in prices of steel and fuel. As Mr. Adamson says in his article below. there are serious problems before the grower but he will solve them.

* * *

The report of the committee follows:

In compliance with your request the undersigned committee, appointed by you to conduct a test of orchard heating appliances, has made such tests and begs to report as follows:

The comittee nominated by you consisted of the following members: E. T. Sederholm, chairman, Willis S. Jones, J. E. Adamson, A. F. Norcross, O. H. Hottel. Of these, Messrs. Jones and Adamson were unable to attend, so that the tests had to be conducted by the other three members on the nights set by you, June 12, 13 and 14, 1917.

The following heating appliances were entered for demonstration: Wizard heater, by G. L. Blanchard; steam oil burner, by Boley & Fairall; stack attachment, by J. P. Simpson; stack attachment, by Eclipse Patent Agency, exhibited by Mr. Kodima; glass orchard heating system, by D. R. Glass, exhibited by C. W. Hibbard and J. B. Vaile; kerosene orchard heater, by Klunk & Wheeler; blue-flame kerosene heater, by W. W. Crosby. This last named heater was exhibited only on the last night of the tests and for too short a time for the committee to form an idea of its merits.

Of the above heaters the Wizard, the Simpson, the Glass and the Klunk & Wheeler were exhibited in an orange grove, each heater placed in the middle between four trees. All the other heaters were exhibited on the grounds of the adjoining San Antonio public school, where also several Simpson and Klunk & Wheeler heaters were exhibited.

All the pots, except as later stated, burned ordinary smudge oil of about 27 degrees gravity, all taken from the same tank. Mr. Glass stated that he could just as well, if not rather, have burned crude oil, or any heavy oil. The Klunk & Wheeler heater and the Crosby heater both burned kerosene and are not adapted to burn heavy oil.

The committee considered that it would be of no value to make any thermometer tests, owing to the very warm weather that prevailed during the tests. However, in order to make sure as to this point, as well as in order to know positively whether or not any trees had been overheated, one such trial was made, and that with the pot which gave by far the greatest amount of heat of any of those burning in the orange grove. This was the Glass heater, and two of these were installed. Thermometer readings were taken at five points with thermometers that were compared with each other immediately before the test. No. 1 was placed outside the heated area, to windward; No. 2, about two feet above ground, at the nearest tree, facing the heater; No. 3, about 1½ feet above ground, on a tree adjoining the second heater, but so as to face the next empty middle where there was no heater. It was in direct line, however, with any such air currents as could be expected on a cold night. No. 4 was placed 4½ feet above ground in tree nearest to leeward of second heater and facing same. No. 5 was placed directly below No. 4, and about 1½ feet above ground. Readings were, of course, taken simultaneously, as nearly as possible. Thermometer No. 4 gave the greatest rise in temperature, but only 5 degrees Fahrenheit. The heater was going full blast and gave off an unusual amount of heat. On a cold night, where draft conditions would be entirely different, the result would undoubtedly also have been different, and we mention this especially so that no one may think that this heater is not capable of producing a great amount of heating effect. It simply proved our contention that thermometer tests under the circumstances were out of the question. It also proved that no damage could by any possibility be done to the trees.

The committee, therefore, had to

Genuine Warmth

Forest and Field Fires Unite with Old Sol to Give to Coast Sections South of San Luis Obispo an Unprecedented Visitation of Heat

DARKLY pessimistic views of the heat wave which prevailed for a few days after its greatest intensity—Sunday, June 17th—have given way to a more hopeful feeling. The lemon grower who at first estimated his loss to be at least 80 per cent of the fruit on the tree now estimates that a much higher percentage will be marketable. Some lemons of nearly picking size were actually cooked and the tissue immediately broken down. Others had when cut much the same appearance as frosted lemons. Valencias were softened so that picking ceased for several days. They are now returning to normal condition and shipping is resumed. Walnuts suffered greatly, a large number most exposed to the afternoon heat being burned so that they dropped from the trees. The more protected nuts, however, are yet apparently all right, and it is estimated that at least 75 per cent of the crop will be marketed.

An interview with walnut, lemon and orange growers through the San Gabriel Valley, San Dimas, Pomona and Ontario sections, and later in Riverside, Corona and Orange County sections, shows somewhat diverse opinions, almost everyone saying it is yet too early to determine actual loss.

But with the loss there are some compensations. For instance, one very large orchard company reports that the heat has wiped out practically all black scale from its trees.

The lemon injury is far less serious than would appear at first thought. Nine-tenths of the lemon crop for the season has been harvested. Of that remaining on the tree, the later fall picking, which usually commands good prices, will yet be marketed. It was feared at first that these under half-sized lemons would drop from the tree, but the drop has proved much less serious than at first anticipated, and, unlike the full grown lemon, the young fruit seems to show less breaking down of the tissue and less injury.

Navel oranges in orchards on very light, sandy soils, and which possibly were suffering for moisture, have shown very severe dropping. Others, especially where well irrigated shortly before the heat, are yet carrying the greater proportion of their crop. Young fruit of Valencias, that is the crop for next year, shows much less effect of heat than does the navel.

As to the walnut crop, very thorough canvass of the situation has been made by the California Walnut Growers' Association, and the following notice is being sent to the trade:

"Southern California has experienced the hottest spell of weather reported for 40 odd years. During the period from June 14 to 17, inclusive, temperatures ranged from 111 to 123 degrees in the shade in the principal walnut producing districts. This freakish spell caught the walnuts at a very tender stage before the shells had hardened and simply cooked a large percentage of them. We have just completed a very thorough investigation of the damage with the following results: Santa Barbara County 5 per cent damage, Ventura County 20, Los Angeles County 25, Orange County 35.

"As the largest productions are in Orange and Los Angeles Counties the average damage for the entire crop is close to 25 per cent, but as we had a prospect for the greatest production on record we will still apparently ship about as many walnuts as were marketed last year.

"We are aware that many reports have been circulated to the effect that the walnut crop was much more seriously damaged than is indicated by our estimate. However, we believe that the higher estimates of damage are not based on any systematic investigation. We feel confident, therefore, that our prediction of the damage will prove sufficiently high and that it is as accurate as it is possible to obtain.

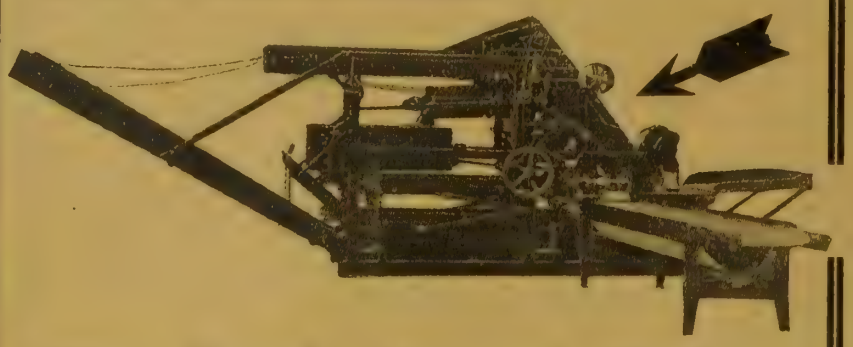
"Apparently all of the nuts that are badly burned will prematurely drop from the trees. There are perhaps from seven to ten per cent of the nuts which show no outward appearance of damage but still are so badly cooked that the kernels have turned black and are drying up. These will probably also prematurely drop, but if they do not, as the kernels will be badly shrivelled and light weight, they will be removed from the merchantable walnuts by our suction machines. Thus at this time we see no reason why the quality of Diamond Brand walnuts should not be at least equal to the 1916 deliveries."

Small Crops

Strawberries and other small fruits suffered from injury to ripening fruit, but young fruit is now coming on and the market is abundantly supplied. Potatoes and beans lacking in moisture at the root suffered, but the great bulk of the crop is in fine condition.

Mr. Almond Grower

You can reduce the cost of your own hulling fully 80 per cent, and hull your neighbors' almonds at a profit of $20.00 per ton with this wonderful machine.



The Read Almond Huller and Separator

will hull and separate almonds—quick and clean—at a cost of only $5.00 A TON.

The hand method costs from $25 to $32 a ton.

No wonder one owner says, "It would be impossible to do without it."

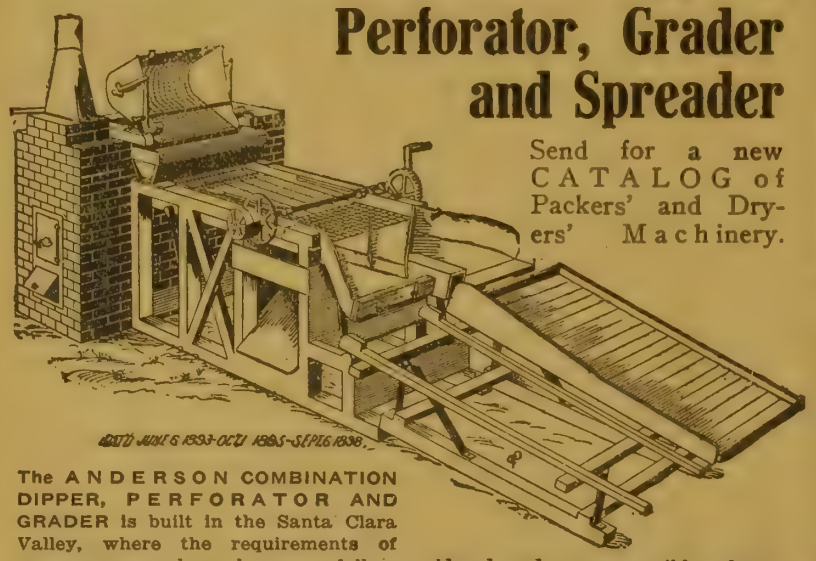
Let us send you our literature describing it, and telling what other owners say about it. Would ask that you get your order in early, so that you will not be disappointed in delivery, as we are behind in filling orders in all our departments, and will be for some time to come.

Write now while you think of it. Address,

Schmeiser Manufacturing Co.

22 Mechanic Street Davis, California

Anderson Combination Dipper, Perforator, Grader and Spreader



Send for a new CATALOG of Packers' and Dryers' Machinery.

The ANDERSON COMBINATION DIPPER, PERFORATOR AND GRADER is built in the Santa Clara Valley, where the requirements of prune growers have been carefully considered and every possible advantage incorporated into the machine. Can be furnished with or without rinse tank. Made in various sizes for hand or power.

SEND FOR 1917 CATALOG.

It illustrates and describes the entire Anderson-Barngrover line of Fruit Packers and Dryers' Machinery. A copy will be sent free to all who are interested. A postcard will bring it.

Anderson-Barngrover Manufacturing Co.

30 West Julian St. - SAN JOSE, CAL.

Perforated Tree Protector

That will keep Squirrels, Rabbits and Gophers from barking your trees and give perfect protection from hot sun, sandstorms, barking in cultivation, etc. Tell us your pest and we will tell you what kind of a wrap to use. We make a number of kinds and can save every tree for you from pests.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, never disturbing your plant nor stopping its growth in transplanting a single hour.

For starting early vegetables, such as Tomatoes, Cabbage, Eggplant, Cauliflower, Cucumbers, Cantaloupes and Squash; also for propagating Rose Cuttings, Geraniums, Eucalyptus and Conifers. It's the only practical pot on the market today for propagating work. Write us for samples of either Pots or Protectors. Tell us which you are interested in.

"Peach Growers" Has Successful Year

THE California Peach Growers, Inc., is closing its first year most satisfactorily to the members. The members will receive nearly six cents per pound for this year's pack, and investors in its $847,165 worth of stock will receive 7 per cent on the money invested.

The old board and former officers were re-elected. They are F. H. Wilson, president; J. F. Niswander, vice-president and general manager, and Al Sunderland, secretary-treasurer. W. J. Wilson, John C. Rorden, Warren A. Woods and A. L. Sayre are the directors.

The trustees have sent out the following letter to members:

"We take pleasure in announcing that the crop of peaches handled by this company during the past year will net the grower an average of approximately six cents, meaning that there is yet one cent per pound to be distributed in accordance with the grade-out of the various crops of the individual growers. Please advise the growers in your district that just as soon as possible (and within 60 days) there will be mailed to each of them a complete statement of peaches delivered to this company, with percentages of grades, together with a check for the balance due. The final payment will be based upon grades, and the amount each individual grower will receive will depend entirely upon the size of the peaches delivered by him. There are those who will receive less than one cent per pound additional; others will receive more than one cent.

"It is also very gratifying to your directorate to announce that a dividend of seven per cent will be declared to each subscriber of record. This dividend will very shortly be distributed to such subscribers as have settled in full with this company for their stock. The dividend of any stockholder who has not paid in full for his subscription will be credited to his account.

"A number of growers delivered to this company, through the 'Rorden Pool,' their holdings of 1915 crop peaches, upon which they have received a payment of five cents per pound. These goods have been sold, with the result that approximately one-fourth of a cent per pound will be paid as a final settlement.

"With the closing of our records for the first fiscal year ending May 31, 1917, every detail of the past season's work has been checked and completely audited."

Quality First

However much we may believe in the expansion of the olive business in the future, and the probable extension of the eating of olives to the masses of the people of this and other countries in this hemisphere, it is undoubted that this article will not soon come to be regarded as a necessary part of the daily diet of the average person, or, in other words, a staple like bread or meat. For a good many years to come the ripe olive, because of limitations placed on its finished production in the way of cost, will remain beyond the means of the wage-earning class to purchase except as an occasional luxury or indulgence. And however much we would like to see every person in this country using olives as they do other staple articles of food, knowing well the benefits that would follow such a practice, both to producer and consumer, we cannot proceed on any theory at this time except that the ripe olive of this country is a delicacy, is bought as a delicacy, and will continue for many years to be sold for such use only.

Now, as everyone knows, an article falling naturally in this class, and perforce making its appeal to a limited buying public possessed of the means

to indulge its tastes, must take a different course in selling methods from those applying to canned tomatoes, for instance. Since we cannot, under present conditions of relatively high cost of production, reach the masses with our product, we should, it seems to us, do what we can to set and maintain a high standard of quality that will justify among the trade we have the necessary prices that we are now obliged to ask. Of course, it will be understood that we are now referring t good olives put out by responsible firms and not taking into account the stuff that passes for edible fruit and which we unfortunately find with too much frequency in our larger cities—a mixed assortment of undersized, poorly colored, carelessly processed junk that is a libel on the legitimate olive business. —Olive Journal.

GRAPE PRICES

Regarding prices of labor in Central California we have heard that raisin and other growers are more liberal than ever. We note in the Dinuba Sentinel:

"In order to meet the desires of large labor contractors throughout the state the managing and executive committees of the Valley Fruit Growers Association met Monday, June 18, at their offices, 1840 Kern Street, Fresno, to name rates of wages and contract prices to be paid for harvest work during the ensuing season.

"The rates fixed were as follows (basis average crop):

For Raisin Grapes

"Muscats, 3c per tray of 22 pounds of grapes.

"Thompsons, 2½c per tray of 22 pounds of grapes.

"Sultanas, 2½c per tray of 22 pounds of grapes.

"Contracts for picking, curing and boxing:

"Muscats, $17.50 per ton of raisins.

"Thompsons, $14 per ton of raisins.

"Sultanas, $14 per ton of raisins.

"Wine grapes: Picking in boxes, $2 per ton.

"Peaches: Cutting, 6c per box.

"Day work during harvesting period: Month of August, 27½c per hour; month of September, 30c per hour.

"In fixing the above schedule of wages the Valley Fruit Growers' Association was actuated by a desire to fix prices considerably higher than have been obtained in the past, although the result of inquiries throughout the entire state demonstrates that in four counties of Tulare, Fresno, Kings and Madera, represented in this association, a very considerably higher rate of wages has obtained than has been paid in any portion of the state for like work, all of which goes to prove that this association aims not only to be just to the laborer who does farm work, but to be generous.

"The attorneys of the association have in preparation a form of contract to be used by all of its members, and which will deal with the various classes of work to be performed, and its members are requested to await the receipt of these blank forms of contract before formally signing agreements for the ensuing season."

MORE PEACHES

Sales Manager Sturtevant of the California Peach Growers finds on closing the season that a few cars of last season's peaches are on hand and is offering the trade regular stock and some fancy peeled at list made on May 15.

CARVER LECTURES

The University of Southern California announces a course of lectures by Dr. Thomas Nixon Carver of the United States Department of Agriculture. Dr. Carver was at one time professor of political economy in the institution from which he graduated. He later went to Harvard University and from there was drawn into the service of the government. Dr. Carver's addresses in Los Angeles will be on the subject of principles of rural economics and the theory of social progress. The lectures begin at 10 o'clock on Monday, July 2 and continue daily till August 10.

Book Review

MANUAL OF FRUIT DISEASES

"Manual of Fruit Diseases," by Lex R. Hesler, assistant professor of plant pathology, New York state college of agriculture at Cornell, and H. H. Whetzel, professor of plant pathology, same institution, published by the Macmillan Company, New York, at $2.00.

There are 462 pages of information for every fruit grower in this book. As it states in the preface; "It has been estimated that 75 per cent of fruit growers' losses may be prevented by spraying, the chief method of fruit disease control.

"In order to understand and to perform properly the measures of fruit disease control, it is essential that some knowledge of the cause of the disease in hand be acquired. In recent years scientists and laymen alike have recognized the importance of certain technical details regarding the cause in order to undertake the prevention of these losses. Similarly, the value of other facts must be apprehended, such as the history of a disease, where it originated, with what rapidity the pathogene has spread, the losses it is capable of incurring, and under what conditions these destructive outbreaks (epiphytotics) occur."

There are 16 chapters and an appendix. No pages are wasted on introductory talk, Chapter I beginning immediately with apple diseases, this chapter and Chapter II requiring 151 pages to discuss troubles, symptoms and treatment.

Chapter III touches upon apricot diseases, IV upon the blackberry and its troubles; others on the diseases of the cherry, cranberry, currant, gooseberry, grape, peach, pear, plum, quince, raspberry, strawberry, and the last chapter and the appendix treat of fungicides, books and journals on fruit diseases, glossary, etc. It is a good book for every grower of fruits.

Boy Scouts of Lodi are planting city lots to beans.

-help balance the nation's hay shortage by planting Sudan Hay now!

YOUR COUNTRY NEEDS HAY

Sufficient Egyptian corn and milo maize have been planted to more than meet the demand—reports indicate a *shortage of hay*. Sudan grass is the hay crop that will make REAL MONEY for you.

If you plant now under the present warm and favorable conditions, you should have a crop five to six feet high (ready to cut) in 40 to 60 days. Subsequent cuttings mature in 35 to 40 days.

The University of California bulletin says, "Sudan grass is good to look at, is easy to grow and handle, grows during the summer, gives large yield and is well liked by stock. It maintains growth throughout the season under arid conditions. It grows so tall and thick that weeds have no chance to grow. *With* irrigation it will produce eight to ten tons per acre—without irrigation, up to four tons to the acre. Grows in a wide range of soils—from sand to clay."

SHOWING 68 DAYS GROWTH OF SUDAN GRASS MADE AT TRIAL GROUNDS OF GERMAIN SEED & PLANT CO.

Sudan Grass Beats Them All!

This table from the University of California State Bulletin shows yield of constituents in pounds per acre from grass hays:

Kind of hay	Yield per Acre	Dry matter	Protein	Fat	Crude Fiber	Nitrogen free extract	Ash
Sudan Grass	8,640	6,367.7	439.4	191.0	1,794.6	3,485.2	457.8
Barley Hay	4,000	3,400.0	350.2	95.2	996.0	1,792.0	166.6
Rye Grass	4,000	3,520.0	369.6	123.2	969.0	1,735.5	323.5
Timothy	4,000	3,316.0	225.5	96.2	1,107.5	1,721.0	165.8

Reports indicate an overproduction of corn and a shortage of hay this year.
Our free Sudan Grass folder explains the wonderful features of this great forage crop. Write or call for it.
Better place your order for seed at once in order to insure early delivery.

Special Summer Prices

36 cents per single pound, enough for 50x100 ft.
10 pound lots, 34 cents a pound, will plant an acre (sown broadcast.)
25 pound lots, 32 cents a pound.
100 pound lots, 28 cents lb.

FROST FIGTING EXPERIMENT

Continued from Page 707

content itself with testing such points only as could be observed in other ways, and depended on personal judgment. All the members have had considerable experience with orchard heaters under actual field conditions during a frost, and yet they have thought it unjust to attempt to rate these heaters in order of merit, and that fairness demands that they confine themselves only to a recital of facts as they found them.

Wizard Heater

This consists essentially of a cast-iron retort, in two pieces, placed in a smudge pot punched full of holes. The oil is dripped into this retort through a small pipe and vaporized. It burns in the smudge pot in the form of gas and continues to burn all the way up the stack, which is also punched full of holes. Old smudge pots can be used as well as new, for they need, of course, not be tight at all.

During the first night this heater made about as much smoke as an ordinary smudge pot as generally burned. It gave off a good deal of heat, probably more than the average heater would be expected to give. The second night Mr. Blanchard had made some alterations which had materially lessened the smoke without in any way lessening the heat, and the third night some further changes had still further improved it, so that the flame burned fairly clear. It appears, however, that the heater is still entirely in the development stage and needs to be further improved before it can be classed as smokeless. Its present cost is approximately $1.75 per heater.

Steam Oil Burner

The elements of this heater are a tank or boiler for the water and steam, another tank for oil, a burner for atomizing the oil, a fire pot and a pipe coil in the fire pot, in which the steam is made. The steam is conducted to the upper end of the boiler and the coil is fed with water from the lower end of the same boiler or tank. The steam is then piped to the burner, where it atomizes the oil and blows it into the fire pot or combustion chamber. The steam pressure is regulated by means of a small lever safety valve, and varied to change the intensity of the fire by sliding the weight along the lever; 1½ to 6 pounds pressure is maintained.

This heater requires several minutes time to light up, but burns well afterward. It is perfectly smokeless and gave by far the greatest heating effect of any heater tested. This heat was in fact so intense that it is a question whether it would not be too much for the trees if the heater would be placed in a grove. On the windward border it would certainly be able to temper the air before it ever enters the grove at all. It can be burned less intensely, but it is a question whether it would pay to do it on account of its considerable cost, which was stated to be between $10 and $12 per unit.

Simpson's Stack Attachment

Mr. Simpson exhibited a stack which can be used on practically any make of smudge pot, and which serves to gasify the oil so as to burn it with a minimum of smoke. He exhibited pots of most of the leading makers and they all gave good results where the pots were in good order. Some had stacks five inches in diameter and others six inches in diameter. Some stacks were fitted to the Simpson rectangular pot, which was unusually air tight, owing to having its cover riveted on, as well as on account of good workmanship.

The Simpson stacks all lighted up with the greatest ease. Out of 43 pots lighted the last night all but three started right away and remained burning. The other three also started to burn, but went out later, and two of them could not be made to burn satisfactorily at all, owing, apparently, to a defect in these particular pots. Towards the end of the test two of the other pots were put out through explosions caused by water in the oil. Other pots also showed evidence of the presence of water. All of his pots burned with only very little smoke, probably not over five per cent of what would be found with ordinary smudge pots. The stacks are high, and it was shown that the gases of combustion rose straight in the air for a height of some 30 to 40 feet. At the same time the pots, which burned approximately at the rate of a half gallon per hour, gave off a good deal of heat. The price is $1 for a five-inch stack and $1.25 for a six-inch stack.

Eclipse Stack

To outside appearance as well as application this is similar to the Simpson stack. Like the latter it was fitted to several different makes of smudge pots, and it also is one of the high stacks. On the last night the committee lighted the 16 pots of this make, all with five-inch stacks, and had considerable difficulty in getting them to burn. Only very few started right away. Several were kindled again and again, as many as from six to nine times, without success, and left smoldering until the rest were lighted and until the Simpson stacks were started. On returning to the Eclipse stacks the committee found eight of them out, and tried again, partly succeeding with a few, but failing with several. Of those that burned all burned well, giving off about the same amount of heat as the Simpson five-inch stacks, as near as could be judged, and with but very little smoke. In this respect there did not seem to be much choice between the two makes, and both were very free from smoke. The cost of this stack was given as being 75 cents, but the committee was informed that improvements were under way, and it is possible that they may change the price.

Glass Orchard Heating System

This system aims not only at doing away with all smoke, but also with the labor of filling the heaters. It consists of a central oil tank, one for the whole orchard, a power driven air compressor, or rather blower, an oil pipe system and an air pipe system, both placed under ground and both leading to the burners and smudge pots. Each burner is made up of pipe fittings, one end of a small ell connecting the oil system, the other end connected to the air system. The atomized oil issues through

Students, Machine Shops---Polytechnic College of Engineering

THIRTEENTH AND MADISON STREETS, OAKLAND, CALIFORNIA

One of the Best Equipped Schools in the United States

Immediate Employment at Excellent Salaries for All Who Qualify.

Join the Industrial Army Now

A MACHINIST IN SIX MONTHS

Why serve four years as apprentice learning the machinist's trade when you can learn to be a journeyman-mechanic in six months at the Polytechnic College and receive a minimum wage of four dollars a day to begin with This is the record of many of our students and it is being demonstrated every day.

TIME IS MONEY. Don't waste three and one-half years of time "sweeping out" or doing some one thing six months or a year that can be learned in a week. The Polytechnic Shops are run on a Commercial basis. Contracts for construction work are taken and students are advanced as fast as they master the successive steps in shop practice.

MECHANICS IN DEMAND

Throughout the Country, and especially in California, the demand for mechanics and mechanical engineers is pressing. Every machine shop is running full capacity and "MORE men wanted" is the cry everywhere. There is no excuse for idleness if one is qualified. The great industrial army now in service must be increased by thousands of new recruits. But they must have the proper training. They must KNOW how to do the things that MUST be done. Actual practice on the most practical kind of mechanical construction is the daily program at the Polytechnic College. Seeing is believing. Visit the College and see for yourself and then decide to take advantage of the opportunity.

Many of the leading firms in Oakland have mechanical work done at the Polytechnic Shops. Many outside machine shops have special work done at the College Shops where the facilities for handling all classes of machine work are complete. The College is open all summer and students admitted at any time. A descriptive catalog will be sent free to anyone upon request.

YOUR Opportunity

The Greatest and Most Wonderful Home Furnishing Opportunity You Have Ever Had Presented to You Is Now Here In

BARKER BROS. GREAT ANNUAL SALE OF FURNITURE AND HOME FURNISHINGS

—More than $1,250,000.00 worth of Dependable Home Furnishing Merchandise Embracing Almost Every Department and Nearly Every Line In Our Immense and Complete Stock.

—Your Chance to Get Up to Half as Much Again, and in Many Cases Even More, For Every Dollar You Invest.

Out-of-town home furnishers may take advantage of this sale through our MAIL ORDER DEPT. who will pick for you the very best values and make your buying as satisfactory as if you visited our store in person.

REMEMBER,—We Pay the Freight 250 Miles on any Shipment and Make Liberal Allowance for Greater Distances.

IMPORTANT—Send for our 48-page Book of Draperies, Floor Coverings, Etc. A Post Card Request Will Bring It To You Promptly Without Cost.

AMERICAN BEAUTY DUST SPRAYERS

PROTECT

"A Puff in Time Saves the Vine"

For a big bean crop, rid your fields of red spider, mildew, rust, etc. The American Beauty sulphurs rapidly and effectively, distributes evenly, and saves time, money, and material.

Guard your citrus groves with this powerful knapsack sprayer.

For corn ear-worm (boll-worm), square-borer, boll-weevil—for various pests attacking cotton, tobacco, and garden crops, the American Beauty dust sprayer is indispensable.

Ask your dealer, or send us $16.00 for standard size—$13.50 for junior.

All charges paid—trial offer.

We Fully Guarantee Every Machine

THE CALIFORNIA SPRAYER CO.

6029 Pasadena Ave., Los Angeles, Cal.

a narrow slot and is sprayed far enough away to leave the nozzle cool. It is burned in a sheet iron furnace with a rather wide hood on top, which has a tendency to spread the heated air out near the ground.

This spreading effect was explained to the committee, but could not be demonstrated on account of the high temperature of the surrounding air, which prevented all similar effect on all the heaters. It was evident, however, that the general heating effect of this heater is considerable, and the sheet metal was heated to a red heat. The combustion was perfectly smokeless, and is said to be equally smokeless even with still lower grade oil than was used.

The makers were not in position to give the exact cost. They stated, however, that the oil pipe need be of but small dimensions. The air pipe has to be comparatively large, and under present conditions of the market it is impossible to say from day to day what the cost will actually be. The approximate figure given was from $300 to $350 per acre, installed, figuring 25 heaters to the acre, which is what the makers advise. This is approximately one heater to each four trees. They also state that the air compressor requires about one horsepower per acre, although they say it is best to figure on 1½ horsepower. The fuel consumption during the test was exactly a half gallon per hour per heater. Air pressure is said to have to be only six ounces at burner.

Klunk & Wheeler's Kerosene Heater

This heater consisted of a one-gallon tank for kerosene, elevated to a height of about four feet and piped to the vaporizer and burner placed immediately below. The vaporized consisted essentially of a small ring-shaped tube, with a small aperture on the inside of the top. It was placed in a smudge pot and surrounded by its own flame. It was easy and quick to light, but took a little longer to burn freely. Then its flame was perfectly clear and smokeless, and it appeared to give off a very considerable amount of heat, as near as could be judged practically as much as the average five-gallon smudge pot. The fuel consumption was very small and amounted to 0.107, 0.121, 0.114 and 0.123 gallons per hour, respectively, for the four different heaters. This amount is so small as to offset the extra cost of the higher grade fuel required, and it goes without saying that the less fuel needed the less is also the labor of filling after a frost night. The committee also thought that almost, if not qurte, as good heating effect could be had when burning without any fire pot whatever. That is not the way the makers recommend, but they expect that old smudge pots would be used for fire pots. They state that the present cost of each unit is $1.30.

Crosby Blue Flame Heater

For reasons already stated we are not in position to say anything about this heater, beyond stating the fact that it burned with a clear blue flame, free from smoke.

In conclusion we wish to state that the price for the Wizard heater, as for the steam oil burner and the Glass heater, in every case is for a complete heater. The Glass heater is even installed by the makers. All other prices contemplate the use of existing smudge pots, and where they are not to be found the price would, of course, be increased accordingly. In every case there would anyway be some expense attached to adapting the old pots to the new system.

We would further say that we have emphasized the smokelessness wherever we found it, without, therefore, wishing to go on record as saying that it would be at all safe to do away with all smoke. On this point the committee is divided, the chairman and Mr. Norcross holding that in very cold weather, where, in spite of all heating, some freezing might and will take place, a cloud of smoke may still save the fruit by holding off the sun's rays in the morning until the fruit has gradually warmed. The third member considers this point one of less importance and prefers perfectly smokeless heaters. This is, of course, not a point that we were to consider, but the committee wishes to mention it so that a wrong construction may not be placed on the often repeated remarks as to this or that heater being perfectly smokeless.

Respectfully submitted this 23rd day of June, 1917.—G. T. Henderson, H. F. Norcross, O. H. Hottel.

DOES IT PAY?

Written for California Cultivator
By J. E. Adamson

THERE seems little if anything to say about the prospects of the frost fighting campaign for the coming winter.

If the loss from the extreme heat is as serious as reported the only work done will be on lemons or to save the trees in case very low temperatures are reached.

As to the agitation for smokeless heaters, there is no new discovery in this line, simply new adaptations of the same old principle in making heat from the combustion of hydrogen, carbon and oxygen. Given the right proportions and the combustion is perfect, but vary the proportions ever so little and there appears more or less smoke. This immutable law is the stumbling block of the inventor of heaters. The demands of the grower for a variable fire to suit the weather and the varying level of the oil in the heater are not to be satisfied with a one-size fire, and when a change is made perfect combustion is lost. This can be proved by the simple experiment of turning the wick of a high-grade oil lamp too high for the set of conditions given in the chimney and burner, when you will have a real smudge-pot.

There is little or no interest in the question of new heaters at this time for the reason that the high cost of steel and labor make the price prohibitive, and it is safe to predict very small if any purchases of new equipment this season .

The most probable move in this district will be the use of the block or check-line system of early firing in an effort to reduce the cost of the campaign and also to hold down the total smoke. This system would allow for the better dissipation of the smoke in the atmosphere and do away with the excessive carbon-laden smoke of the present system.

The California state fair has changed its plan of sending premium lists, and this year sends a separate list for each class. This will make a material saving in that poultry or live stock people are often but little interested in lists of premiums for fancy work or other features of a state fair. The first to be received is the list of the poultry, pigeon and pet stock show. Entries in this class close August 25. E. F. Mitchell is director of this division of the fair. Write Secretary Paine at Sacramento for lists.

TEAGUE QUALITY
CITRUS TREES

AWARDED THE GOLD MEDAL AT FOUR INTERNATIONAL EXPOSITIONS.

For Productive values, fine quality of fruit and vigorous growth Teagues bud-selected, (pedigreed) properly trained and carefully handled orange and lemon, pomelo and lime trees are the trees to plant. An experienced covering a third of a century warrants the assertion that **Teague Quality Citrus Trees** possess these qualifications in a superlative degree. All the standard commercial sorts, and garden and ornamental varieties; the largest assortment of citrus trees in America. . . . We invite correspondence from intending planters. . . Consultations on citrus planting by appointment. . . Prices cheerfully furnished.

Citrus Growers Insurance

Did you know that for a very small investment a $1000 life insurance policy could be carried that not only is a protection to that amount but under the policies written by The Great Republic Life Insurance Company,

Three Additional Benefits

are possible.

In case of ACCIDENTAL DEATH the Company will pay DOUBLE the amount of the policy.

In case of TOTAL or PERMANENT DISABILITY the Company will assume the burden of keeping the policy alive.

In case of ACCIDENTAL DEATH OF THE BENEFICIARY the policy holder will receive the full amount of his policy.

And one of the most important provisions running through all our policy forms is that providing for LOAN INSURANCE. Many property owners who have money borrowed on real estate take out one of our policies equivalent to the amount of the loan. Our policies have the highest loan value and in the preparation of this policy we have incorporated a provision authorizing ADDITIONAL TERM INSURANCE covering the indebtedness on the policy. In the case of death of the insured, the loan is cancelled and the full amount of the original policy is paid to the policy holder.

We desire to correspond with citrus growers, ranchers and cattlemen who desire Life Insurance. It will be a satisfaction to own a policy in our Company and the cost is small.

It is easy to sell Great Republic Life Policies. If you have a part or all of your time that you could devote to this work write to us for an agency.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Hale Peach Not Bearing

Have three-year-old J. H. Hale peach trees which were sprayed and pruned and put out fruit spurs, but the latter died back to the main limb. and although new branches have come out the tree is not fruiting. Would appreciate information as to proper treatment to induce fruiting another season.—Subscriber, Woodland.

As a sugestion for next year, irrigation should be continued until the fruit buds have been well formed. Too many orchardists believe in leaving the tree alone after the fruiting period is passed. Again, when leaves have all dropped the mistaken idea sometimes prevails that the tree is in no need of moisture at the roots, and in such seasons dearth of rain may cause trees to suffer. There should be sufficient moisture at all times in the ground. Regarding the Hale peach not bearing in this state, the matter was referred to J. W. Mills, farm adviser for Solano County, and he finds that this variety does well in that section. Mr. Mills writes: "I have made inquiry in the Vacaville district in regard to the bearing of the J. H. Hale peach and find that it bears well in that locality. I do not know of any of these peaches having been planted in Suisun Valley more than two years ago. I imagine that Mr. Walber's trouble might be due to the trees having grown too thick and dense, thereby injuring the fruit spurs. However, this should not interfere with the blossom buds on the outside of the trees. His peach trees are rather young to expect much fruit. I imagine if he would see Mr. Searls, the farm adviser of Yolo County, he could give him better information, as he is there on the ground."

Squirrel Pest

Squirrels are eating up our melon vines. Have tried poison with no effect. What spray may be used successfully against this pest?—Subscriber, Lindsay.

Boys should get these pests, but safer and quicker is suffocation. Every neighborhood should unite and kill off every squirrel, for they are not only destructive to plants and even trees, but are a menace to life. Good work has been done by attaching a large hose to the exhaust pipe of an automobile and pumping the smoke or consumed gas down into the hole and closing immediately. There has also been constructed, according to plans drawn by the United States department of agriculture, an instrument called the squirrel destructor, which pumps carbon bisulphide, "kilmol," or similar deadly gas into the holes. Balls of waste cotton may be saturated with either of these substances and dropped into the hole and most effective work done. Be sure that the holes are filled with dirt and covered tightly after the gas has been released in the holes. More effective work along this line is accomplished in the rainy season, for then the ground is not so porous and the deadly gases are retained a longer time.

Pendulous Crop

Have hatched several hundred turkeys and have had very few die. I feed very simply; sour milk, rolled oats and alfalfa range, with, of course, grit and water. When they "sport the red," add cracked milo maize. The results have been splendid so far. Now, some that are two months or so old are showing pendulous crops, two or three very marked and many others with a tendency toward it. They have been hand raised and do not like the range. Our range is large, with good shade, scattered alfalfa and weeds, but few bugs, so we feed grain and milk. Weather has been very hot, so that milk quickly sours with much whey. Unless we feed they seem very hungry.

Feathers are unhealthy looking. When emptying crops the contents seem to be whey alone, yet we like to continue the sour milk, for we attribute our freedom from bowel trouble to the lactic acid. In hanging the crops do not look stiff like those stuffed with grain, but loose and baggy. The marked symptoms have occurred since the extreme heat and since the milk has become whey so quickly. Can it be the whey is at fault?—Subscriber, Brawley.

The whey itself ought not to have an injurious effect if fed in moderation, but if the poults have been allowed to fill their crops with it to the exclusion of other food it might easily produce a baggy crop. At the Rhode Island station, beginning when the poults are about three weeks old, they are given a quart of sour milk morning and night for 35 to 40 poults, and this amount is gradually increased. I notice your poults are getting no hard grain the first three months and no green except what they get from the alfalfa range, so it is more than likely the whey has formed too large a proportion of their ration. A little chick feed, cracked wheat or broken rice should be mixed with the oats once a day or fed separately if more convenient, and they should have some chopped green, especially onions, every day to make sure that they are getting all the greens they require. It would be a good plan when the milk sours so quickly to make a part of it, at least, into cottage cheese. Set the pan on the stove and let the milk just warm through, then drain through cheesecloth. In this way you get rid of the whey, which contains very litle nourishment, and have left a protein feed of great value. The cottage cheese may be mixed with the rolled oats and chopped greens or fed alone in place of the sour milk. Half a teaspoon for each bird twice a day would be an ample allowance. You are quite right in not trusting your birds to get all their food from the range, but should guard just as carefully against feeding them too much at this critical age. They ought to get the equivalent of the noon meal for themselves, but have a light feed in the morning and a sufficient amount at night to make the crop firm but not stuffed. You can tell by feeling the crops when they come for their supper how much they need.—J. A. K.

Sulphuring Fruit

Please give further advice regarding the sulphuring of fruit. Some apricots which I put out yesterday smell and taste so much of the sulphur that I am afraid to risk any more without further instructions.—Subscriber, Pheonix, Arizona.

About the only recipe there is for sulphuring fruit is the same as given in the Cultivator referred to, that is, an air-tight box is necessary and into this is placed the trays filled with fruit, the door is closed and the sulphur is lighted, often through an opening which is made underneath the sides of the box. There should be sulphur sufficient to burn from one to several hours. In drying apricots, for

instance, after cutting they are usually held in the fumes of the burning sulphur until the little "cup" from which the pit is removed has filled with the liquid drawn from the fruit by the sulphur fumes. The fact that this freshly sulphured fruit may have tasted of sulphur is no indication of its condition when drying has been completed for almost all of this sulphur is evaporated by the sun's heat.

Cucumber Beetles

Can you tell me what bug is eating the blossoms on our beans? And what would cause them? They are similar to the lady bug. Have yellow wings with 12 black spots on them. They eat the blossoms on our Kentucky Wonder and Golden Wax beans. Last year we didn't have anything but a nice lot of vines, and they are on them again this year. I have put wood ashes on them but it does not help.—Subscriber, Merced.

This is probably the 12-spotted cucumber beetle. These usually have a bright green body with yellowish head. They are about a quarter of an inch long and attack nearly everything that grows. Don't confuse these with the lady bird, which they are not in any sense. Lady birds are nearly always beneficial. These should have been taken in hand when first they appeared by feeding them on neutral lead arsenate. On beans it is probable that six pounds of lead to 100 gallons of water would not injure the plants.

Fall Potato

What is the best potato for fall planting? How about the Burbank? —Subscriber.

This inquiry was referred to H. L. Musser, who answers: "The Burbank is an old-timer and now out of the race. It used to be the favorite for June planting, but it is no longer a favorite for anything in Southern California. In the north they plant it largely, but here it is the White Rose, for early, middle and late. It is now all of 17 years since we first introduced the White Rose, and it has been gaining in popularity ever since. No other potato has held the lead so long."

Planting Sweet Potatoes

Is it too late to plant sweet potatoes? How should they be planted?—Subscriber, Pomona.

This inquiry was referred to D. F. Reichard, who answers: "Replying to your inquiry regarding the culture of sweet potatoes, would say the plants are being planted extensively at this time and can be set out until July 1. They should be planted on ridges which should be about three feet apart, the plants being set about 10 inches apart in the row. This method of planting permits of irrigation in such a manner that the water flows in the ditches made by throwing up the ridges, which is the most desirable way."

Ticks

I send bugs which I find in my chicken house. Am informed that these may be California ticks. They seem to come out only at night. Please advise method of control.—Subscriber, Visalia.

These are the common fowl ticks which are sometimes an awful pest, especially where the soil is very sandy. In "Poultry for Profit" Mrs. Koethen recommends spraying or scrubbing the poultry house with corrosive sublimate solution, eight ounces corrosive sublimate to 20 gallons water. Or one may fumigate by burning sulphur or with formaldehyde, or, still better, with cyanide such as is used in fumigating citrus trees. In the cyanide fumigation care must be exercised not to breathe the fumes, which are deadly. Keep the house tightly closed for several hours. Those who have files of the Cultivator as far back as 1910 will find in the issue of August 11 a four-column illustrated article giving suggestions for poultry house construction, which makes it possible to keep down this pest, also illustration of the pest itself. Features of control recommended in that article are as given above. The use of tanglefoot or grease barriers, which prevent the pest from reaching the roosts, is also recommended; where roosts are infested burn and substitute new ones, seek out all hiding places, etc.

Used Tin Cans

Inquiry by "Subscriber, Chula Vista," in Cultivator of June 23 is further answered by Philip M. Stone of the state university. He writes:

"In answer to your request of June 1, 1917, for information as to whether it is safe to use 'Crisco cans,' also lard pails and other tins, for canning fruits or vegetables, I am enclosing for your information a mimeograph circular on 'Hints on Food Conservation,' which contains the paragraph: 'Crisco cans and cans with smilar tops may be used for canning fruits. They should be sealed with sealing wax after sterilizing fruit in them. Do not let any available container go unfilled.'"

Keeping Potatoes

Can you tell me how to keep potatoes all the year round? I would like to keep some small ones for seed, but do not know exactly how to handle them.—Subscriber, Poway.

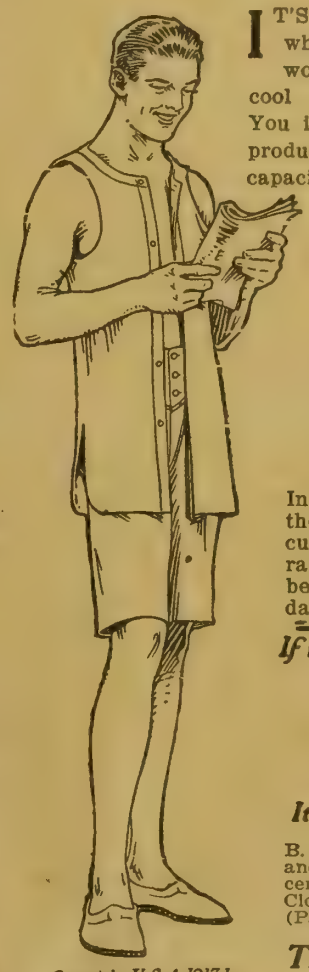
We presume the subscriber is inquiring as to the present or spring crop of potatoes. It will be impossible to keep them through until another spring planting time. If irrigation is possible, then the seed from this spring crop may be planted, say during July or early August, and this crop when it matures in the fall will have far better keeping quality than the spring-grown one. Of course where one has a cool, well ventilated cellar it might be possible to keep for some weeks, or maybe months, but would advise selling the present crop excepting such as may be needed until the fall crop may ripen.

Peach Blight

I send some ripe Alexander and green Salway peaches to learn the cause of the small "dents" in them. What treatment is recommended to prevent a recurrence of the trouble another year?—Subscriber, Lakeside.

This is a typical case of peach blight, Coryneum Beijerinckii. It takes branch, leaf and fruit and has caused millions of dollars of loss in California, and from this state has spread to many other peach sections. It is comparatively easy of control, however, if taken at the proper season, by spraying with Bordeaux mixture as soon as the trees become dormant in the fall. Prof. Ralph E. Smith, in his bulletin, refers to instances where spraying in December gave almost perfect results in the control. After December, and especially in February, results were not satisfactory. We recommend every peach grower to write the University of California and ask for Bulletin 191, the California Peach Blight, by Ralph E. Smith, assisted by E. H. Smith, T. F. Hunt and B. J. Jones. It is possible this bulletin is out of print, but if not peach growers should secure it.

Every Day's a Holiday In Cool B. V. D.



IT'S a holiday in the zest with which you go at the day's work, knowing you are cool and feeling you look it. You increase your efficiency to produce on the job and your capacity to enjoy while off it.

In our own modernly equipped Cotton Mills at Lexington, N. C., the fabric from which these Loose-Fitting B.V.D. Undergarments are made, is produced in a scientific manner from selected cotton to insure durability in wash and wear.

In our own B. V. D. Factories the garments are skilfully cut, strongly stitched, accurately finished—to fit and to be cool and comfortable all day long.

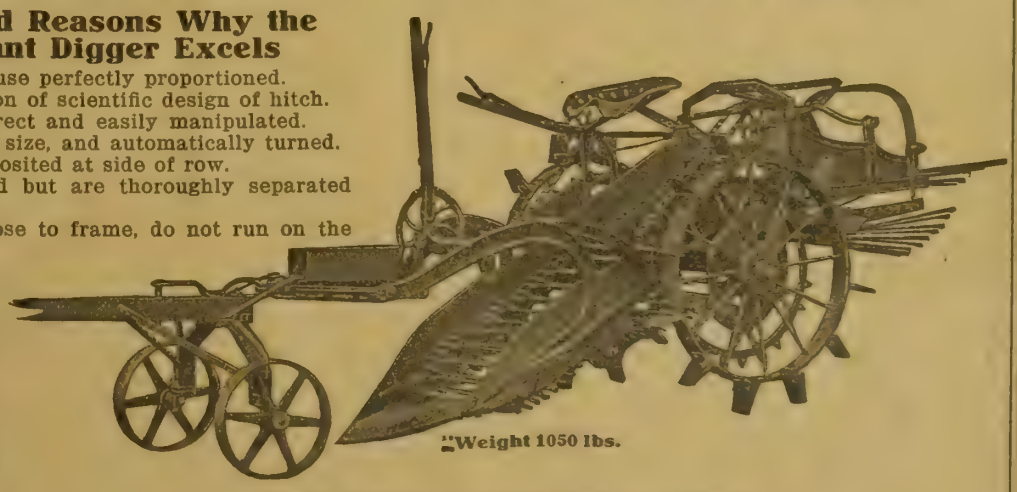
The Little Giant Potato Harvester

A Few Good Reasons Why the Little Giant Digger Excels

Great Strength because perfectly proportioned.
Light Draft, by reason of scientific design of hitch.
Leverage System direct and easily manipulated.
Truck Wheels, large size, and automatically turned.
Vines and Trash deposited at side of row.
Potatoes not bruised but are thoroughly separated from soil.
Main Wheels set close to frame, do not run on the next row.
Chain Driven, no gears to wear out.
Light Enough for Two Horses and strong enough for four horses.
Elevator Web Capacity sufficient for heaviest rows, being 22 inches wide and 6 feet long.
Main Sides of Frame are moulded in one piece to secure a rigid frame.



Weight 1050 lbs.

Cantaloupes

California is the largest grower of cantaloupes of any section in the United States. In fact, the state produces as many cants as all the rest of the United States combined. The acreage 1917 is 17,300 while last year it was 16,300. The nearest competitor is Arkansas, which plants about 6900 acres, with Georgia a close second with 6700 acres. North Carolina, Colorado and Arizona are all large producers. The bureau of crop estimates refers to California's and Arizona's production as follows:

"Personal field inspection of the cantaloupes in Imperial Valley and Salt River Valley on May 15 to 17 and May 18 to 20, respectively, by the Assistant Truck Crop Specialist and numerous interviews with growers and distributors is the basis for the following estimate:

Imperial Valley

The total area of cantaloupes to be harvested this year from Imperial County is 13,040 acres; in 1916 it was 8492 acres; and in 1915 it was 8156 acres. There has been an increase of 54 per cent for 1917 over 1916 and an increase of 4 per cent for 1916 over 1915.

In 1916 there were 4617 cars shipped making a production of .543 of a car per acre of shipping cantaloupes. In 1915 there were 4722 cars shipped making a production of .578 of a car per acre of shipping cantaloupes.

It is estimated that the stand of the plants on May 20 was 85 per cent of perfect having improved 7 per cent during the last three weeks due to the appearance of plants from hills and fields which were replanted late.

Although aphis appeared in parts of the valley, spraying was practiced, and the insects were controlled by the work of parasites before serious damage was done. The early effects of frost and cold weather have been overcome by replanting and by recovery of the slightly injured plants. Plants are making rapid growth and are well loaded with blossoms. The thrifty appearance of the vines indicates that the condition is 100 per cent as compared with a year ago.

There are good reasons to believe that the yield per acre will be equal to the yield per acre in 1916. The increased acreage has been put largely on alfalfa land which yields heavily. Records of yields indicate that late seasons yield fully as much as early seasons, popular opinion to the contrary.

The first carlot shipments from Imperial Valley have rolled on the following dates: 1914, May 15; 1915, May 25; 1916, May 16.

The first crate was shipped from the valley this year on May 18. The first movements will be light, the bulk of the crop being late, but the later plantings will mature faster than the difference in dates of planting would indicate. The season is very extraordinary and difficult to forecast, but it is predicted that more of the crop will be ready for shipment after the Arizona shipments begin than usual.

Turlock District

Cool, dry weather, frosts and severe wind storms together with other influences have affected the stand and condition of the crop to such an extent that growers became discouraged and substituted beans for a large area of the cantaloupes. This accounts for a heavy reduction in the acreage as compared with 1916.

Salt River Valley, Arizona

The stand of the plants is estimated to be 85 per cent of perfect and a thrifty appearance with vines standing to run and blossoms forming normally is the basis for an estimate for condition of 100 per cent as compared with one year ago, or 87 per cent of normal. While a later attack of aphis is probable and sometimes does serious damage an unusual supply of parasites is present and it is believed that the aphis will be controlled successfully.

Last year there were 895 cars shipped. Later an estimate will be made on the number to move this year.

The first carlot shipment in 1915 was on July 4 and in 1916 the first carlot shipment was on June 28. Earlier planting has been done this year than previously and will overcome the backwardness of the season so that the first car lot shipment will be during the first week in July.

Returns from truck crop reports show the per cent of the cantaloupe crop in the following States usually harvested in each month from April to September to be as follows:

	May Pct.	July Pct.	Aug. Pct.	Sept. Pct.	Total. Pct.
Florida	43.8	8.4	0.9	.....	93.0
California	3.0	25.5	25.5	23.0	99.0

Squash Bugs

OWING to the prevalence of squash bugs we have asked State Horticultural Commissioner Hecke for use of engravings and an article from "Injurious and Beneficial Insects of California," written by Mr. E. O. Essig. In the book he says:

"This bug is one of the most perplexing pests which California producers have to deal with.

Description

"The small, somewhat three-sided eggs are dark metallic brown in color and laid in groups of from 15 to 40. The newly hatched bug is light green with pinkish appendages. As it ages, the thorax, legs and antennae become black and the abdomen gray. The adults are dark grayish-brown above, mottled yellowish beneath, and about three-quarters inch long. They secrete a very offensive liquid, the odor of which has led to their being called "stink bugs." They hibernate in any dry, protected place, under boards, rubbish, etc., or in barns or outhouses.

Life History

"The eggs are laid in the spring

Protect Your Crops

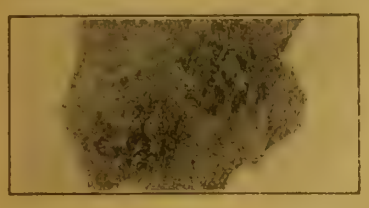
Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

and early summer on the under or upper surface of the leaves or on the stems of the vines. They hatch in about two weeks, and the young bugs begin work upon the small plants, and continue throughout the nymphal and adult stages often causing great damage. The period from egg to adult occupies from one to two



Eggs

months. The latter hibernate and are ready to begin egg-laying as soon as the vines are suitable in the spring. There is only one generation each year.

Nature of Work

"The young adults work upon the young plants, often killing them. They also attack the young foliage

Nymphs

of older plants. In the process of piercing the tissues, these bugs are carriers of fungous diseases, inoculating healthy plants from diseased ones.

Distribution

"The squash bug occurs throughout the state and is especially abundant in the central and southern parts.

Food Plants

"Most of the members of the squash family (Cucurbitaceae), including the pumpkin, squash and gourd, are atacked by this bug.

Control

"Hand picking early in the spring, as soon as the adults appear and begin egg laying, is recommended. The vines are so tender that spraying is impracticable. The bugs may be trapped by placing in the garden boards, pieces of bark or similar material under which they may find shelter. They may then be collected in the early morning and destroyed.

Adults

Young plants may be covered to afford protection until they are able to resist the attacks. Repellents, such as gypsum saturated with kerosene or turpentine, scattered on the land are said to help to drive them away. Clean culture is also suggested, care being taken to burn all vines and rubbish in the fall. Thoroughly fertilizing and watering the land may so stimulate plant growth as to make the attacks of the bug of little avail."

Another Remedy

One more remedy which has been sent to us by Harry S. Smith, in charge of the state insectary at Sacramento, is to smear tar or thick crude oil over paper and place under vines, shaking the bugs upon them. This however, is hardly practicable where a field is to be cleared of the pest.

A Wheatless Egg Laying Ration

WITH wheat so high poultrymen will be interested to learn that on the United States department of agriculture experiment farm excellent egg laying results were secured with a wheatless ration. Thirty Leghorn pullets to which this ration has been fed for 1½ years produced an average of 147.3 eggs per hen for the pullet year. This compares favorably with egg yields secured on other rations containing wheat and therefore more expensive. This pen, moreover, during the first 16 weeks of its second year has averaged 28.5 eggs per hen, 17.5 eggs per hen being produced in March.

The same wheatless ration has been fed since last November to a pen of Buff Orpington pullets which have laid 53 eggs per hen in 20 weeks and hold the highest egg record of any of the large feeding pens of pullets at the farm this year. Two other pens, however, are less than one egg per hen behind this pen.

The ration used was as follows: Scratch mixture.—Two pounds cracked corn, one pound oats. Dry mash. —Three pounds corn meal, one pound beef scrap.

The scratch mixture was fed sparingly so that the hens ate about equal parts of this mixture and of the dry mash. The total grain consumption of feed for the year was 52 pounds, of which 26 pounds was scratch mixture. Throughout the year it took 4.6 pounds of feed to produce a dozen eggs.

If the wheat is omitted from the ration it is essential to feed a considerable proportion of beef scrap in the mash, but with present prices beef scrap is one of the cheapest poultry feeds considering its high protein content.

These experiments, the specialists say, prove that wheat is not essential in an egg laying ration and that excellent results can be secured by using corn and oats as a scratch mixture provided this is fed with a good mash containing 25 per cent beef scrap.

National Egg Laying Contest

By C. T. Patterson, Director

MAY report of sixth national egg laying contest at Missouri state poultry experiment station at Mountain Grove.

The contest at present is ahead of any previous one. The average eggs produced during the first seven months of each contest are as follows:

First contest, 80 eggs per hen; second contest, 85.6; third contest, 97; fourth contest, 83; fifth contest, 99.6. fourth contest, 83; fifth contest, 99.6; sixth contest, 109.

The average eggs produced per hen during May of each of the six contests is as follows: First contest, 17.5 eggs per hen; second contest, 17.5; third contest, 19; fourth contest, 17; fifth contest, 18.2; sixth contest, 19.8

Twenty-eight per cent of the hens went broody during May.

The cup for May was won by pen 49, White Plymouth Rocks, Missouri, which averaged 7.3 pounds each. The five hens produced 134 eggs during the month, or an average of 26.8 eggs each.

The pens occupying the five highest places for May are as follows:

White Plymouth Rocks, Missouri, 134 eggs; S. C. White Leghorns, Pennsylvania, 128; S. C. White Leghorns, Missouri, 126; White Wyandottes, Missouri, 121; S. C. White Leghorns, Pensylvania, 119; S. C. White Leghorns, Missouri, 119.

The ten highest pens to date are as follows:

White Wyandottes, Missouri, 754 eggs; R. C. R. I. Whites, New Jersey, 722; S. C. W. Leghorns, Missouri, 693; S. C. White Leghorns, Pennsylvania, 641; S. C. Reds, Iowa, 640; Barred Rocks, Missouri, 638; White Orpingtons, Missouri, 634; R. C. Reds, Missouri, 631; S. C. R. I. Whites, Michigan, 625; White Rocks, Idaho, 609.

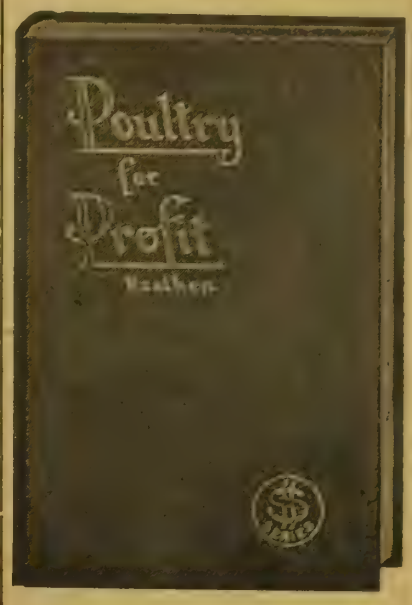
Poultry can be made to Pay



THERE are two methods of gaining knowledge, necessary to make poultry a success; experience—which is a long, drawn out, expensive road and the one too commonly used. Another method is by the careful studying of books written by practical poultry people who have made mistakes and successes and are willing to give this information in order that you may take the short road to poultry success.

Poultry for Profit
BY
Jean A. Koethen
Graduate of University of Calif.

Gives more practical knowledge of every branch of the poultry business in a more concise and simple manner than any similar book published. With the knowledge gained by a study of this work experience in the poultry business is not as necessary. Through its guidance obstacles are overcome before it is too late.

The book is 5½x8 inches and contains 12 chapters, with over 225 pages of text and 18 pages of illustrations, printed on eggshell book, binding full cloth vellum de luxe.

Equip yourself mentally First. Invest your capital LATER.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Illustrations on cover page this week speak for themselves. The photographs were taken by the Cultivator at the demonstration of frost fighting appliances at Pomona and give an idea of the variety of apparatus now on the market. Nearly all are effective and some of them are economical. As an insurance proposition frost fighting equipment, which may be had within economic bounds, is invaluable. Perfect equipment is not yet devised, but it is coming.

INDEX

The best reading in this issue of the Cultivator is on pages 726 and 727. On those pages are references to contents of Volume XLVIII, a whole library of information on things agricultural in California.

The Cultivator is well worth filing for the information it contains is made available by the index which is published in the last issue of each volume; in other words, the last issue in June and the last issue in December. File the Cultivator, have it bound at the end of each six months.

EFFICIENCY

Work less and accomplish more seems to be the motto of subscriber contributors to the household department in this issue. "Woman's work is never done" may become obsolete if the women will but take some of the hints on these three pages and make electricity and make gasoline and make compressed air "do it." Labor saving appliances find quicker purchase when they help in raising crops than when they help in raising children and in making the home comfortable and liveable. But let the farmers see to it that the drudgery of the household is lightened so far as possible and the woman given a chance to get her work done, at least occasionally.

Speaking of labor lighteners, one of the contributors mentions the phonograph. Even though there is natural talent in the family, the phonograph record may add reproductions of the most wonderful music in the world and bring into the home inspiration and culture which may be gained in no other way.

FALL POTATOES

See Professor Vaile's article on the third page of this issue. There have been innumerable mistakes in planting and growing the spring crop, for there have been great numbers of amateurs who have gone into potato growing. The growing of the fall crop is even more difficult, but for California the fall crop has far greater value than the spring crop. To secure a stand intelligent harvesting and handling of the seed is necessary. Professor Vaile gives some good suggestions.

BUILD A SILO

Built your silo yet? Fortunately for the live stock man, grain is coming down. When grain comes down all other feeds follow suit, but come down as much as they will the live stock man is confronted by a situation more difficult than any he has faced before, for prices are still high and will remain high for many months. It is not yet too late to plan for the silo. No cheaper feed can be purchased. Every live stock man should use the silo as never before.

CITRUS EXPERIMENT STATION

The citrus experiment station at Riverside is assuming form. This may be considered a somewhat delayed statement, for a station has been maintained by the University of California at Riverside many years. But in 1915 Riverside was chosen as the site for a new and greatly enlarged station, and the state university proceeded at once to make plans for a great experimental work and for a school for post graduates which should have a world wide influence.

The plans have not all matured for they are ever growing. But with nearly a dozen buildings almost completed, some of them on most prominent sites, one now gets more of an idea of the scope of a great institution.

But in addition to administrative building, laboratories, residences, barns and other buildings, and the experimental plots, an interesting feature at this time is—Beans. Not for experimental work but for practical feeding of hungry folks, the force is now planting beans, not "back-yard" beans but broad acres of beans.

So our new station starts with being practical and fitting itself to conditions.

SAFETY FIRST

Brave little Ojai in Ventura County is rebuilding its homes in the ashes. Hundreds were made homeless by the "carelessness of a camper." Rangers and others are endeavoring to trace the cause of the fire and find the guilty ones. While Ojai may build better and finer, and other crops may be grown to replace the hundreds of acres destroyed, it takes time and suffering to do it.

In an appeal to all the people to observe every possible rule for fire prevention it is stated that $200,000,000 is the annual fire loss of the United States: "If all the buildings destroyed during any one year were erected on the two sides of a single street they would stretch out along that street for a thousand miles. To accomplish this annual destruction, fire starting at one end of this street would have to burn at the rate of three miles a day for every day in the year. Going through such a burned street at every 1,000 feet one would pass the ruins of a building from which an injured person was being removed, and every three-quarters of a mile would be the ruin of a building in which a life was lost."

In these days of many ciphered figures $200,000,000 means but little, but to make it more evident to our ordinary minds this way of stating it makes it more emphatic.

Of all the places in the world where care should be exercised, semi-arid California calls for most consideration of "safety first." Our continual preachments along this line may seem trite, but we are surely a careless people and continual reminder seems necessary. The best of all precautions is common sense.

Do not leave the camp fire with a single coal alive. If a smoker, swallow the stubs, especially of cigarettes Above all, hoe the dried grass and weeds away from all buildings. An extra barrel of water or a box of sand make excellent fire extinguishers.

If selfishness does not inspire to take this extra precaution, do it as an act of patriotism.

NEW SEED

The department of agriculture sends out warning to farmers to exercise care in purchasing seed of new and untried varieties of sorghums. We believe the department might have gone farther and given warning against the indiscriminate buying of untried seeds of any crop. We would not urge against the trying of new things, only that the trial be made in a small way. Farmers have been offered "Miracle Wheat" and "wheats" going under other miraculous names which have proven entirely worthless, yet the seed was purchased at enormous prices.

One of the new kafirs which is being worked off on Middle West farmers is called the Schrock. It is said to be remarkably early and to have great drouth resistance. The department says that it requires so long to reach maturity that it will suffer more from drouth than other varieties. The department has tested it out at its stations in Kansas and Texas.

CHEAPER FARM MONEY

With all the patriotism being manifested in great subscriptions to the liberty loan it will be well for those who have money, whether little or much, to remember that equally as important as great funds for the purchase of guns, ammunition and food for the soldiers is the production of food. Producers are finding their problems many. Implements and all farm supplies have advanced enormously in price. Bankers do not seem to recognize this need, at least not as a rule. It is hoped that the federal farm loan will aid greatly in this supplying of cheaper money, but if it were possible for other large interests to give opportunities to farmers to secure funds at a reasonable rate of interest relief could be had much sooner.

PLANTING POTATOES DURING MIDSUMMER

By R. S. Vaile, Citrus Experiment Station

IT is often very difficult to secure a satisfactory yield of potatoes when the seed is planted during warm weather. There are two conditions which are largely responsible, namely: First, the use of seed which has not been properly matured, and, second, the improper treatment of the soil prior to planting.

Handling the Seed

The spring crop that is to be harvested should have been planted during the period from February 1 to March 10. It must have been grown on land free from potato diseases. Tuber moth should have been avoided so far as possible by high banking of the plants in the row. The potatoes should be dug when the vines are brown but not completely dry. The skin of the potato should not slip when handled. Hand digging is usually the most satisfactory method of harvesting potatoes for seed. Great care must be taken not to bruise during the digging.

Immediately upon digging, the potatoes should be stored in a place that is cool, moist and well ventilated, dark and free from tuber moth. The potatoes may be placed in piles three to four feet high, preferably in a cool screen room. If such a room is not available the pile should be covered deeply with straw. When straw is used care must be taken to have the covering thick enough to prevent tuber moths reaching the potatoes. In any case the humidity should be kept high by sprinkling the piles if necessary. After two weeks of such treatment the potatoes should be carefully hand-sorted. Any that are inclined to be soft should be discarded, as well as any that show sunburn. Planting may be done immediately, provided the tubers show signs of sprouting. If they do not they should be exposed to a weak diffused light until they do sprout. Any tubers that do not show definite signs of sprouting should be turned over to the commissary department.

Treatment of the Soil

It is very important in order that a good stand may be obtained that the soil be thoroughly moist and as cool as possible at the time of planting. This is best done by irrigating heavily a week or two before planting and putting on a second application of water a few days before the field is to be used. The soil is not worked between the applications of water.

The second irrigation is helpful mainly in cooling the soil, and the field should be plowed and worked into shape as soon as the earth has dried sufficiently to allow its proper preparation. The potatoes should be planted immediately afer the field is thus prepared, and it will be found much more satisfactory, if a considerable area is to be planted, to divide it up into small tracts, for if too large a field is handled it will be impossible to plant as soon as desirable.

Time of Planting

The time of planting will vary somewhat with the locality. In Central and Northern California planting should be finished before the middle of July or else the fall frosts may catch the crop. In Southern California, on the other hand, planting should not commence before July, 20 and should be finished by August 10.

Agricultural News Notes of the Pacific Coast

Northern California

Nevada County reports prospects for a very large crop of pears and apples.

The Oroville Register reports contracts being made for plums at $40 a ton, apricots $50.

The Glenn County farm adviser states that hay crops in that county are 120 per cent of normal.

Several large plantings of Large White and Small White beans are being made in Shasta County.

Sycamore, Colusa County, reports a big crop of grain, especially barley, which is now going into warehouses.

Representatives of the Prune and Apricot Growers' Association are securing crop agreements in the Hayward district.

Horticultural Commissioner C. K. Turner of Placer County reports very heavy plantings of plums and prunes in that county.

"Russian thistle is now practically cleared from all lands in Butte County" is the report of Horticultural Commissioner Earl Mills.

Sheep and cattle are now coming in to the summer ranges on the Tahoe national forest. The feed is very backward this season.

Yolo County reports 131,885 acres planted to barley; alfalfa has the next largest acreage, 38,105; beans take third place with 34,537.

The rice mill at Biggs has just finished the cleaning of 205,000 bags and will soon be put in shape to handle the coming season's output.

Horticultural Commissioner Mills of Butte County has outlined certain quarantine areas within that county to prevent the spread of olive knot.

The bean thrips is doing some damage in Placer County. Farm Adviser Amundsen is recommending the use of a spray of Blackleaf "40" and soap.

Peach growers affiliated with the California Peach Growers' Association are gratified at the financial report of the company made at the recent annual meeting in Fresno.

"One of the best grain crops in years" is the report coming in from farming sections about Dixon, Solano County. At present prices the grain crop is often worth more than the land.

The Paradise Irrigation District of Paradise, Butte County, has been granted a permit by the state water commission to appropriate 9500 acre feet of the waters of Little Butte Creek.

A desire to "do their bit" though deprived of their personal liberty is evidenced by the purchase of liberty bonds by prisoners in San Quentin, some of whom are serving life sentences.

Yolo County has a council of defense which has inaugurated a campaign to prevent fire losses. The aim of the campaign is to save the food crops this year when they are so bitterly needed by the world.

The Oroville plant of the California Ripe Olive Company is installing the necessary machinery for handling the tomato pack for which it has a government contract. Numbered among the products of the company at the present time are ripe olives and olive oil, mayonnaise dressing, honey, marmalade and dried figs.

Central California

The packing house at Sultana, Tulare County, is running on Valencias.

Fresno organizations are urging government aid for the Pine Flat dam project.

The trustees of the Peach Growers' Association have re-elected the old board of trustees.

Tulare County is distributing five tons of poisoned grain in its campaign against ground squirrels.

The Fresno District Fair Association is offering many prizes to boys and girls of that section for exhibits at the coming fair.

The last of the sales of canning peaches was recently closed at Visalia, bringing $50 a ton, against $27.50 and $30 last year.

Santa Clara Valley will hold its third annual Prune and Apricot Exposition on September 21 and 22. It will be held at Mountain View.

The Cooperative Creamery Association at Porterville is liquidating claims against it and it is asserted all obligations will be met.

The cannery at Mountain View, Santa Clara County, has been doubled in size, and a large pickling and catsup factory has been built.

The alfalfa meal mill at Kerman, Fresno County, expects to turn out several tons of alfalfa meal this season, starting its run this week.

Two combined harvesters and hundreds of acres of grain and pasture, together with farm buildings, were burned near Montpellier, Stanislaus County.

Contracts have been completed between 45 packers of the state and the Prune and Apricot Growers, the new packers' association to be known as the Affiliated Packers.

Scarcity of feed for flocks has caused disappointment among sheep men because of the decision of the national park service to allow no sheep in Yosemite National Park.

The Turlock Merchants and Growers' Association is making plans to install a bean cleaning plant and will build a large ware house for the exclusive purpose of handling beans.

Better plans for shipment of fruit and produce from the Modesto, Turlock and Merced districts were discussed at a joint meeting of railway and fruit men in Turlock recently.

Some subjects under consideration at the recent conference of grape men, packers and shippers of the state at Fresno were standardization of pack, the wage problem, future of the industry, etc.

The Valley Fruit Growers Association of Fresno County has fixed on contract prices for harvesting raisin grapes as follows: Muscats 3 cents per tray of 22 pounds, Thompson 2½ cents, Sultanas 2½ cents.

The Tulare Canning Peach Growers' Association has contracted its peach crop to the California Packing Corporation at $27.50 for freestones, $45 for Orange Clings and Tuscans and $50 for Phillips.

A movement is on foot to organize dairymen of the San Joaquin Valley in an association similar to the peach and raisin companies. A committee, one member of which is appointed by Market Director Weinstock, has been delegated to work out the preliminary steps.

Southern California

There is a big supply of new potatoes on the market.

San Diego is trying out a new aerial fire fighting truck.

A sale of 18 bales of cotton at 25 cents is reported from Imperial.

Canneries of Lankershim, Los Angeles County, have opened for the fruit season.

Riverside reports a good attendance at its poultry institute, notwithstanding the hot weather.

Tests of orchard heaters were made last week at Pomona on the San Antonio school grounds.

The city of Chino is cutting the barley hay on its sewer farm. There will be more than 100 tons.

The extreme heat of the past week is thought by some citrus growers to have killed off many scale.

Potato growers of San Bernardino County are reported seriously embarrassed by shortage of labor.

Calexico is planning a big Fourth of July celebration, to which it invites all of Imperial County.

The fruit and vegetable cannery at Hueneme is nearly completed. It will be ready for the fruit pack.

Ojai, Ventura County, which suffered so terribly from the recent forest fires, is already rebuilding.

Cotton growers of the district about Seeley, Imperial County, are discussing the building of a cooperative gin.

The Alamo canal of the Imperial Irrigation District is carrying 25 per cent more water than at this time last year.

The Covina Farmers' Club will join with the Claremont Pomological Club in its meeting at Ganesha Park, Pomona, today.

Nuevo, Riverside County, has shipped out 15 carloads of potatoes, marketing them early in the season at 3¼ cents.

Several apiaries were destroyed by the fires which recently burned over sections of the Santa Barbara national forest.

Fillmore, Ventura County, reports damage to apricots by sun burning; also some young lemon trees have been damaged.

The Arlington cannery is now working on cabbage, which is being made into kraut and packed in half and quarter barrels.

The very hot weather of the past two weeks is reported to have done some damage to bean fields, but more benefit in the killing off of bean aphis.

Cherries in the Yucapia and Beaumont district have ripened with a rush under the excessive heat and will not last much longer on the trees.

R. K. Walker of Devore has been in Imperial Valley for the past few weeks arousing interest in exhibits at the Riverside County fair, to be held at Riverside October 9-13.

The University of California will send experts to Riverside next month to give demonstrations in methods of curing and canning meats, fruits and vegetables. The demonstrations will begin about the 20th.

At the recent meeting of alfalfa growers of Southern California at Riverside reports showed that Southern California has been shipping hay to Nevada, Idaho and Utah because of short crop in those states due to late spring.

The Coast

Oregon has passed a $6,000,000 road bond measure.

Warm weather is reported all over the Pacific Coast.

Colorado has quarantined against the potato tuber moth.

The Oregon State Grange met in annual session at Astoria last week.

The Portland Union Stock Yards report the bulk of hog sales being made at $12.

The contract has been let for a $5000 creamery building at Phoenix, Arizona.

Wednesday June 6, was celebrated as Strawberry Day in the state of Washington.

Hogs are now selling at the North Portland Stock Yards at $15.25 for extra fancy stock.

Idaho stockmen are refusing to sell veal calves and all are trying hard to increase their stock.

Wheat is declining at all coast points. One day's drop at Portland showed a loss of 13 cents.

For the first time in its history the fair to be held at Boise, Idaho, will receive a state appropriation.

Redistricting the entire Yuma Valley of Arizona for school purposes is on the program for early fall.

Chandler, Arizona, cotton growers announce that they found blossoms on their cotton as early as June 13.

A 75-ton capacity fruit and vegetable dryer has been erected by the Idaho Products Company at Payette.

Texas vegetable markets have been given wonderful impetus because of the location of army camps in that state.

An independent sugar factory, the Beet Growers' Sugar Company, at Rigby, Idaho, has been capitalized at $1,500,000.

B. G. Webster of Phoenix, Arizona, has been adding a large number of registered Holstein cows and bulls to his dairy herd.

A farm survey of Coos County, Oregon, shows a farm acreage of over 100,000, while only 18,464 acres are producing crops.

November 8-15 is the date of the Northwest Live Stock Show at Lewiston. Ten thousand dollars cash premiums will be offered.

The town of Cove, in Eastern Oregon, boasts an output of 100 carloads of cherries, which will bring to that section $65,000 for this season's pack.

The Yuma Sun states that the drainage ditch proposed by the reclamation service will be opposed by 80 to 90 per cent of the farmers of Yuma Valley.

H. C. Seymour of extension department of the University of Oregon, after traveling over the state, declares that Oregon's food crop will be doubled this year.

According to telegrams to the reclamation service the Colorado will reach a depth of 30 to 31 feet by July 1. All northern streams are still rising. It is not thought the Yuma levees will be damaged.

The Southern Idaho Dairy Loan Association, the object of which is "to stand betwen the farmer and the banker, to further the dairy interests of the farmer and protect the banker in the matter of loans," has been formed. The president is R. E. Shepherd of Jerome.

Santa Anita Rancho
Anoakia Breeding Farm

ARABIAN THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three-year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars. Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

Correspondence Invited

Anita M. Baldwin

W. H. TAYLOR, Superintendent — Santa Anita, Cal.

State Dairy Cow Competition

THE following cows produced over 40 pounds of butterfat during May, 1917. Name of owner is given first, then list of cows with performance. The abbreviations Gr., Ay., G., H., J., stand for Grade, Ayrshire, Guernsey, Holstein, Jersey. The first figures indicate age (where age is not given it is indicated by dash). For instance, "Mabel Haskins Colantha Girl H. 4-2" means that animal is a Holstein aged four years and two months. The next figure (63) indicates number of days in milk at beginning of month; the next (2063.2), production of milk in pounds for the month; the next (3.36), percentage of fat; the last (69.324), pounds fat for the month.

Abbott, K. W.—Fidessa Butter Bell, H., 4-2, 5, 2199.7, 4.10, 90.188; Mabel Haskins Colantha Girl, H., 4-7, 63, 2063.2, 3.36, 69.324; Roma Yuba, H., 8-5, 20, 2352.7, 2.93, 68.934; Ione, Gr. Average production of competition cows for month of May (253 cows, 90 days in milk, on the average): 1309.7 lbs. milk, 53.660 lbs. fat. (Range, 102.858 to 17.954 lbs.)

California Gets Famous Guernsey Bull

Of more than ordinary interest is the recent purchase of the world-renowned Guernsey sire, Itchen Daisy's May King of Langwater by R. E. Nixon, proprietor of the Revada Guernsey Farm of Napa County. Some of the highest priced live stock in America has been brought to the Pacific Coast in recent years, but the Nixon importation not only breaks all existing Western records, but is the world's record price for the breed. This bull cost Mr. Nixon $8,000, is seven years old, and is a full brother to the noted Ne Plus Ultra. He has been the leading herd sire of the J. L. Hope Florham Farms at Madison, N. J., for years. Several of his first daughters are now on official test, and two of them brought $1,325 each in the recent Florham auction. Mr. Nixon's bull and Ne Plus Ultra are out of the same dam, Imp. Itchen Daisy 3rd. She is also the dam of Langwater Dairymaid, the record priced cow of the breed, and Imp. King of the May.

1916 fair goers will recall the sensational show winnings of the Nixon Guernseys their first time out, and it is the intention of the owner to show again this year. The home of the Nixon herd is one of the finest and most up-to-date in the country and is considered a show place in every respect. With this wonderful young bull to "nick" with the splendid lot of females on the place some new records for production are certain.

Itchen Daisy's May King of Langwater, 17349
A great Guernsey bull recently purchased by R. E. Nixon of this state.

Field Notes From the Live Stock Men

The Dupee herd of Guernseys at Edgemoor Farm, San Diego County, reports another notable record made by the imported cow Mildred 2nd of Les Godaines. She has just finished a year's test of 14,890.9 pounds of milk and 702.24 pounds of butterfat. As a four-year-old she had a record of 11,546.9 pounds of milk and 575.06 pounds butterfat. She is a show animal as well as a heavy producer and was first prize four-year-old at the San Francisco worlds fair. Her sire is Imp. Old Paddy, an Advanced Register son of Governor of the Chene.

Many California and Arizona cattlemen went East to attend the big Harris dispersal sale of Model Herefords at Harris, Missouri, June 26-27. Over 400 head of animals were sold under the hammer, and the fact that these cattle had not been fitted for sale of show purposes but were sold right off pasture appeals to our western cattlemen who are partial to vigorous, big boned, breeding animals, and at the Harris sale they were given a rare opportunity to secure some of the best individuals of the breed. The White Face has assumed a leading position on the western range and is gaining in popularity rapidly.

The fallacy of indiscriminate marketing of all kinds of livestock, in-

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises or Wounds, Felons, Exterior Cancers, Boils, Corns and Bunions. CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

"Selecting and Developing the Jersey Herd"

Is a booklet by Prof. Hugh G. Van Pelt. It tells how you can build a well-developed, money-making Jersey herd by proper selection and judicious breeding. The future of your dairy herd depends upon how you select your foundation animals and how they and their offspring are developed. The Jersey cow combines beauty with dairy conformation. Healthy, vigorous and profit-producing, she lifts the mortgages and increases bank accounts. Send for book today.

Direct Connected

The Yuba Ball Tread Tractor is like a direct connected engine and pump—most of the force generated is used to pull the load—less is required to push the machine—there's no slack belt to drag.

The Yuba Ball Tread is made for business farmers who figure the cost of doing each unit of their work.

If you are a business farmer send for the catalogue, and tell us how many acres you have.

When writing advertisers, mention the Cultivator.

cluding females of the different breeds, is becoming daily more apparent. Those who predicted an early and sharp decline in meat prices as a result of heavy liquidation have another guess coming. Price levels are unusually firm for cattle, hogs, and sheep and will continue to be firm indefinitely. The cattle shortage is particularly acute, and both mutton and wool are world sought commodities. The wise breeder will hold on to his females as long as possible and not glut the market with cheap, thin stuff.

T. T. Miller of Los Angeles has been establishing a remarkable herd of Shorthorn cattle this year. About three months ago he brought out 40 head of the best to be had in the Middle West. Then he purchased the two highest priced cows at the Carruthers sale in early May. But the most notable addition to his string was made a couple of weeks ago at the Chicago Shorthorn combination sale where over 200 animals averaged $1120 per head. Mr. Miller again topped the sale by paying $3100 for the famous red cow, Brandsbys Jinney 18th, a cow with an unbeatable reputation in the London show yard. Unquestionably, the Miller herd ranks with the very highest class herds of Shorthorns in the West. The owner has spared no expense in assembling the herd and has secured quite a number of the best bulls and females from the leading American breeders. Southern California is particularly fortunate in being the home of the Miller herd, in that it will be an important factor in the development of the beef industry.

According to a recent press dispatch from Chicago, the federal trade commission will commence the long deferred investigation of the meat problem, July 1st. The commission with its legal power to subpoena witnesses, and assisted by both the department of agriculture and the various national live stock associations, will endeavor to remedy the evils in connection with the production, marketing, and distribution of meat animals and their products. If the time ever comes when these most important problems are solved to the satisfaction of both producer and consumer the live stock industry of this country will indeed be on a sound economic basis.

Dr. Michael Creamer of Owensmouth, Los Angeles County, reports two fine Duroc-Jersey litters, eight and ten out of his two gilts purchased from the Stewart estate of Ohio, for a price of $180 each. These pigs are sired by a son of Orion Cherry King that recently sold to Welendorf and son of Algona, Iowa, for $1200. These sows will be rebred to Grand Golden Model.

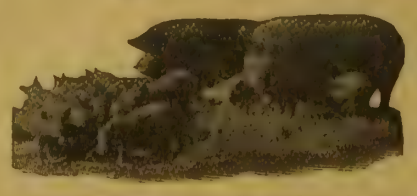
The Delta Farm and Live Stock Company of Colton recently purchased ten registered Holstein cows and two bulls at the Stalder sale. This is a beginning of the 100 head of registered cows they intend to secure. Southern California is due to have another real Holstein herd here.

Frederick M. Johnson of Napa reports the following sales: Bred sow to Dr. Geo. A. Spencer, Fair Oaks; boar to D. V. DuBois, Napa; boar to P. Headley, Napa; boar to L. R. Adams, Island Mountain; boar to I. L. J. Gamble, Middletown.

Miss Dutch 2nd in the A. W. Morris Company herd has completed a 26.40 pounds of butter seven day record. She is a four year old sired by Korndyke Queen De Kol's Prince. Her dam has made a 30 pound seven day record. Miss Dutch 2nd is a good looker and bids fair to make over 1000 pounds butter in a year. If she does this she will be the third generation to make this record which will set a new state mark.

C. B. Cunnigham reports sales of Chester Whites as follows: Two bred gilts and young service boar to Alexander Baldwin, Hilo, Hawaiian Islands; service boar to Mayor James Rolf, Jr., San Francisco; one boar and one gilt to R. B. Piper, Lake View, Oregon; two bred gilts and a service boar to W. Wilbur, Swisshone, Oregon; service boar to T. H. Mullens, Tranquility; bred gilt to Charles Soule, Little Shasta; three bred gilts to Peter P. Hovley, Brawley; bred gilt and young boar pig to George A. Bruns, Livermore; bred sow to C. E. Weikert, Fair Oaks; bred gilt to Charles Rayburn, Placerville; sow pig to William Butler, Woodland; bred gilt to F. E. Rice, Livermore; service boar and open gilt to William Schrumpf, La s; bred gilt and service boar to James McGillivray, Galt; young service boar to T. N. Hudspeth, Fallbrook; bred gilt to Charles L. Shook, Escalon.

Hog Cholera



Mr. L. B. Green and Dr. R. M. Leaf, in introducing Dorsett & Niles methods of U. S. Government, License No. 18, Anti-Hog Cholera Serum, through the Kansas City Stock Yards Serum Co., wish the Hog Raisers of the State of California to watch the splendid results obtained in Imperial Valley. A few names referred to are: Timken Ranch Co., Lyons Bros., Russell & Stuart, C. H. Westmoreland, D. Messman, Farris Bros., and many others. Dr. R. M. Leaf is a specialist in Hog Cholera and Tubercular Serum making—also Black-Leg and Anthrax Vaccine and its application and effects. Anybody wishing information, he will gladly give same from Los Angeles office, 401 Bryson Building, 2nd and Spring Sts. Phone Main 1107.
(Cut this out for future reference.)

Purebred Registered
HOLSTEIN CATTLE

$53,200 PAID FOR HOLSTEIN BULL CALF. The greatest tribute to the superiority of Holstein-Friesian cattle was paid in the auction sale at Worcester, Mass., June 7 and 8, where a Holstein Bull Calf brought $53,200, a Holstein Cow $18,300 and a Holstein Heifer $18,000. 143 animals were sold for $296,470, or an average of about $2,073 per head. In 1916 at Detroit, Mich., 140 animals were sold for an average of $1,173 per head. This great increase in selling values is proof conclusive of Holstein popularity, partly due to Holsteins raising in the past year all world's 7-day records for milk and butter. The world's record for butter in 7 days is now over 50 pounds.

Ring Oiling Gland.

We also build deep well turbines, deep well plungers, horizontal and vertical pumps for mining, irrigation, drainage.

We Need More Hay

IN our anxiety and patriotic endeavor to comply with the call of our president for the planting of more food crops for human consumption we have in many instances overlooked the necessity of maintaining and if possible increasing our staple market field crops, mainly hay.

The lateness of the season will necessitate very quick action and a quick-growing crop which will produce a hay of high standard marketable value.

Our government says that Sudan grass is one of the most important forage crops introduced into the United States during the past 20 years and is really the only hay crop that can be planted during the month of July and give quick, paying results.

Sudan grass is of the cultivated sorghum family, having rather a sweet flavor causing it to be highly relished by all kinds of stock. It is an annual, even though in general appearance it may resemble Johnson grass. It has no underground root stocks, so cannot become a field pest such as Johnson grass.

Although Sudan grass as a general rule will give its greatest tonnage on rich, well-drained, sandy-loam soil, it is probably less discriminating in this regard than any other kind of hay crop.

The seed, planted in soil properly prepared for germinating any seed, will grow very quickly; and if planted any time during July a heavy crop will easily be obtained. If proper moisture content is maintained in the soil a second cutting may be expected 35 to 45 days later. This second cutting may also be encouraged by a second irrigation. Our unusually cold spring weather has made Sudan grass planted early very slow in going forward up to the recent hot spell; but rapid and phenomenal growth has been made since then in all fields under the writer's observance. Right now is an extremely favorable time for planting on account of the splendid growing weather.

If you are unable to irrigate in order to produce a second crop cutting, but have sufficient moisture to produce one crop, you can figure on cutting a crop of hay and then having left in a small second growth a splendid pasturage.

Sudan will not necessarily be killed out by frost, as there are instances where it lives through the winter in the warmer sections, producing pasturage, and then in the spring growing up and producing a splendid hay crop. This was the case in portions of San Diego County and also in the Imperial Valley. While during the winter there may not be a great deal of growth from the crown, the plants themselves remain alive; but as stated above Sudan grass in no way becomes a pest and a single plowing will eradicate it once and for all.

Discouraging "Rustling"

Complaint has come to the Cultivator from subscribers that cattle rustling is not entirely ancient history in California. Even in "close-in-sections" a fine young veal or often more valuable stock disappears. A subscriber who has failed to get any help from county officials asks the Cultivator what may be done. The matter was taken up with Fred H. Bixby of the Los Alamitos Ranch and vice president of the California Cattlemen's Protective Association, and he writes: "I should advise your subscriber, who has had calves stolen, to join the Central Stockmen's Association of San Luis Obispo, and report any "rustling" to that association, as they have detectives in the field all the time. It is the only organization in the state that seems to have gone ahead and tried to put a stop to the stealing of cattle. In fact, that is its one aim. The California Cattlemen's Protective Association was formed for the purpose of having a bill passed by the legislature of the state similar to the Arizona bill relative to the brand inspection of cattle and hides. This bill as originally proposed had to be amended several times, but finally passed both houses, and I understand has received the signature of the governor. The protective association and the cattlemen of the state will probably amend this at each meeting of the legislature until it becomes as effective as the Arizona law. In regard to the Central Stockmen's Association, will say that the president is Mr. Howard Jacks of San Luis Obispo, and the secretary is Mr. Hollister, San Luis Obispo, and if you will put your case to either one of them they will act immediately."

Cottage Cheese

COTTAGE CHEESE is a good summer substitute for meat. It is a most healthful, economical and on most farms plentiful food. It can be easily made an a small scale and requires no special equipment. Each pound furnishes as much protein or body building material as the same weight of beef. It is, however, not quite so rich in its energy supply as meat.

Because of its ease of making it is desirable to make the cheese often, so that it may be eaten fresh, although if it is kept cool it will not spoil for several days. The following directions have been prepared by the dairy division, United States department of agriculture:

Setting

Select as much good skim milk as will be neded for a two or three days' supply. Each gallon of skim milk will make about one and a half pounds of cheese. The skim milk should first be placed in a pail or shotgun can, warmed to 75 degrees Fahrenheit and allowed to stand at that temperature until curdled. A thermometer should always be used; never guess at the temperature. The temperature can be controlled by keeping the pail or can of milk in a tub, sink or other vessel filled with water of the same temperature. The time required for curdling will depend upon the freshness of the milk. When a starter or good sour milk is available a better and more uniform cheese can be made and the time for curdling lessened. About a cupful of starter or good sour milk per gallon of skim milk is sufficient, although more may be used. With that quantity of starter the skim milk will curdle in from 10 to 15 hours, while without starter fresh milk may not curdle for 24 hours or even longer. The greater the quantity of starter the sooner curdling will take place. During the setting no special attention is necessary. As soon as a firm, smooth curd has been formed, it is ready for cutting.

Cutting, Heating and Stirring

The curd is cut into one-inch or two-inch squares with a long-bladed knife. The temperature of curdled milk (or coagulum) is then raised to 100 degrees Fahrenheit, and the mass stirred gently from time to time. When that temperature has been maintained for about half an hour the curd is ready to be drained. The degree of heating largely determines the dryness of the cheese; the higher the temperature the drier the cheese will be.

Draining

After heating the curd is poured into a cheesecloth sack or a piece of draining cloth thrown over a pail. If a pail is used it will be necessary to pour out the whey occasionally, so that draining will continue. In 15 or 20 minutes the curd will become mushy and will drain more slowly. The sides of the cloth may then be raised and lowered every few minutes to hasten draining. When the curd is rather firm and the whey has nearly ceased to flow, it is ready for salting, although tastes differ somewhat, some preferring a dry, others a soft, moist cheese.

Salting

The cheese should be salted to suit the taste. Usually, however, from one to two teaspoons per gallon of milk is about the quantity desired. The salt may be sprinkled over the curd and worked in with a spoon or paddle. The cheese is then ready to eat. If kept several days it should be stored in an earthenware or glass vessel, rather than one of tin or wood. The cheese should be stored in a cold place, as it will keep longer without becoming sour or moldy.

Cottage cheese made with rennet, a junket tablet or pepsin has a finer and more uniform texture and requires less time and attention in making. Any one of these will cause the milk to curdle sooner. The process of making is the same, except that four to five hours after the skim milk is set at 80 degrees Fahrenheit, two or three drops of liquid rennet per gallon of milk are diluted in a tablespoon of cold water and stirred into the milk. When rennet is not available one-eighth of a junket tablet per gallon of milk may be dissolved in a tablespoon of cold water and stirred into the milk. Powdered pepsin may be used for the same purpose, a quantity that will remain upon the point of a penknife being dissolved in a tablespoon of cold water and then mixed with the milk. When rennet, junket tablet or pepsin is used the coagulum is placed in a drain cloth without cutting or heating. A finer and heavier draining cloth is necessary because of the fineness of the curd. The cheese is salted as described.

Sweet or sour cream added to cottage cheese makes a richer and more palatable product.

While for small-scale operation the pasteurization of skim milk may not always be practicable, it permits a better control of the fermentation, increases the yield of cheese and renders the product safe from disease-producing organisms. With pasteurized milk it is absolutely necessary to use a starter.

Cottage cheese is judged by its flavor and texture. A high quality cheese should have a clean, mild, acid flavor and a texture smooth, free from lumps and uniform or homogeneous throughout. Flavor can be controlled by the use of clean, sweet skim milk and a good starter, but texture largely depends upon careful manipulation during the making process.

Ukiah suffered from a severe fire last week.

We will Reward You With This Great Book

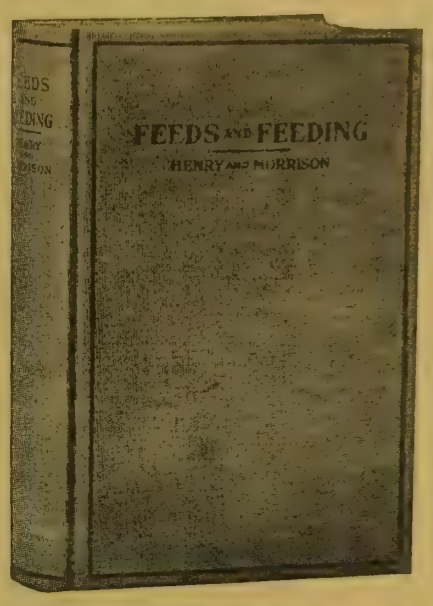
Everybody can have a copy under our liberal offer.
Send for yours today.

Greatest Book on Feeding.

"Feeds and Feeding", by Henry and Morrison, is the recognized standard authority on the feeding of dairy cows, beef cattle, calves, hogs, horses and sheep. The authors at great expense and with much time and labor, have compiled the most important findings of the investigators of both the Old World and the New in the science of animal nutrition, together with the vast number of feeding trials, conducted in California and the experiment stations of other states, the whole being rounded out by the practical experiments of many of the leading stockmen of America.

Latest Edition.

This is the latest edition containing the new chapter "Economy in Feeding Live Stock" and much other information recently found by investigators in this and other countries.



701 PAGES—Cloth bound and full of Valuable Information

How to Get Best Results Feeding California Barley

"Feeds and Feeding" is a large volume, 701 pages in substantial cloth binding, clearly printed in large type and written in plain, understandable language. It is intensely interesting throughout and represents the sum total of hundreds of experiments, trials, and record tests on practically every feeding combination ever attempted and the personal experiences of the authors and many other noted feeding experts from California to Maine.

Full and complete information is given in regard to the feeding and feed value of California barley, how to obtain the best results, and giving the results of many barley feeding tests. (Pages 162, 308, 309, 360, 414, 454, 525, 590.)

We Are Going to Give These Books Away

READ OUR OFFER TO YOU

If you would know feeds, their value, what to feed, and how, get this neat book, that thoroughly covers the subject. With the information it gives at your command, you can cut many dollars from your feeding cost.

Only takes a Little Time.

You can obtain one of these valuable books at no expense—just a few minutes' easy work. To any reader of California Cultivator who will secure for us only three new yearly subscriptions to California Cultivator at $1.00 each—the regular subscription price, we will send a copy of the latest edition of "Feeds and Feeding" by Henry and Morrison. If you want to buy this book it will cost you $2.25 anywhere. You know California Cultivator and how much valuable information you get from its columns each issue. You receive the best thought and experiences of many of the West's most authoritative writers. The results of many tests and experiments and the live stock, dairy and agricultural news of what is going on over the entire Pacific Coast at a cost of only $1.00 per year. Your neighbor, if he is not already a subscriber, will be glad to have you show him a copy. You can get three new subscribers at $1.00 each quickly and easily. Send us the $3.00 and the subscribers' names and addresses and we will send the book to you postpaid. You may include your own subscription by paying a full year in advance of this date and including two new subscriptions at $1.00 each. There must be at least two new subscriptions for one year.

Capri Figs Ready July 5th to August 10th. Well colonized. Tribble Bros., Elk Grove, Calif.

GREAT SHORTHORN CONGRESS

Secretary F. W. Harding of the American Shorthorn Breeders' Association made the announcement at the recent Chicago sales of a Shorthorn congress to be held at Chicago the third week of February next. This event is to be nation wide in its scope. It is the purpose to hold shows each forenoon, sales in the afternoon and Shorthorn meetings, conferences, banquets, etc., each evening. The fourth day will be devoted entirely to the milking Shorthorn interests.

Three hundred and fifty to four hundred cattle, to be selected on the basis of individual excellence, will be offered in the sales, and the show entries limited to these animals.

HAY

Under date of June 23 Scott, Magner & Miller say:

Arrivals week ending today, 1511 tons. Old hay is cleaned up and practically all of above arrivals consisted of new crop. It was necessary for dealers to go into the fields and make a few small purchases here and there to supply the present light requirements. Many producers are asking prohibitive figures. The abnormally high figures of old hay were brought about by scarcity of pasture the past season. Second cutting alfalfa is coming into the market, selling at about the same figure that prevailed for first cutting. Our prices given below are on new hay only.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market. For prices to consumers charges of cartage, commission and handling expenses must be added.

Citrus Fruit Market

LOS ANGELES, June 27, 1917.

Better grade navels are practically all cleaned up at Eastern end, the few remaining selling at low prices and the fresher Valencia stock coming in commanding much higher price. Valencia shipping has been rather slow during the past week because of fruit softening during hot spell. The Fourth of July has also stimulated trade and large purchases have been made in anticipation. The slight car shortage and shortage of shook has also complicated the shipping situation.

Lemons are commanding exceptionally fine prices and 1500 cars in storage in Southern California houses will all command long prices.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 31,094 cars, lemons 4788, total 35,882; to same date last year, oranges 24,747, lemons 4772, total 29,519. From Central California to date this season, oranges 4649, lemons 164, total 4813; to same date last year, oranges 5390, lemons 146, total 5536. From Northern California to date this season, oranges 845; to same date last season, oranges 610 cars, lemons 1.

FROM THE AUCTION

You'll Like These Attractive Gingham Frocks at $1.95

—"DOTTY DIMPLE" dresses—models which women will find practical for wear around home.
—Made of fine gingham in plain shades, stripes and plaids of nearly every color and color combination.
—We picture two of three styles: No. 1, in pretty plaid, has wide girdle of white galatea supported by shoulder straps of gingham, and big novelty pockets. Open front style.
—No. 2, a V-neck slipover model, is in plain colors and stripes, with collar, girdle and V-shape patch pockets of contrasting color.
—A third has vestee of white pique. Some of the dresses have embroidery on collar and cuffs.
—All cut full and well made. In sizes 36 to 44.
—We pay parcel postage on these dresses.
—You'll find it satisfactory to buy from The Broadway Department Store by mail. We guarantee every purchase and will cheerfully exchange sizes and adjust errors.
—Experienced shoppers will give your order the same careful attention which you yourself would receive if you came to the store.
—Write for quotations on Women's Overalls, Khaki Outing Apparel, or, in fact, for anything you may require in dry goods or household needs.
—Ask for information regarding our big July Furniture Sale.

COME INTO THE GARDEN, MAUD

(With apologies to Mr. Tennyson)

Come into the garden, Maud,
For the black bat, night, has flown,
Come into the garden, Maud.
I'm tired of working alone.
Bring the garden hose and the rake and the hoe,
And don't mind about your hair;
There's a lot to be done before breakfast, you know,
And we're not the first to be there.

Come into the garden, Maud.
The gophers are taking the peas.
Quick, into your peggy jeans!
This isn't the time for ease.
Bring the new box trap and the gopher-go
And the cat with her kittens three.
We must wage a war on our burrowing foe,
As real as that on the sea.

Come into the garden, Maud.
The linnets are eating the corn;
The quail have nibbled the melon vines;
They were out at the first streak of morn.
Bring father's old coat and brother's old hat,
And hang them where all can see;
The impudent things may scare at that.
They don't care a rap for me.

Come into the garden, Maud.
The hoe has virtues rare;
'Twill bring the pink to your cheek
And a cunning curl to your hair.
'Twill send the blood through your veins with a whirl,
And stretch every muscle taut.
The healthy glow of the gardening girl
Is something that can't be bought.
—Jean A. Koethen in Riverside Press.

SAVING BY THINKING

Written for California Cultivator
By Mrs. D. W. C.

NO two households are just alike, so each housewife must meet her problems in her own way; yet about the same work is to be done in each home, and it is worth one's time to find the easiest and quickest way to do it.

Decide what is really necessary for the comfort and happiness of your family, and if some things can be left out, do so. Have certain days for certain tasks as much as possible, but not at the expense of your health. Try doing all the work in one part of the house before going to another. Then stop a moment and think what you need to take with you, that needs to be put away or you need in doing the work to which you are going.

On washing and cleaning days try having something on hand that can be quickly prepared for lunch, so your work need not be interrupted.

In a home with a baby a great labor saver is a baby bed on wheels that is small enough to go through doors. Ours is a homemade affair and quite inexpensive. While about my morning work I put what I shall need for baby's bath in the foot of his bed, and at bath time need only wheel him to where I bathe him. I take him to the porch to sleep and to the sewing room when I sew, taking his bottle and what I shall need along. We have the sides high enough so that baby is safe. He almost lives in that bed and I carry him very little. Try hanging baby's pads on the line and turning the hose on them. They need be scalded only once or twice a week, and I rinse them with the hose even then. It saves lifting them. I rinse all quilts and extra heavy pieces in the same way.

Surely everyone has stopped ironing bedclothes, especially in summer time, when they can be put on the bed fresh from the line. Many hospitals do that now, saying it rests the patients.

Crepe tablecloths can be bought now; also made by neatly whipping two lengths of a heavy crepe together. White oilcloth is still less work, but the crepe cloths can be used for dinner anyway and somehow one enjoys a dinner more with a pretty tablecloth on the table.

I find the dark riplettes very nice for children's clothes, the little aprons, petticoats, bloomers and rompers. One must keep the children clean and well enough dressed to command self-respect, but fancy clothes are unnecessary. Get material that doesn't fade. It lasts longer and saves much washing.

Let the children help. They want to. It will teach them valuable lessons and save you. Give them the lower drawers of dressers so they can soon fold away their clothes, also get them when needed. Have their stockings and shoe bags low so they can reach them; also the laundry bag so they can put away their own soiled clothing.

Give each a place in the closet, having low hooks so they can hang away and get their own clothing.

Teach them to throw back their beds, put away night clothing, wash and brush their teeth before coming to breakfast. It soon becomes a habit (with a little reminding).

A low stool kept under the kitchen sink saves many steps for mother. Drinks can be gotten, also things from the cupboard, and it serves a good purpose for the little girl to stand on while washing dishes.

Give them tasks to do that they like, even if mother must touch things up a bit. Dusting and dishwashing grow monotonous. Mine love to wash vegetables, whip eggs, stir things, make toast, etc.

Keep the children rested and contented. A story read after lunch time, having them lie quietly while reading, will, if it does not put them to sleep, rest them, and they will be more pleasant in the evening, which is often a trying time for little folks and grownups as well.

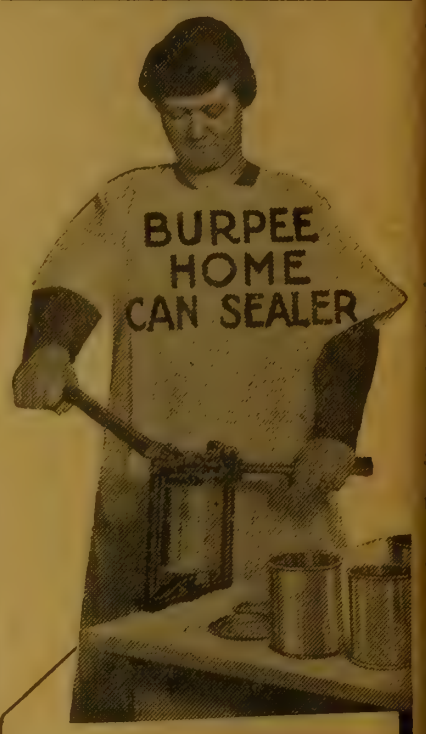
Take time to rest. A rest of 15 minutes in a darkened room makes one feel like new. It is often the quickest way to get one's work done. The best housekeeper is the one who economizes both her time and her strength and does not waste them on unnecessary tasks, always remembering that her health is a more valuable asset than a spotless kitchen, rich dishes on the table, or fine clothes.

SAVING STRENGTH

Written for California Cultivator
By Mrs. May Buerkle, Whittier.

YOU ask Culitvator housewives to tell how they save strength doing their work. I am not much of a writer, but will try to tell you some of the things which have proved great helps to me.

I think the greatest help is to use your head. There are eight in our family, five young children, seven to 14 years, grandma, who is a helpless invalid, my husband and myself. I have a 12-room house to care for besides the washing, ironing, cooking, baking, sewing, etc., necessary to care for such a large family. I do all my own work with the help of my two girls out of school hours. I try to plan my work ahead The children are taught to open their beds on rising (windows are always open), so only one trip upstairs is necessary to make beds, dust floors and straighten bathroom. I have bare floors with small



CAN YOUR OWN PRODUCTS

Don't throw your surplus fruits and vegetables to the hogs. Turn them into profit. Can them with a BURPEE HOME CAN SEALER. Then sell them at top prices, or keep them for your own use.

No Solder Needed!

No solder nor acid are required with the BURPEE HOME CAN SEALER. Seals sanitary cans absolutely airtight. So simple a child can use it. So cheap that no home can afford to be without it. It's the greatest canning device of the age. Clamps to any kitchen table. Satisfaction absolutely guaranteed or money back.

Send for Free Book

It tells all about the simple, easy method of canning fruits, vegetables and meats. A book of recipes compiled with the assistance of U. S. Dept. of Agriculture is sent free with each sealer.

Write for full information.

rugs which are easy to clean. A broom, dustless mop and dustpan are kept upstairs.

Have a place for everything and teach the children to keep things in their proper places. I had a row of hooks placed low in the closets so the small children can hang up their clothes and get them down easily. This saves having to pick them up from a chair or floor and put them away myself. Before making a trip upstairs, down cellar or into the yard, I always try to think if there is something I can take along which would save another trip in the same direction.

I serve my family very little pastry, making simple puddings, jellies, junket in various forms, or having fresh fruit for desserts. They are much less work to prepare, are more wholesome and are enjoyed by all. When I do bake pie I bake a couple of extra crusts to be filled later with lemon or cream filling.

The fireless cooker is a great help. The food, when prepared and placed in the cooker, needs no more attention until ready to serve the meal.

I use an electric iron and vacuum cleaner, which I consider two of my greatest helps. Many who live in the country do not have electricity, but not having it I should use a good hand vacuum carpet sweeper and an iron heated with oil or gasoline. I have a small, triangular dustless mop with which I do most of the dusting. Being small, it is light and its long handle makes it unnecessary for me to stoop to dust chairs, etc., and I can reach with equal ease to tops of doors, windows and picture frames.

When I begin to feel too tired I stop all and lie down for five or ten minutes, with every muscle relaxed. This does wonders toward saving one's strength. Don't worry; try to keep a pleasant frame of mind and take things as they come, one at a time. I am afraid my letter is too long now, but hope you can use part if not all of it.

LABOR LIFTERS

Written for California Cultivator
By Elinor Rives, Burbank

THE most important one in our household is a washing machine. It runs by hand power, but with its aid I can do a washing for five—three children and two adults—in two hours, which would take an experienced "wash lady" a whole day; and the clothes are clean, too. Very few spots have need of a final rub on the washboard.

When the clothes are dry I fold towels, bed linen, etc., which I do not iron—except the company ones—then taking the hose I turn the nozzle down to a fine spray and sprinkle the remaining clothes on the line. A little practice and one can get the right degree of moisture as well as with the hand.

Ironing day I bake bread as well and utilize the fire.

Every day when I come in tired from the garden or chicken yard, or get warm over the housework and begin to feel sorry for myself because there is so much to do, I drop into a chair, the easiest one in the living room, and take up the "Cultivator" or some other good magazine, and forget my troubles for a while. In a few minutes I am rested and can "take up the labor of life again" with a new viewpoint.

During the warm summer months we have simple desserts, fresh fruit, bread pudding, etc. They are better for the children as well as easier.

While ironing I cook a big soup-bone; this supplies us with meat for three dinners, soup, potpie and hash.

I have a little oil stove in the basement where I can do my canning, thus keeping the kitchen clean and the house cool. The recent warm days we spent outdoors, as anything akin to camping "makes a hit" with my family. We laid a few bricks on top of each other with a piece of sheet iron over all, and lo! a stove where one could cook a three-course meal—all but baking. With a small table under the pepper tree we were perfectly comfortable the warmest day.

I have found that one good way to save one's strength is to "make things fly" while one is at it, too. One doesn't get any warmer or any more tired, and so much more is accomplished.

And then sometimes when we are through supper and the children hustled off to bed I "call it a day," stack the dishes in the sink and turn water on them and sit down and read the evening paper with my husband.

Above all, I try to keep sweet, for "it's worry, not work, that kills."

SAVING STRENGTH SYSTEMATICALLY.

Written for California Cultivator
By Mrs. Geo. H. Pettengill

SINCE childhood I have been a lover of the great outdoors and the vast open spaces, and likewise, when I open one of our 19 magazines, do I search out the article on the "vast open spaces." Hence this little speech of mine will be given in tabulated and tabloid doses, to save your strength and mine.

Thou shalt not stoop, squat nor stretch, but shalt have thy pots, pans and other paraphernalia within comfortable reach of thy hands.

Thou shalt gather up all the fillers of the ice box and not convey them thither in solitary state.

Thou shalt "tidy up" thy living room by standing beside the main catch-all and arranging in huge piles the debris belonging in the four (or 40) other corners of the house, and then going thereto with thy spoils.

Thou shalt have a dustless mop with a two-foot handle, with which to dust the high and lowly.

Thou shalt break some of thy useless bric-a-brac before thou breakest thy back burnishing it.

Thou shalt have a two-plate gas burner, elevated two feet from the floor, and nestled up close to the end of the wash tray, that the clothes may be lifted directly from the boiler into the tub.

Thou shalt sweep less and vacuum more.

Thou shalt vacuum more and dest less.

Thou shalt not spend hours in preparing elaborate dishes at the expense of thy disposition and thy family's digestion.

Thou shalt not sweep on "sweep day" if thou art physically unfit; the heavens will not fall.

Thou shalt not forget to train thy children to wait on thee; otherwise thou wilt soon be their slave.

Thou shalt apportion the household duties, else they will all be thy portion.

Thou shalt train thyself and thy family in the ways of quietness, for from thy nerves thou must daily exact untold service.

Thou shalt go about thy daily tasks with a song on thy lips or in thy heart.

Thou shalt not sacrifice thy strength to nonessentials.

Thou shalt not neglect thy dentist, thy oculist nor thy physician.

Thou shalt jealously guard thy health and strength, for they hold the key to thy disposition and the dispositions of the whole family take their cue from thee.

Thou shalt not neglect thy God, for "The way of the Lord is strength to the upright." (Prov. 10:29.)

STRENGTH, HEALTH, HAPPINESS

Written for California Cultivator
By Mrs. Laura Dickson, Fontana

WORRY is the greatest drain on strength and the hardest to overcome. But one can with persistence work wonders.

First of all, have plenty of fresh air in the sleeping room, or sleep out of doors.

Begin the day early and take a few minutes' rest in the middle of the forenoon. Complete relaxation for 15 minutes is necessary.

Wear comfortable shoes, with commonsense heel. Clothes to fit snug, but not tight, and take physical culture or common sense beauty exercises while doing the morning work.

Straighten the back, elevate the chest, breathe to the bottom of the lungs; step squarely on your feet and see how much easier the sweeping will be.

You will soon find that many of the exercises can be put to work to save strength. Rubbing on the washboard is the best exercise to straighten the shoulders. Have the tub high enough to work comfortably; stand firm on both feet, breathe deeply, and it will bring all the muscles in your body to work together.

Save all the steps you can and sit down to every task that you possibly can. Arrange the ironing board so as to sit comfortably while ironing.

Start the bread sponge at noon and mix into a hard loaf at night after the children are asleep and put it into the pans in the morning before they are awake.

Give the children a light supper and put them to bed as soon as the twilight is over. Let everything else drop and give them their bedtime stories and lullabys. Then you and father can have the long, quiet evenings to yourselves.

Your shoulders will begin to straighten, the tired, dragged-down look disappear, and the old light will come back to husband's eyes as well.

MY PET LABOR SAVINGS

Written for California Cultivator
By Mrs. F. C. Stunden, San Fernando

PERHAPS my greatest labor-saving is in washing dishes. I have a large tray I carry to the table after meals, also a rubber-bladed plate scraper. The plate scraper also saves soap, as it scrapes the dishes practically clean. After scraping and piling dishes they can all be carried in one or two trips. Now a soap shaker saves time and uses up scraps of soap. I stack dishes in a wire dish drawer as fast as I wash them, then pour boiling water over them, set the drainer in a draft of air, and only the silver and glasses need wiping. It is, of course, best to wipe

COOLNESS

There's nothing so cool as an oil stove for summer cooking. All the heat is concentrated on the cooking and not radiated about the kitchen.
Cooks everything any wood or coal range will cook, and cooks it better, because of the steady, evenly-distributed heat.
Use it all the year 'round—more convenient than a wood or coal stove, and more economical.
The long blue chimneys prevent all smoke and smell.
In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

the silver and glasses while hot.

I always put pots and pans to soak, then wash with a wire sink brush. Get a brush of fine wire made like a broom. It does not injure enamelware.

In sweeping I have a pail of hot water into which I often dip the broom, knock out all water possible and use broom damp, not wet. It saves both mopping and dusting.

For washing I use both a washing machine and wringer. What per cent of your clothes do you iron? Why do you iron them? Because Mrs. Jones does or because it is "the way to do"? We iron for two reasons—appearance and to give the article a smooth surface, so it will not catch dirt easily. I never iron knit underwear, hose, everyday towels, sheets or overalls. In fact, two-thirds of my ashing goes unironed. Things should be taken down thoroughly dry and folded and put away at once. The wrinkles are mostly accumulated while jammed down in the clothes basket.

PRIZE WINNERS

The cash prizes have been awarded: $2.00 to Mrs. D. W. C. for "Saving by Thinking"; $1 to Elinor Rives of Burbank for "Labor Lifters." All others published this and folowing weeks are given a year's extension of subscription for which $1.00 would pay, but really don't you think it is worth more?

The articles, all of them, are splendid, fine and helpful, with a cheery "go at it, get it done and enjoy it" spirit that is an inspiration to us all.

JULY CONTEST

"Keeping Cool, Outside and In," will be the July contest topic. Does it bring visions of ice and darkened rooms, cool porches, a living room under a shady oak, fireless cookers, "early to rise" and a siesta at noon? That's the outside; how about the in—in these long days of heat and stress, physical, financial and mental?

If the past months' contests mean anything they mean that our Cultivator housekeeper contributors will tell us all these things next month.

There's good reading in these columns these days; many a compliment comes to this desk on the quality of the contest contributions. Next month's will be eagerly read.

Prizes Offered.

For best article $2.00 cash; for second best, $1.00; all others published, entitle sender to extension of year's subscription to California Cultivator unless such extension has been already given in 1917.

With your article send name and address of one to whom you wish extension credited.

All contributions should be addressed to Household Department, California Cultivator, Los Angeles, and be mailed in time to reach this office by or before Thursday morning, July 19. They will appear in the issue of July 28. Please write on one side of paper only.

PATRIOTISM.

The other night
I went to the theater
With a lowbrow friend.
And the orchestra played
"Litle Brown Jug."
And he thought
It was the national anthem
And he stood up.
And I did, too,
Darn him.—L. A. Herald.

SAFETY FIRST

A visitor at the capital was accompanied by his small son. The little boy watched from the gallery when the House came to order.

"Why did the minister pray for all those men, papa?" he questioned.

"He didn't. He loked 'em over, and prayed for the country," was the answer.

A MALICIOUS SLANDER

"Why do you folks on earth say that war is hell?" asked Satan as he welcomed a newly arrived Shade.

"Well, it is, isn't it?" asked the Shade.

"It is not," asserted Satan. "Why, there isn't room enough in hell to accommodate this one."

POULTRY INSTITUTES

The three-day institutes held at Van Nuys high school and at Pomona high school under the direction of J. E. Dougherty, assisted by E. J. Hauser of University of California extension service, were entirely successful in point of attendance and interest shown by poultry people. Contrary to expectations the Pomona meeting was not as largely attended as that at Van Nuys. Pomona poultrymen, especially those who were members of the committee who had worked for the Pomona institute, were somewhat disappointed, but there is easy explanation of the lack of attendance in that the heat of the preceding week had been such that practically every poultryman was needed at home to provide for the comfort of his stock. Those who did attend used note books and pencils freely and took away much information on housing and yarding, feeding, incubation, brooding, price of breeding, and how to select and cull the layers. The Pomona meeting ended with a most sucessful picnic in Ganesha Park.

CONTRADICTORY

"What did Blank say about me?"

"That you owed him $10."

"Why, the lying scoundrel! Well, he can just whistle for his money now. I won't pay him one cent till I get good and ready."—Boston Transcript.

Remco Redwood

REMCO STANDARD REDWOOD PRODUCTS

REDWOOD FOR DURABILITY

"REMCO" is the trade name for products made from air-dried redwood by the Redwood Manufacturers Company, a corporation whose policy of fair dealing and perfect service has given it a reputation that is world wide and a field of activity that embraces every artery of commercial life from the deep mine water conveying pipe to the staunch modern Remco Silo.

This broad basis of activity has not in any way lessened the skill, energy and care that are expended upon products for farm use in which Cultivator readers are interested. On the contrary, it has given a complete and ample opportunity to coordinate and utilize the experience gained in the several fields for the benefit of all departments of manufacture.

The wonderful concentration of limitless experience guarantees to every purchaser the maximum of quality, perfection of design and the skillful assembling of the component parts of every finished article.

When you buy a REMCO SILO you are assured of the most perfect silo made; when you buy REMCO IRRIGATION PIPE you can be sure that your pipe will deliver the flow day after day for the present and year after year for the future; when you buy a REMCO TANK you know that you will have an available reservoir that will not leak, warp or crack, but one that will fulfill its mission through the years of your life and the lives of your children.

The careful buyer will not be influenced by the substitution salesman, but will positively and firmly insist upon REMCO products for the complete performance of the service he wants rendered. Your use of REMCO products will mean satisfaction, service and permanence on your farm.
